Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 10.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Beaumont] area used.
10 year storm 10 minute intensity = 2.300(In/Hr)
10 year storm 60 minute intensity = 0.890(In/Hr)
100 year storm 10 minute intensity = 3.410(In/Hr)
100 year storm 60 minute intensity = 1.320(In/Hr)

Storm event year = 10.0
Calculated rainfall intensity data:
1 hour intensity = 0.890(In/Hr)
Slope of intensity duration curve = 0.5300

++

Process from Point/Station 31.000 to Point/Station 32.000
**** INITIAL AREA EVALUATION ****

Initial area flow distance = 605.000(Ft.)
Top (of initial area) elevation = 2824.000(Ft.)
Bottom (of initial area) elevation = 2655.000(Ft.)
Difference in elevation = 169.000(Ft.)
Slope = 0.27934 s(percent)= 27.93
TC = k(0.530)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration = 8.866 min.
Rainfall intensity = 2.452(In/Hr) for a 10.0 year storm
UNDEVELOPED (poor cover) subarea
Runoff Coefficient = 0.843
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.000
Decimal fraction soil group D = 1.000
RI index for soil(AMC 2) = 89.00
Pervious area fraction = 1.000; Impervious fraction = 0.000
Initial subarea runoff = 7.878(CFS)
Total initial stream area = 3.810(Ac.)
Pervious area fraction = 1.000

Debris Yield Methodology

The U.S. Army Corps of Engineers, Los Angeles District Debris Method was selected to determine the sediment yield for the study watershed. The Los Angeles District Method for prediction of Debris Yield was developed to provide a systematic approach for determining the debris yield from a single flood event. The method was developed using data form coastal-draining, mountainous, Southern California watersheds with a high proportion of their area in steep, mountainous terrain. It is intended to estimate debris yield for flood events greater than those with a 5-year recurrence.

The sediment load for two locations was calculated separately. Since both watersheds are less than 3.0 square miles, the use of the following equation is appropriate.

$$\textbf{Log Dy=0.65(Log P) + 0.18(Log A) + 0.62(Log RR) + 0.12(FF)}$$

Where:

Dy = Unit Debris Yield (yd^3/mi^2)
P = Maximum 1-Hour Precipitation (inches, taken to two places after the decimal point, times 100)
RR = Relief Ratio (ft/mi)
A = Drainage Area (ac)
FF = Non-dimensional Fire Factor

The maximum 1-hour precipitation (P) for a specific flood event is determined by the Riverside County Hydrology Manual based upon the project location and storm frequency. The Relief Ratio (RR) is defined as the ratio of the elevation difference (ft) between the highest and lowest points in the watershed to the longest watercourse (mi). The Fire Factor (FF) is a non-dimensional factor for the subject watershed, which is determined to be 6.5 to be conservative,

Page 17, Debris Method, published by U.S. Army Corps of Engineers, Los Angeles District (Updated February, 2000). Computational results are presented in worksheet 1.1 and 1.2.

Worksheet 1.1 Debris Yield (Sediment Load) Estimation for Drainage Area "A"

Since the watershed is less than 3.0 square miles, the use of the following equation is appropriate.

Log Dy=0.65(Log P) + 0.18(Log A) + 0.62(Log RR) + 0.12(FF)

Where:

Dy = Unit Debris Yield (yd^3/mi^2)

P = Maximum 1-Hour Precipitation (inches, taken to two places after the decimal point, times 100)

RR = Relief Ratio (ft/mi)

A = Drainage Area (ac)

FF = Non-dimensional Fire Factor

Step 1. Determine the maximum 1-hour precipitation (P) applicable to the flood event and multiply by 100.

From Riverside County Hydrology Manual, the maximum 1-hour precipitation for this site is approximately 1.30 inches. The maximum 1-hour precipitation multiplied by 100 is 130.

Step 2. Draw the drainage boundary and determine the area of the watershed (A) in mi^2 and acre.

From the drainage area exhibit, the area of the watershed was determined to be 568.3 acres, or 0.888 mi^2.

Step 3. Determine the relief ratio (RR) of the watershed.

Locate the highest point in the watershed at the end of the longest watercourse (3,876 ft), and the lowest point (2,508 ft) at the watershed downstream; determine the difference between these two in feet. Next, determine the length of the longest watercourse (15,270

ft), in miles (2.89 mi). Express the difference between the high and low elevations (in ft) and the length of the longest watercourse (in mi) as a ratio. For drainage area "A"

3,876 – 2,508 = 1,368 ft, divided by 2.89 mi = 473.4 ft/mi.

Step 4. Determine the Fire Factor (FF) for the subject watershed.

FF is determined to be 6.5 to be conservative.

Step 5. Determine the Adjustment-Transposition Factor (A-T).

The A-T Factor is assumed to be 1.00.

Step 6. Calculate the Log (Base 10) of the factors P, RR, and A. FF and A-T are dimensionless and are used as is.

From STEP 1, Log (P) = Log (130) = 2.114

From STEP 2, Log (A) = Log (568.3) = 2.7546

From STEP 3, Log (RR) = Log (473.4) = 2.6752

From STEP 4, FF = 6.50

From STEP 5, A-T = 1.00

Step 7. Apply Equation 1 for this watershed. Solve for unit debris yield using the above values:

Log Dy = 0.65 (Log P) + 0.18 (Log A) + 0.62 (Log RR) + 0.12 (FF)

Log Dy = 0.65 (2.114) + 0.18 (2.7546) + 0.62 (2.6752) + 0.12 (6.50)

Log Dy = 1.374 + 0.496 + 1.659 + 0.780

Log Dy = 4.309

Step 8. Calculate the antilog of Dy.

AntiLog Dy = 20,370 yd^3/mi^2

Step 9. Multiply the resulting Dy by the A-T Factor to get the adjusted unit debris yield for the project.

Adjusted Dy = 1.0 (20,370) = 20,370 yd^3/mi^2

Step 10. Multiply the adjusted unit debris yield by the drainage area to determine the volume of debris.

20,370 yd^3/mi^2 x 0.888 mi^2 = total debris yield of 18,089 yd^3= 488,403 ft^3 = 11.21 ac-ft.

Worksheet 1.1 Debris Yield (Sediment Load) Estimation for Drainage Area "B"

Since the watershed is less than 3.0 square miles, the use of the following equation is appropriate.

Log Dy=0.65(Log P) + 0.18(Log A) + 0.62(Log RR) + 0.12(FF)

Where:

Dy = Unit Debris Yield (yd^3/mi^2)

P = Maximum 1-Hour Precipitation (inches, taken to two places after the decimal point, times 100)

RR = Relief Ratio (ft/mi)

A = Drainage Area (ac)

FF = Non-dimensional Fire Factor

Step 1. Determine the maximum 1-hour precipitation (P) applicable to the flood event and multiply by 100.

From Riverside County Hydrology Manual, the maximum 1-hour precipitation for this site is approximately 1.30 inches. The maximum 1-hour precipitation multiplied by 100 is 130.

Step 2. Draw the drainage boundary and determine the area of the watershed (A) in mi^2 and acre.

From the drainage area exhibit, the area of the watershed was determined to be 317.5 acres, or 0.496 mi^2.

Step 3. Determine the relief ratio (RR) of the watershed.

Locate the highest point in the watershed at the end of the longest watercourse (3,044 ft), and the lowest point (2,446 ft) at the watershed downstream; determine the difference between these two in feet. Next, determine the length of the longest watercourse (7,320 ft), in miles (1.39 mi). Express the difference between the high and low elevations (in ft) and the length of the longest watercourse (in mi) as a ratio. For drainage area "B"

3,044 – 2,446 = 598 ft, divided by 1.39 mi = 430 ft/mi.

Step 4. Determine the Fire Factor (FF) for the subject watershed.

FF is determined to be 6.5 to be conservative.

Step 5. Determine the Adjustment-Transposition Factor (A-T).

The A-T Factor is assumed to be 1.00.

Step 6. Calculate the Log (Base 10) of the factors P, RR, and A. FF and A-T are dimensionless and are used as is.

From STEP 1, Log (P) = Log (130) = 2.114

From STEP 2, Log (A) = Log (317.5) = 2.502

From STEP 3, Log (RR) = Log (430) = 2.6335

From STEP 4, FF = 6.50

From STEP 5, A-T = 1.00

Step 7. Apply Equation 1 for this watershed. Solve for unit debris yield using the above values:

Log Dy = 0.65 (Log P) + 0.18 (Log A) + 0.62 (Log RR) + 0.12 (FF)

Log Dy = 0.65 (2.114) + 0.18 (2.502) + 0.62 (2.6335) + 0.12 (6.50)

Log Dy = 1.374 + 0.450 + 1.633 + 0.780

Log Dy = 4.237

Step 8. Calculate the antilog of Dy.

AntiLog Dy = 17,258 yd^3/mi^2

Step 9. Multiply the resulting Dy by the A-T Factor to get the adjusted unit debris yield for the project.

Adjusted Dy = 1.0 (17,258) = 17,258 yd^3/mi^2

Step 10. Multiply the adjusted unit debris yield by the drainage area to determine the volume of debris.

17,258 yd^3/mi^2 x 0.496 mi^2 = total debris yield of 8,560 yd^3= 231,120 ft^3 = 5.31 ac-ft.

Preliminary Project Service Evaluation

Date: **November 16, 2015**

Project: **PM 36564**

Applicant: **Shopoff Realty Investments, L.P.**
2 Park Plaza, Suite 700
Irvine, CA 92614

Location: **Northeast of Cherry Valley Boulevard & I-10 FWY**

APN: **407-220-004, 007, 008, 009, 014, 016, 017, 413-270-012, 013**

In response to requests for development related "will serve" letters, the Yucaipa Valley Water District has implemented a policy to issue Preliminary Project Service Evaluation to identify the preliminary requirements associated with residential, commercial and institutional development projects. Since the proposed Project concepts have not been fully developed, this letter provides only the basic requirements for water, wastewater and non-potable water service. The final requirements for the Project will be included in a **"development agreement"** which is required prior to the issuance of any grading or building permits by the permitting agency.

Preliminary General Requirements: The District has not received all of the necessary information to fully evaluate the proposed project at this time. Therefore the Applicant should be aware that the following partial list of conditions is not representative of the final requirements and conditions for this Project.

1. The issuance of this Preliminary Project Service Evaluation is not a typical "Will Serve" or conditions letter and may not be used to record final subdivision maps, to obtain building permits, or to acquire vested rights regarding water and/or sewer service. Issuance of water and/or sewer service is contingent upon the proposed development meeting the requirements of the Yucaipa Valley Water District which will be provided to the Applicant in a development agreement which shall be executed prior to the issuance of any grading or building permits related to this Project.
2. The District recognizes that service conditions, market environment, environmental factors and regulatory requirements continuously change. Therefore, this Preliminary Project Service Evaluation will expire 6 months from the date of this letter. Approved water and

Directors and Officers

KENNETH P. MUÑOZ Division 1 | BRUCE GRANLUND Division 2 | JAY BOGH Division 3 | LONNI GRANLUND Division 4 | THOMAS SHALHOUB Division 5 | JOSEPH B. ZOBA General Manager and Secretary

2. The District recognizes that service conditions, market environment, environmental factors and regulatory requirements continuously change. Therefore, this Preliminary Project Service Evaluation will expire 6 months from the date of this letter. Approved water and wastewater plans also expire one year after their respective approval. The Applicant will need to resubmit water (potable and non-potable) and wastewater plans for re-evaluation one year after the plans have been approved.

3. All standard District procedures, which include payment of fees and obtaining necessary Certificates of Compliance, are to be met. Fees in effect at time of payment shall prevail (current fee schedule attached). The Applicant should schedule a meeting to discuss the current fee schedule and payment requirements.

4. The Applicant must comply with the most current rules, regulations, policies, design criteria, and construction standards of this District, as they are amended or may hereafter be amended, whether written or otherwise in effect at the time of construction.

5. The District has adopted Resolution No. 11-2008 a *Strategic Plan for a Sustainable Future*.
    a. This document requires the purchase and delivery of supplemental water supplies prior to receiving building permits as well as other conditions not contained in the Preliminary Project Service Evaluation or the development agreement.
    b. This document also requires developers to comply with the rules and regulations for non-potable use and distribution. Refer to Yucaipa Valley Water District Ordinance No. 52-2006

6. The District will require a deposit of $1,000 for the preparation of a systematic hydraulic network analysis. This analysis will be conducted after receiving the required deposit and written fire flow requirements for the Project. The systematic hydraulic network analysis must be completed prior to the execution of the Developers Agreement.

7. The Yucaipa Valley Water District provides potable water, non-potable water and wastewater service. The Project will require all three services be provided as a bundled service. The Applicant should be prepared to design connections to utilize all three services.

8. Within the service area of the Yucaipa Valley Water District are other water related facilities owned by private companies and the State of California. It is the responsibility of the Applicant to determine the impact of these facilities upon the proposed Project.

9. Slopes, walls, and structure overhangs are not allowed within any existing or proposed water or sewer easements. All existing and proposed sewer and water easements shall be a minimum of 20-feet wide with all-weather roadway surfaces and consistent with the latest District standards. Adequate separation must be maintained at all times to insure the integrity of all existing facilities.

10. The Applicant should review *the Yucaipa Valley Water Districts Standards and Drawings for Water and Sewer Facilities* to become familiar with general design and service requirements.

11. The Yucaipa Valley Water District will not allow existing or proposed water or wastewater facilities within the proximity of on-site storm water detention basins without adequate

mitigation and protection. The Applicant should coordinate the location of the on-site detention basins with the Engineering Department.

12. The Yucaipa Valley Water District has not reviewed the projected potable water, non-potable water or wastewater demand projections for this Project. The anticipated system demands will modify the preliminary requirements for on-site and off-site facilities. The Applicant should schedule a meeting with a representative from the Engineering Department to discuss this issue.

13. The Yucaipa Valley Water District has not reviewed the projected fire flow requirements for this Project. The fire flow demands will modify the preliminary requirements for on-site and off-site facilities. The Applicant should schedule a meeting with a representative from the Engineering Department to discuss this issue.

14. To properly conduct a review of the proposed infrastructure needed for this Project, the Applicant shall provide utility drawings for other facilities/infrastructure that may cause interference with the existing/proposed water and wastewater facilities. These conflicts may include, but not be limited to detention basins, storm drains, electricity, gas, cable, etc.

15. All permits related to water and wastewater facilities by other entities shall be at the expense of the Applicant.

16. The Applicant will be responsible for all fees and charges as established by the District for this Project. Including, but not limited to, the advanced payment of the time and material charges associated with plan check and inspection of water related facilities. Plan check and inspection charges are usually 15% of the facility construction cost and the Applicant shall be fully responsible for the actual cost of said services provided by the District.

17. The Applicant shall be responsible for ensuring the property is within the service boundary of the Yucaipa Valley Water District prior to the approval of a development agreement with the Yucaipa Valley Water District. All costs related to annexation proceedings shall be the responsibility of the Applicant.

18. This Preliminary Project Service Evaluation does not provide a vested right, guarantee or commitment of water or wastewater related services from the District.

19. The District reserves the right to deny water and/or wastewater service to the Project if any of the conditions contained in this letter and/or the development agreement are not satisfied.

20. Each parcel must front the District facility which serves it.

Preliminary Potable Water and Non-Potable Water Requirements: The District has not received all of the necessary information to fully evaluate the proposed Project at this time. Therefore the Applicant should be aware that the following partial list of conditions is not representative of the final requirements and conditions for this Project.

21. Potable water will need to be extended on-site and off-site to meet the needs of this project.

22. Recycled water will also need to be extended on-site and off-site to meet the needs of this project.

23. Provide the District with a recycled reservoir site of the appropriate size and proper elevation.

Preliminary Wastewater Requirements: The District has not received all of the necessary information to fully evaluate the proposed Project at this time. Therefore the Applicant should be aware that the following partial list of conditions is not representative of the final requirements and conditions for this Project.

24. On-site and off-site sewer infrastructure will be required to meets the needs of this project.

25. A contribution of $1,500.00 per EDU for downstream upgrades will be a requirement of this project.

Preliminary Site Specific Project Requirements: The District has not received all of the necessary information to fully evaluate the proposed Project at this time. Therefore the Applicant should be aware that the following partial list of conditions is not representative of the final requirements and conditions for this Project.

I have read and acknowledge the preliminary requirements in this Preliminary Project Service Evaluation letter and understand that final requirements will be determined in a Development Agreement. This letter will expire six months from the date of this letter.

RE: Interstate 10 Gateway Center Project – Memo for Proposed Offsite Waterline & Sewer Main, Yucaipa Valley Water District (YVWD)

Dear Mr. Watson:

Pursuant to the 10-23-13 meeting and discussions with Yucaipa Valley Water District (YVWD), Albert A. Webb Associates have prepared the memo for proposed offsite water and sewer improvements requested by YVWD.

Offsite Sewer Main

Per YVWD's record drawing AD 20-36, Calimesa Boulevard Interceptor Sewer – Schedule 5, the existing 8" diameter gravity sewer main and the 6" diameter sewer force main turn easterly at (MH #206) located approximately 2,250 feet south of Singleton Road intersection. From the topography MH #206 is the low spot of Calimesa Boulevard between Singleton Road and Cherry Valley Boulevard. The invert of MH #206 is 2264.54 feet. The depth of sewer main is approximately 10 feet. The MH #206 is proposed connection point if the slope works for offsite sewer main (See Figure 1 for reference). The vertical difference will be verified as the project goes.

We noticed there is an existing sewer in Calimesa Boulevard south of MH #206 to serve Calimesa Country Club (Trailer Park) located approximately 1,300 feet south of MH #206. However the size, slope and condition of said existing sewer are unknown. If said existing sewer has capacity, the connection point might be moved southerly to the MH in front of Trailer Park.

Based on the Draft Water Supply Assessment (DWSA) dated 10-8-2013, an 8-inch diameter gravity sewer main (minimum slope of 0.0040) has sufficient capacity to serve the project's 61 equivalent dwelling units (EDU).

CVAR_10908

Offsite Potable Water Pipeline

Per YVWD's Zone 12 Backbone Potable Water Pipelines exhibit dated 01/21/10, a 24" diameter water pipeline has been installed in Calimesa Boulevard from Singleton Road to approximately 2,700 feet southerly where the 24" diameter water pipe turns westerly crossing under the I-10 Freeway. The Connection is proposed at the angle point where the 24" diameter water pipeline turns. (See Figure 1 for reference).

Based on the Draft Water Supply Assessment (DWSA) dated 10-8-2013 and the latest building floor plans an 8-inch diameter water pipeline has sufficient capacity to serve 61 equivalent dwelling units (EDU). However the fire flow needed for the building will exceed the water pipeline capacity.

Considering an internal sprinkler system for the warehouse 4,000 gallon per minute (gpm) of fire flow with 4-hour duration will be required. The needed pipe size is 16-inch diameter with maximum velocity of 6.38 feet per second (fps).

The Shopoff Group (TSG) will process and get official conditions.

Offsite Non-Potable Water Facilities

No offsite non-potable facility is required at this time. However TSG will share the non-potable water facility costs upon agreement with YVWD.

Should you have any questions, please contact me at (951) 248-4329.

Sincerely,
ALBERT A. WEBB ASSOCIATES

SECTION 1: INTRODUCTION

1.1 - Purpose of Analysis and Study Objectives

This Noise Impact Analysis was prepared by FirstCarbon Solutions (FCS) to evaluate the potential for construction and operational activities associated with the San Gorgonio Crossing (proposed project) to result in offsite and onsite noise impacts. The following is provided in this report:

- A description of the study area, project site, and proposed project.
- Information regarding the fundamentals of noise.
- Information regarding the fundamentals of vibration.
- A description of the local noise guidelines and standards.
- A description of the existing noise environment.
- An analysis of the potential short-term construction-related noise and vibration impacts from the proposed project.
- An analysis of long-term operations-related noise and vibration impacts from the proposed project.
- Mitigation measures to reduce impacts associated with the project.
- Evaluation of a Residential Alternative.

1.2 - Project Location and Study Area

The proposed project is located in Township 2 south, Range 1 west, Section 30, along the north side of Cherry Valley Boulevard and east of the Interstate 10 Freeway (I-10), between the Cities of Calimesa and Beaumont, and is primarily located in an unincorporated area of the County of Riverside, California (See Exhibit 1: Regional Location Map). Approximately 17 acres of the westernmost portion of the project is located within the City of Calimesa. Most of the land around the project site is vacant and in unincorporated areas of Riverside County (See Exhibit 2: Local Vicinity Map).

The proposed project site has regional access via Cherry Valley Boulevard to the I-10 Freeway, and local access via Cherry Valley Boulevard, Brookside Avenue, and Oak Valley Parkway east, toward the unincorporated community of Cherry Valley and the City of Beaumont, and west toward the City of Calimesa.

1.3 - Proposed Project

The proposed San Gorgonio Crossing Project site totals approximately 230 gross acres, of which approximately 155 acres would be included within the developed portion of the Project (Exhibit 3). The remaining approximate 75 acres would remain as natural open space (approximately 32 percent of the Project site). The Project consists of two (2) industrial buildings which will have sizes of approximately 811,000 square feet and 1,012,760 square feet for a total of approximately 1,823,760 square feet of floor area. The two industrial buildings would include 30,000 square feet of office space.

1.4 - Existing Land Use and Sensitive Receptors

The State of California defines sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions. Schools, libraries, churches, hospitals, and residential uses make up the majority of these areas.

The project site is bordered by the City of Calimesa to the west and northwest. The areas to the south, east, and the north of the project site are within unincorporated Riverside County. The area to the northeast, north, and northwest of the site primarily consists of rolling hills with a few scattered rural residences. Most of the surrounding area is currently in a predominantly undeveloped state. A mobile-home park (Rancho Calimesa) is located approximately 0.26 miles west of the site, off Calimesa Boulevard. The I-10 Freeway is located approximately 0.35 mile southwest of the project site. Land to the south consists of scattered vacant parcels, a truck services business, and the inactive Sunny Cal Egg Ranch. The Sunny Cal Egg Ranch site has been approved as a planned community development that would comprise approximately 560 residential units at buildout. East of the project site is a mix of properties used for agriculture purposes and large-lot, rural single-family development.

Additional uses in the vicinity of the project site include a residential neighborhood east of the I-10 Freeway, directly south of Brookside Avenue, and north of the Oak Valley Golf Club. In addition, the PGA Golf Course and several developing residential neighborhoods, as well as the approved Oak Valley Specific Plan (approximately 4,000 residential units), are located across the I-10 Freeway, to the west.

SECTION 2: NOISE AND VIBRATION FUNDAMENTALS

2.1 - Characteristics of Noise

Noise is defined as unwanted sound. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Sound is produced by the vibration of sound pressure waves in the air. Sound pressure levels are used to measure the intensity of sound and are described in terms of decibels. The decibel (dB) is a logarithmic unit, which expresses the ratio of the sound pressure level being measured to a standard reference level. The 0 point on the dB scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Changes of 3 dB or less are only perceptible in laboratory environments. Audible increases in noise levels generally refer to a change of 3 dB or more, as this level has been found to be barely perceptible to the human ear in outdoor environments. Only audible changes in existing ambient or background noise levels are considered potentially significant.

A-weighted decibels (dBA) approximate the subjective response of the human ear to a broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies that are audible to the human ear.

Because decibels are logarithmic units they cannot be added or subtracted by ordinary arithmetic means. For example, if one noise source produces a noise level of 70 dB, the addition of another noise source with the same noise level would not produce 140 dB; rather, they would combine to produce a noise level of 73 dB.

2.1.1 - Noise Descriptors

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans also accounts for the annoying effects of sound. Equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human communities in the State of California are the L_{eq} and community noise equivalent level (CNEL) or the day-night average level (L_{dn}) based on A-weighted decibels (dBA). CNEL is the time-varying noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as relaxation hours) and a 10 dBA weighting factor applied to noise occurring from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during the evening hours. CNEL and L_{dn} are within one dBA of each other and are normally exchangeable. The noise adjustments are added to the noise events occurring during the more sensitive hours.

Other noise rating scales of importance when assessing the annoyance factor include the maximum noise level (L_{max}), which is the highest exponential time-averaged sound level that occurs during a stated time period. The noise environments discussed in this analysis are specified in terms of maximum levels denoted by L_{max} for short-term noise impacts. L_{max} reflects peak operating conditions and addresses the annoying aspects of intermittent noise.

2.1.2 - Tone Noise

A pure tone noise is a noise produced at a single frequency and laboratory tests have shown the humans are more perceptible to changes in noise levels of a pure tone (Caltrans 1998). For a noise source to contain a "pure tone," there must be a significantly higher A-weighted sound energy in a given frequency band than in the neighboring bands, thereby causing the noise source to "stand out" against other noise sources. A pure tone occurs if the sound pressure level in the one-third octave band with the tone exceeds the average of the sound pressure levels of the two contagious one-third octave bands by: 5 dB for center frequencies of 500 Hertz (Hz) and above; by 8 dB for center frequencies between 160 and 400 Hz; and by 15 dB for center frequencies of 125 Hz or less.

2.1.3 - Noise Propagation

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features. Sound from point sources, such as an air conditioning condenser, a piece of construction equipment, or an idling truck, radiates uniformly outward as it travels away from the source in a spherical pattern.

The attenuation or sound drop-off rate is dependent on the conditions of the land between the noise source and receiver. To account for this ground-effect attenuation (absorption), two types of site conditions are commonly used in noise models: soft-site and hard-site conditions. Soft-site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. For point sources, a drop-off rate of 7.5 dBA per each doubling of the distance (dBA/DD) is typically observed over soft ground with landscaping, as compared with a 6 dBA/DD drop-off rate over hard ground such as asphalt, concrete, stone and very hard packed earth. For line sources, such as traffic noise on a roadway, a 4.5 dBA/DD is typically observed for soft-site conditions compared to the 3 dBA/DD drop-off rate for hard-site conditions.

2.1.4 - Traffic Noise

The level of traffic noise depends on the three primary factors: (1) the volume of the traffic, (2) the speed of the traffic, and (3) the number of trucks in the flow of traffic. Generally, the loudness of traffic noise is increased by heavier traffic volumes, higher speeds, and greater number of trucks. Vehicle noise is a combination of the noise produced by the engine, exhaust, and tires. Because of the logarithmic nature of noise levels, a doubling of the traffic volume (assuming that the speed and truck mix do not change) results in a noise level increase of 3 dBA. Based on the Federal Highway Administration (FHWA) community noise assessment criteria, this change is "barely perceptible;" for reference a doubling of perceived noise levels would require an increase of approximately 10 dBA. The truck mix on a given roadway also has an effect on community noise levels. As the number of heavy trucks increases and becomes a larger percentage of the vehicle mix, adjacent noise levels increase.

2.1.5 - Stationary Noise

A stationary noise producer is any entity in a fixed location that emits noise. Examples of stationary noise sources include machinery, engines, energy production, and other mechanical or powered equipment and activities such as loading and unloading or public assembly that may occur at commercial, industrial, manufacturing, or institutional facilities. Furthermore, while noise generated by the use of motor vehicles over public roads is preempted from local regulation, the County considers the use of these vehicles to be a stationary noise source when operated on private property such as at a truck terminal or warehousing facility. The emitted noise from the producer can be mitigated to acceptable levels either at the source or on the adjacent property through the use of proper planning, setbacks, blockwalls, acoustic-rated windows, dense landscaping, or by changing the location of the noise producer.

The effects of stationary noise depend on factors such as characteristics of the equipment and operations, distance and pathway between the generator and receptor, and weather. Stationary noise sources may be regulated at the point of manufacture (e.g., equipment or engines), with limitations on the hours of operation, or with provision of intervening structures, barriers or topography.

Construction activities are a common source of stationary noise. Construction-period noise levels are higher than background ambient noise levels but eventually cease once construction is complete. Construction is performed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on each construction site and, therefore, would change the noise levels as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction related noise ranges to be categorized by work phase. Table 1 shows typical noise levels of construction equipment as measured at a distance of 50 feet from the operating equipment.

2.2 - Characteristics of Vibration

Groundborne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of groundborne vibrations typically only cause a nuisance to people, but in extreme cases, excessive groundborne vibration has the potential to cause structural damage to buildings. Although groundborne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Groundborne noise is an effect of groundborne vibration and only exists indoors, since it is produced from noise radiated from the motion of the walls and floors of a room and may consist of the rattling of windows or dishes on shelves.

2.2.1 - Vibration Descriptors

Several different methods are used to quantify vibration amplitude such as the maximum instantaneous peak in the vibrations velocity, which is known as the peak particle velocity (PPV) or the root mean square (rms) amplitude of the vibration velocity. Because of the typically small amplitudes of vibrations, vibration velocity is often expressed in decibels, is denoted as L_v, and is based on the reference quantity of 1 micro inch per second. To distinguish vibration levels from noise levels, the unit is written as "VdB."

2.2.2 - Vibration Perception

Although groundborne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. When assessing

annoyance from groundborne vibration, vibration is typically expressed as root mean square (rms) velocity in units of decibels of 1 micro-inch per second, with the unit written in Vdb. Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. Human perception to vibration starts at levels as low as 67 VdB. Annoyance due to vibration in residential settings starts at approximately 70 VdB.

2.2.3 - Vibration Sources

Offsite sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible groundborne noise or vibration. Construction activities, such as blasting, pile driving and operating heavy earthmoving equipment, are common sources of groundborne vibration. Construction vibration impacts on building structures are generally assessed in terms of peak particle velocity (PPV). Typical vibration source levels from construction equipment are shown in Table 2.

Table 2: Vibration Levels of Construction Equipment

Construction Equipment	PPV at 25 Feet (inches/second)	RMS Velocity in Decibels (VdB) at 25 Feet

Pile Driver (impact-typical)	0.644	104
Pile Driver (impact-upper range)	1.518	112
Note: Source: Compilation of scientific and academic literature, generated by FTA and FHWA.		

2.2.4 - Vibration Propagation

The propagation of groundborne vibration is not as simple to model as airborne noise. This is because noise in the air travels through a relatively uniform median, while groundborne vibrations travel through the earth, which may contain significant geological differences. Factors that influence groundborne vibration include the:

- Vibration source: type of activity or equipment, such as impact or mobile, and depth of vibration source;
- Vibration Path: soil type, rock layers, soil layering, depth to water table, and frost depth; and
- Vibration Receiver: foundation type, building construction, and acoustical absorption.

Among these factors that influence groundborne vibration, there are significant differences in the vibration characteristics when the source is underground compared to at the ground surface. In addition, soil conditions are known to have a strong influence on the levels of groundborne vibration. Among the most important factors are the stiffness and internal damping of the soil and the depth to bedrock. Vibration propagation is more efficient in stiff clay soils than in loose sandy soils, and shallow rock seems to concentrate the vibration energy close to the surface and can result in groundborne vibration problems at large distance from the source. Factors such as layering of the soil and depth to the water table can have significant effects on the propagation of groundborne vibration. Soft, loose, sandy soils tend to attenuate more vibration energy than hard, rocky materials. Vibration propagation through groundwater is more efficient than through sandy soils.

The vibration level (PPV) at a distance from a point source can generally be calculated using the vibration reference equation:

$$PPV = PPV_{ref} * (25/D)^n \text{ (in/sec)}$$

Where:

PPV_{ref} = reference measurement at 25 feet from vibration source
D = distance from equipment to the receptor
n = vibration attenuation rate through ground

According to Chapter 12 of the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment manual (2006), an "n" value of 1.5 is recommended to calculate vibration propagation through typical soil conditions.

SECTION 3: REGULATORY SETTING

Noise and vibration regulations are addressed through the efforts of various federal, state, and local government agencies. The agencies responsible for regulating noise are discussed below.

3.1 - Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves the three purposes listed below:

- Promulgating noise emission standards for interstate commerce.
- Assisting state and local abatement efforts.
- Promoting noise education and research.

The Federal Office of Noise Abatement and Control was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency limits noise exposure of workers to 90 dB L_{eq} or less for 8 continuous hours or 105 dB L_{eq} or less for 1 continuous hour.

The Department of Transportation (DOT) assumed a significant role in noise control through its various operating agencies. The Federal Aviation Administration (FAA) regulates noise of aircraft and airports. Surface transportation system noise is regulated by a host of agencies, including the Federal Transit Administration (FTA). Transit noise is regulated by the federal Urban Mass Transit Administration, while freeways that are part of the interstate highway system are regulated by FHWA. Finally, the federal government actively advocates that local jurisdictions use their land use regulatory authority to arrange new development in such a way so that "noise sensitive" uses are either prohibited from being sited adjacent to a highway or, alternately that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Since the federal government has preempted the setting of standards for noise levels that can be emitted by the transportation sources, the County of Riverside is restricted to regulating the noise generated by the transportation system through nuisance abatement ordinances and land use planning.

The Federal Transit Administration (FTA) has established industry accepted standards for vibration impact criteria and impact assessment. These guidelines are published in its *Transit Noise and Vibration Impact Assessment* document (FTA 2006). The FTA guidelines include thresholds for construction vibration impacts for various structural categories as shown in Table 3.

Table 3: Federal Transit Administration Construction Vibration Impact Criteria

Building Category	PPV (in/sec)	Approximate VdB
I. Reinforced – Concrete, Steel or Timber (no plaster)	0.5	102
II. Engineered Concrete and Masonry (no plaster)	0.3	98
III. Non Engineer Timber and Masonry Buildings	0.2	94
IV. Buildings Extremely Susceptible to Vibration Damage	0.12	90
Source: Federal Transit Administration, 2006. *Transit Noise and Vibration Impact Assessment*. May		

3.2 - State Regulations

Established in 1973, the California Department of Health Services Office of Noise Control was instrumental in developing regularity tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix," which allows the local jurisdiction to delineate compatibility of sensitive uses with various incremental levels of noise (California Department of Health, Office of Noise Control 1976).

Title 24, Chapter 1, Article 4 of the California Administrative Code (California Noise Insulation Standards) requires noise insulation in new hotels, motels, apartment houses, and dwellings (other than single-family detached housing) that provides an annual average noise level of no more than 45 dBA CNEL. When such structures are located within a 60-dBA CNEL (or greater) exterior noise contour, an acoustical analysis is required to ensure that interior levels do not exceed the 45-dBA CNEL annual threshold. In addition, Title 21, Chapter 6, Article 1 of the California Administrative Code requires that all habitable rooms, hospitals, convalescent homes, and places of worship shall have an interior CNEL of 45 dB or less due to aircraft noise.

Government Code Section 65302 mandates that the legislative body of each county and city in California adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines published by the State Department of Health Services. The guidelines rank noise/land use compatibility in terms of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable. The County of Riverside utilizes a version of these guidelines to evaluate potential noise/land use impacts.

The proposed project is also subject to review under the State of California Environmental Quality Act (CEQA). Appendix G of CEQA provides impact thresholds for potential noise and vibration impacts. The proposed project may result in a significant impact if it would result in any of the following conditions:

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- A substantial temporary increase in ambient noise levels in the project vicinity above levels existing without the project;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airstrip, expose people residing or working in the project area to excessive noise levels; and
- For a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.

3.3 - Local Regulations

Riverside County and the City of Calimesa are the local agencies responsible for adopting and implementing policies as they relate to noise levels and the project's effect on surrounding land uses. Limits for construction noise and stationary noise sources are set forth in the Riverside County Code and the City of Calimesa Municipal Code and goals. Objectives and policies intended to guide land use planning decisions as they related to noise and vibration are provided in the County of Riverside General Plan Noise Element and the City of Calimesa General Plan Noise Element. Noise level limits and planning guidelines applicable to the proposed project are presented below.

3.3.1 - Riverside County Development Code

The generation of noise from one property to another is regulated in Riverside County by Ordinance 847, which establishes noise level limits based on land use categories. Private construction projects located within one-quarter of a mile from an inhabited dwelling, are exempt from these noise level limits provided that: construction does not occur between the hours of 6:00 p.m. and 6:00 a.m. during the months of June through September; or between the hours of 6:00 p.m. and 7:00 a.m. during the months of October through May.

If project construction occurs outside of these hours, construction activities will need to comply with the noise level limits that apply to the adjacent occupied properties. In this case, the site is surrounded by properties designated for very low-density residential development to the north, east and south; and properties designated for low density residential to the west, which lie within the City of Calimesa. For receiving residential land uses, noise level limits for activities occurring outside of the above listed hours must not exceed 55 dBA L_{max} between the hours of 6:00 p.m. and 10:00 p.m. The project is also prohibited from causing noise levels at receiving residential land uses that exceed 45 dBA L_{max} between the hours of 10:00 p.m. and 6:00 a.m. during the months of June through September, and between of 10:00 p.m. and 7:00 a.m. between the months of October through May.

Property maintenance, including, but not limited to, the operation of lawnmowers, leaf blowers, etc., is also exempt from Ordinance 847 provided such maintenance occurs between the hours of 7 a.m. and 8 p.m. Heating and air conditioning equipment; and safety, warning and alarm devices, including, but not limited to, house and car alarms, and other warning devices that are designed to protect the public health, safety, and welfare are also exempt from the ordinance.

3.3.2 - Riverside County General Plan Noise Element

The Riverside County General Plan Noise Element identifies noise impact criteria depending on the noise source. Impact criteria that apply to the proposed project include criteria for transportation noise impacts to noise sensitive land uses (e.g., an airport, freeway or arterial traffic noise in residential areas); and criteria that apply to stationary noise impacts to sensitive land uses (e.g. stationary noise impacting neighboring communities). The County of Riverside has also adopted noise criteria for land use planning purposes, as shown in Table 4. These criteria set outdoor noise level standards that are acceptable, conditionally acceptable, and unacceptable, for a variety of land uses. Transportation related noise as measured inside residential dwellings should not exceed 45 L_{dn} (or CNEL); and exterior noise levels due to transportation noise at a residential parcels should not exceed 65 L_{dn} (or CNEL). Industrial land uses are considered acceptable in noise environments with noise levels that reach up to 75 dBA CNEL and are considered conditionally acceptable in noise environments with noise levels that reach up to 80 dBA CNEL. The Environmental Impact Report prepared for the County of Riverside General Plan utilizes "an increase in long-term ambient noise by 5 dBA CNEL or more" to determine if the project would result in a substantial increase in long-term ambient noise levels. The County does not identify a threshold for temporary increases in noise.

Stationary Noise Sources

Noise levels at properties that contain a "habitable dwelling, hospital, school, library, or nursing home," must not exceed the following worst-case noise levels:

- 45 dBA L_{eq} (10-minute), between the hours of 10:00 p.m. and 7:00 a.m. (nighttime standard)
- 65 dBA L_{eq} (10-minute), between the hours of 7:00 a.m. and 10:00 p.m. (daytime standard)

Source: Governor's Office of Planning and Research. 2003. State of California General Plan Guidelines, Appendix C, Guidelines for the Preparation and Content of the Noise Element of the General Plan. October. Key:						
	Normally Acceptable: Specified land use is satisfactory based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.					
	Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice. Outdoor environment will seem noisy.					
	Normally Unacceptable: New construction and development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made with needed noise insulation features included in the design. Outdoor areas must be shielded.					
	Clearly Unacceptable: New construction or development should generally not be undertaken. Construction costs to make the indoor environment acceptable would be prohibitive and the outdoor environment would not be usable.					

3.3.3 - City of Calimesa Ordinance

Section 8.15.040 of the City of Calimesa Municipal Ordinance sets noise level limits for the emission of noise from one property to another. These limits vary depending on the zoning of the source property as well as the zoning of the affected properties. The project site is currently zoned Controlled Development Area (W-2) but is proposed to be rezoned to Industrial Park (I-P) as part of the proposed project. The adjacent property west of the site and land northwest of the site is located within the jurisdiction of the City of Calimesa are zoned Commercial Regional (CR) and Residential Low Medium (RLM) respectively. The noise level limits for each zoning district are presented in Table 5.

Table 5: City of Calimesa One-Hour Average Sound Level Limit

Zone	Applicable Limit One-Hour Average Sound Level (In dBA)	
R-1, R-T, R-2, R-R and S-P regulations with a density of five dwelling units or less per acre	7:00 a.m. to 10:00 p.m.	50
	10:00 p.m. to 7:00 a.m.	40
R-3, S-P and PRD regulations with a density of six or more dwelling units per acre	7:00 a.m. to 7:00 p.m.	55
	7:00 p.m. to 10:00 p.m.	50
	10:00 p.m. to 7:00 a.m.	45
C-P-S, C-P, C-O *Commercial Regional (CR) would fall into this zone*	7:00 a.m. to 7:00 p.m.	60
	7:00 p.m. to 10:00 p.m.	55
	10:00 p.m. to 7:00 a.m.	55

Table 5 (cont.): City of Calimesa One-Hour Average Sound Level Limit

Zone	Applicable Limit One-Hour Average Sound Level (In dBA)	
M *Light Industrial would fall into this zone*	7:00 a.m. to 10:00 p.m.	70
	10:00 p.m. to 7:00 a.m.	50
Note: Italic zones are from the recently updated City of Calimesa Land Use and Zoning Map, August 23,2010. They were added in the appropriate categories. Source: City of Calimesa Municipal Ordinance Section 8.15.040		

Ordinance 8.15.040(c) clarifies that when the source property and the receiver property are located in two different zoning districts, the noise level limit is equal to the arithmetic mean of the two standards. Therefore, the applicable noise level limit for project noise projected to land uses within the RLM zone is 45 dBA L_{eq} between the hours of 10:00 p.m. and 7:00 a.m. and 60 dBA L_{eq} between the hours of 7:00 a.m. and 10:00 p.m. and the applicable noise level limit for project noise projected to adjacent land zoned CR are is 52.5 dBA L_{eq} between the hours of 7:00 p.m. and 7:00 a.m. and 65 dBA L_{eq} between the hours of 7:00 a.m. and 7:00 p.m.

In order to reduce construction noise impacts, the City of Calimesa has adopted an ordinance that sets forth restrictions that apply to construction activities. With the exception of emergency work, Section 8.15.080 of the Ordinance prohibits any person, including the city, to operate any single or a combination of powered construction equipment at any construction site before 7:00 a.m. or after 7:00 p.m. It is also unlawful for any person, including the city, to operate any single or a combination of powered construction equipment at any construction site before 10:00 a.m. or after 5:00 p.m. on Saturdays and Sundays, January 1st, the last Monday in May, known as "Memorial Day," July 4th, the first Monday in September, Thanksgiving Day and December 25th. When January 1st, July 4th, or December 25th fall on a Sunday, operation any single or a combination of powered construction equipment at any construction site before 10:00 a.m. or after 5:00 p.m. on the following Monday is also prohibited.

Further, no such equipment, or a combination of equipment regardless of age or date of acquisition, shall be operated so as to cause noise at a level in excess of 75 dBA for more than eight hours during any 24-hour period when measured at or within the property lines of any property which is developed and used either in part or in whole for residential purposes. These sound levels shall be corrected for time duration as shown in Table 6.

Table 6: City of Calimesa Construction Noise Level Limits

Total Duration in 24 Hours	Decibel Level Allowance	Total Decibel Level
Up to 15 minutes	+15	90
Up to 30 minutes	+12	87
Up to 1 hour	+9	84
Up to 2 hours	+6	81
Up to 4 hours	+3	78
Up to 8 hours	0	75

3.3.4 - City of Calimesa General Plan Noise Element

The City of Calimesa General Plan Noise Element refers to noise/land use compatibility guidelines presented in the State Office of Noise Control "Guidelines for the Preparation and Content of Noise Elements of the General Plans." In reference to potential transportation noise to the proposed project, these guidelines state that industrial land uses are normally acceptable in environments with noise levels of up to 75 dBA CNEL/L_{dn} and conditionally acceptable in environments with noise levels of up to 80 dBA CNEL/L_{dn}.

Single family and mobile homes are considered to be normally acceptable in environments with noise levels of up to 60 dBA CNEL/L_{dn} and conditionally acceptable in environments with noise levels of up to 70 dBA CNEL/L_{dn}. Projects proposed in environments with noise levels that are considered to be conditionally acceptable must have a detailed analysis of the noise reduction requirements and include the necessary insulation features in the project design. Conventional construction, but with closed window and fresh air supply systems or air conditioning normally suffice.

The City of Calimesa has not established a threshold for what is considered to be a "substantial increase." Therefore, the County of Riverside's threshold will be used for the purposes of this analysis.

SECTION 4: EXISTING NOISE ENVIRONMENT

To determine the existing noise levels, five short-term noise measurements were taken at the project site and in the project vicinity. The following describes the measurement procedures, measurement locations, and the noise measurement results.

4.1 - Ambient Noise Levels

Five noise measurements were taken on the project site and in the site vicinity in order to obtain noise measurements of the current noise sources and to provide a baseline for any potential noise impacts that may be created by development of the proposed project. Field monitoring was conducted on May 30, 2013 between the hours of 10:30 a.m. and 11:45 a.m. The field survey noted that noise within the project area is generally characterized by highway and roadway traffic noise, light aircraft and birds.

Noise monitoring was performed using an Extech Model 407780 Type 2 integrating sound level meter. The Extech meter was programmed to record the sound pressure level at 1-second intervals for in A-weighted form. The sound level meter and microphone was mounted approximately five feet above the ground and equipped with a windscreen during all measurements. The sound level meter was calibrated before monitoring using an Extech calibrator, Model 407766. The noise level measurement equipment meets American National Standards Institute (ANSI) specifications for sound level meters (S1.4-1983 identified in Chapter 19.68.020.AA). At the start of the noise monitoring, the sky was clear with calm wind conditions ranging between 0 and 3 mph.

Noise measurement locations are shown in Exhibit 4. The results of the noise level measurements are provided in Table 7. Meter output sheets are included as Appendix B.

Table 7: Existing Noise Level Measurements

Site ID #	Description	L_{eq}	L_{min}	L_{max}
1	Northwest of the site east end of Calimesa Mobile Home Ranch	51.6	48.0	55.6
2	West of the site near single family home	68.2	52.9	83.7
3	North of the site near single family homes	46.3	41.4	51.8
4	Near Northwest corner of site	50.6	46.8	55.2
5	Southeast of the site near single family homes	68.8	43.1	85.4

Note:
The Site ID corresponds to locations shown in Exhibit 4.
Source: FirstCarbon Solutions 2013.

4.2 - Ambient Vibration Levels

Aside from seismic events, the greatest regular source of groundborne vibration at the project site and in the immediate vicinity is from heavy-duty vehicular travel on local roadways. Large trucks traveling at 55 miles per hour on a smooth roadway surface can generate groundborne vibration velocity levels of approximately 75 VdB at 25 feet, and these levels could reach up to approximately 80 VdB where trucks and buses pass over bumps in the road. In terms of PPV levels, a heavy-duty vehicle traveling at 55 miles per hour on a smooth roadway surface can result in a vibration level of approximately 0.04 inches per second at 25 feet.

4.3 - Existing Traffic Noise Levels

Existing traffic noise levels along selected roadway segments in the project vicinity were modeled using the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). Site-specific information is entered, such as roadway traffic volumes, roadway active width, source-to-receiver distances, travel speed, noise source and receiver heights, and the percentages of automobiles, medium trucks, and heavy trucks that the traffic is made up of throughout the day, amongst other variables. The modeled average daily traffic (ADT) volumes were obtained by multiplying by a factor of ten the PM peak hour intersection traffic volumes from the Project-specific traffic study (Urban Crossroads 2014). The model inputs and outputs, including the 60 dBA, 65 dBA, and 70 dBA CNEL traffic noise contour distances, are provided in Appendix A of this report. A summary of the modeling results is shown in Table 8.

The modeling results show that traffic noise levels range up to 67 dBA CNEL at the southern limits of the Project site adjacent to Cherry Valley Boulevard. According to the County's land use compatibility guidelines, environments with noise levels of up to 70 dBA CNEL are considered "normally acceptable" for new office, business, and commercial land use development. For industrial, manufacturing, utilities, and agriculture land uses, environments with noise levels of up to 75 dBA CNEL are considered "normally acceptable."

Table 8: Existing Traffic Noise Levels

Roadway Segment	ADT	Center-line to 70 CNEL (feet)	Center-line to 65 CNEL (feet)	Center-line to 60 CNEL (feet)	CNEL (dBA) 50 feet from Centerline of Outermost Lane
Cherry Valley Boulevard - Calimesa Boulevard to Driveway 1	6,200	< 50	76	163	67.0
Cherry Valley Boulevard - Driveway 1 to Street 2	6,200	< 50	76	163	67.0
Cherry Valley Boulevard - Street 2 to Driveway 3	6,200	< 50	76	163	67.0
Cherry Valley Boulevard - Driveway 3 to Union Street	6,200	< 50	76	163	67.0
Cherry Valley Boulevard - Union Street to Nancy Street	5,000	< 50	< 50	101	63.9

Table 8 (cont.): Existing Traffic Noise Levels

Roadway Segment	ADT	Center-line to 70 CNEL (feet)	Center-line to 65 CNEL (feet)	Center-line to 60 CNEL (feet)	CNEL (dBA) 50 feet from Centerline of Outermost Lane
Cherry Valley Boulevard - Nancy Street to Beaumont Avenue	4,600	< 50	< 50	96	63.5
Union Street - South of Cherry Valley Boulevard	300	< 50	< 50	< 50	51.7
Nancy Street - South of Cherry Valley Boulevard	1,400	< 50	< 50	< 50	58.3
I-10 - north of Cherry Valley Boulevard interchange	6,800	79	151	315	68.7

SECTION 5: PROJECT IMPACT ANALYSIS AND MITIGATION

5.1 - Construction Noise Impacts

Neither the City of Calimesa nor the County of Riverside have established a numerical threshold for what they consider a "substantial increase" in ambient noise levels for construction noise. The EIR prepared for the County of Riverside General Plan (2003) indicates that construction noise has the potential to significantly impact off-site sensitive receptors and that compliance with the County's noise ordinance construction hours would be required to reduce construction-related noise impacts to a less than significant level. The EIR also recommends several other measures to reduce construction noise impacts.

Project construction activities have the potential to cause short-term impacts to the rural single-family homes in the project area. Construction noise may also be audible at the Rancho Calimesa Mobile Home Ranch located west of the project site near the I-10 freeway.

Construction noise will vary depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work. Typical noise sources and noise levels associated with construction activities are shown in Table 1.

Both mobile and stationary construction equipment will be used on the site. Mobile equipment (e.g., loaders, graders, dozers) moves around a construction site performing tasks in a recurring manner. Stationary equipment (e.g., air compressor, generator, concrete saw) operates in a given location for an extended period of time to perform continuous or periodic operations.

The initial phase of project construction would involve mass grading which would be followed by fine grading, trenching, and paving activities. Construction of the proposed buildings would include building construction, architectural coatings application, and paving associated with buildings. The mass grading phase is widely recognized to be the loudest part of construction. Construction equipment that will be used during the mass grading phase will include scrapers, loaders backhoes, excavators, dozers, and trucks. Operational characteristics of this equipment when associated with mass grading are typified by short periods of full power operation followed by extended periods of operation at lower power, idling, or powered-off conditions. A typical cycle for these machines includes between 1 and 2 minutes of full power operation followed by 3 to 4 minutes of lower power. Blasting and the use of pile drivers are not anticipated.

A worst-case construction noise level was calculated using the Road Construction Noise Model (RCNM) provided by the FHWA. RCNM utilizes standard noise emission levels for many different types of equipment and includes utilization percentage, impact, and shielding parameters. The modeled scenario assumed the simultaneous use of some of the loudest types of heavy construction equipment, including two graders, one dozer and one scraper at reasonably expected distance from

each other. A 40 percent usage factor was assumed for each piece of equipment. Modeling output and modeling parameters and output are provided in Appendix C.

As shown in Table 9, project construction activities would result in temporary substantial increases in ambient noise levels at nearby sensitive receptors. These are worst-case noise levels that can be expected to lower at sensitive receptors as construction moves away from the property line. It should be noted that a ridgeline breaks the line of sight between the project site and the Calimesa Mobile Home Ranch and a deduction of 10 dBA was taken from construction noise calculations to take this intervening topography into consideration. Similarly, existing hills and ridgelines block the line of site from the homes north of the project site to the project, thus a deduction of 10 dBA was taken to account for this shielding. Potentially affected Sensitive Receptor locations are shown in Exhibit 2.

Table 9: Comparison of Existing Ambient and Construction Noise Levels

Sensitive Receptor[1]	Location - Distance/Direction from Site	Ambient Noise Level dBA L_{max}/L_{eq}	Construction Noise Level dBA L_{max}/L_{eq}	Temporary Increase due to Construction Noise dBA L_{max}/L_{eq}
East end of Mobile Home Ranch	City of Calimesa - 1500 feet northwest of nearest construction footprint	56/52$^{(NM1)}$	46[2]/47	0/0
Single family home	City of Calimesa - 850 feet west of nearest construction footprint	84/68$^{(NM2)}$	60/62	0/0
Single family home	County of Riverside - 1200 feet north of nearest construction footprint	52/46$^{(NM3)}$	47[2]/49	0/3
Single family home	County of Riverside - 1600 feet north of nearest construction footprint	52/46$^{(NM3)}$	45[2]/47	0/1
Single family home	City of Calimesa - 670 feet west of nearest construction footprint	55/51$^{(NM4)}$	63/64	8/13
Single family homes	County of Riverside - 110 feet to southeast of nearest project driveway construction area	85/69$^{(NM5)}$	78/78	0/9

Notes:
[1] Sensitive Receptor locations are shown in Exhibit 2.
[2] An extra 10 dB was deducted due to intervening topography.
NM = Noise Measurement Location

If construction does not occur between the hours of between the hours of 6:00 p.m. and 6:00 a.m. during the months of June through September; or between the hours of 6:00 p.m. and 7:00 a.m.

during the months of October through May it is exempt from the County of Riverside Noise Ordinance. As mentioned previously, Section 8.15.080 of the City of Calimesa Municipal Ordinance prohibits construction noise before 7:00 a.m. or after 7:00 p.m. Mondays through Fridays and before 10:00 a.m. or after 5:00 p.m. on Saturdays and Sundays, on holidays, and on the Monday following each holiday that falls on a Sunday. The City of Calimesa has also established noise level limits for construction activities (see Table 6). In this case, the applicable threshold is 75 dBA L_{eq} (8-hour).

The worst-case construction noise level expected at the City of Calimesa home located adjacent to the western project boundary is 64 dBA L_{eq}. This worst-case noise level is below the City's noise level limit for construction activities and can be expected to lower as construction moves away from the property line. In addition, such construction noise levels are unlikely to continue for eight continuous hours, because equipment would not remain operating all day at the nearest construction limits.

As shown in Table 9, construction activities would result in substantial temporary increases (an increase of more than 5 dBA) in ambient noise levels at the home within the City of Calimesa immediately west of the site when multiple pieces of heavy construction equipment operate simultaneously near the westernmost portion of the project site. Similarly, the closest home located southeast of the project site could experience a substantial temporary increase in noise levels when multiple pieces of heavy construction equipment operate simultaneously at the nearest project construction limits. To reduce this potential impact, the following mitigation measures would be implemented.

Level of Significance Before Mitigation

Potentially significant impact due to temporary substantial increase in noise levels.

The following mitigation measures are recommended to reduce construction noise impacts.

Mitigation Measures

MM NOI-1a During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturers' standards. This would result in an estimated 5 dBA reduction (perceived as half as loud) in equipment operational noise levels compared to operations without such devices.

MM NOI-1b Whenever feasible, the construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site. This would result in an estimated 5 dBA reduction (perceived as half as loud) in operational noise levels compared to operations with noise emitted toward a receptor.

MMNOI-1c The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise sensitive receptors nearest the project site during all project construction.

MNNOI-1d All on-site noise producing construction activities (including haul truck deliveries) shall be restricted to the hours from 7:00 a.m. to 7:00 p.m. Mondays through Fridays and 10:00 a.m. to 5:00 p.m. on Saturdays and Sundays, on holidays, and on the Monday following each holiday that falls on a Sunday. To the extent feasible, haul routes should not pass sensitive land uses or residential dwellings.

MNNOI-1e For the duration of construction activities, the construction manager shall serve as the disturbance coordinator, should noise levels become disruptive to local residents. The disturbance coordinator would determine the cause of the noise complaints (starting too early, bad muffler, etc.) and institute reasonable measures warranted to correct the problem. The construction manager shall conspicuously post a telephone number for the disturbance coordinator at all entrances to the construction site.

Level of Significance After Mitigation

Less than significant impact. Implementation of this multi-part mitigation measure would ensure compliance with the City's and County's construction noise ordinances, as well as would further reduce potential noise impacts, to the extent feasible, that could cause discomfort or annoyance for a reasonable person residing or working in the immediate project vicinity and would reduce construction noise operational noise levels to not result in a substantial increase in ambient noise levels at off-site sensitive land uses.

5.2 - Operational Noise Impacts

5.2.1 - Traffic Noise Impacts

A significant impact would occur if the Project would be exposed to noise levels of the City's "normally compatible" standard of 60 dBA CNEL for new residential land use development, or if the project would result in a substantial increase in traffic noise levels compared to noise levels existing without the project. The Environmental Impact Report prepared for the County of Riverside General Plan utilizes "an increase in long-term ambient noise by 5 dBA or more" to determine if the project would result in a substantial increase in long-term ambient noise levels.

Regional access to the project site will be provided by the I-10 Freeway via Cherry Valley Boulevard. Local access to the project site will be provided along Cherry Valley Boulevard via two driveways and one proposed public street. The public street will allow full-access and the driveways will allow right-in/right-out access only. There are single-family residential properties along Cherry Valley Boulevard, Nancy Street, and Union Street that may be affected by project generated traffic noise.

The FHWA highway traffic noise prediction model (FHWA RD-77-108) was used to evaluate traffic-related noise conditions in the vicinity of the Project site. Traffic data used in the model was obtained from the traffic impact analysis prepared by Urban Crossroads (2014). The resultant noise levels were weighed and summed over a 24-hour period in order to determine the CNEL values. The modeled average daily traffic (ADT) volumes were obtained by multiplying the PM peak hour intersection traffic volumes by a factor of ten. As a worst-case analysis, future roadway widening that is would occur with

implementation of the project was assumed for both without project and with project future conditions. The traffic noise modeling input and output files are included in Appendix A of this report. Table 10, Table 11, and Table 12 summarize the traffic noise modeling results for existing, cumulative (year 2017), and horizon (year 2035) traffic conditions, without and with the Project.

The highest traffic noise levels on segments of Cherry Valley Boulevard adjacent to the project site would occur under horizon (year 2035) traffic conditions with implementation of the project. Based on the traffic noise modeling results shown in Table 12, the Project site would be exposed to traffic noise levels ranging up to approximately 73.2 dBA CNEL at 50 feet from the centerline of the nearest travel lane of Cherry Valley Boulevard, under horizon (year 2035) plus Project traffic conditions. At the nearest façade of the proposed warehouse buildings, located approximately 465 feet from the centerline of Cherry Valley Boulevard, these traffic noise levels would attenuate to below 57 dBA CNEL.

According to the County's land use compatibility guidelines, environments with noise levels of up to 70 dBA CNEL are considered "normally acceptable" for new office, business, and commercial land use development. For industrial, manufacturing, utilities, and agriculture land uses, environments with noise levels of up to 75 dBA CNEL are considered "conditionally acceptable." Therefore, traffic noise impacts to the proposed project would be less than significant and no mitigation would be required.

Table 10: Existing without- and with-Project Modeled Roadway Noise Levels

Roadway Segment	Existing No Project ADT	Existing No Project (dBA) CNEL	Existing + Project ADT	Existing + Project (dBA) CNEL	Increase over Existing No Project (dBA)
Cherry Valley Boulevard - Calimesa Boulevard to Driveway 1	6,200	67.0	9,300	67.7	0.7
Cherry Valley Boulevard - Driveway 1 to Street 2	6,200	67.0	8,900	67.5	0.5
Cherry Valley Boulevard - Street 2 to Driveway 3	6,200	67.0	6,600	66.2	-0.8
Cherry Valley Boulevard - Driveway 3 to Union Street	6,200	67.0	6,500	66.1	-0.9

Source: FirstCarbon Solutions 2014.

Modeling results also show that project generated vehicle noise on area-wide roadways would result in a maximum increase of up to 0.9 dBA in traffic noise levels with implementation of the project compared to traffic noise levels existing without the project. This highest increase would occur under cumulative (year 2017) plus Project traffic conditions. The County of Riverside considers a permanent increase of 5 dBA or greater to be a substantial increase. Therefore, an increase in 0.9 dBA is not considered substantial, and Project generated traffic noise would result in a less than significant impact on off-site sensitive receptors along area-wide roadways.

It should be noted that two roadway segments under Existing plus project conditions (as shown in Table 10) would experience an apparent decrease in traffic noise levels as measured at 50 feet from the centerline of the outermost travel lane. However, this apparent reduction only occurs because the existing plus project conditions assumes implementation of planned roadway improvements that would widen the portion of Cherry Valley Boulevard that is adjacent to the project site to a four-lane roadway. This improvement essentially moves traffic further away from the outermost travel lane, thus "reducing" the traffic noise levels measured at that distance. However, this reduction would not be distinguishable compared to existing conditions and should therefore be assumed to be equivalent to no increase.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation

No mitigation measures are required.

Level of Significance After Mitigation

Less than significant impact.

5.2.2 - Stationary Noise Impacts

Potential long-term on-site stationary noise impacts would be associated with operations at the proposed light industrial and warehouse land uses. The proposed project would generate noise from truck delivery, loading/unloading activities at the loading areas, and air conditioning systems. A brief discussion of the types of noise that can be expected to occur with project implementation is presented below.

Parking Lot Noise/Truck Loading and Unloading

Potential long-term on-site stationary noise impacts would be associated with operations at the proposed light industrial and warehouse land uses. The proposed project would generate noise from truck delivery, loading/unloading activities at the loading areas, and other noise-producing activities at the parking lot such as customers conversing, doors slamming, engine startup, and slow-moving vehicles. These activities are potential point sources of noise that could affect noise-sensitive receptors near the loading areas and parking lots, including single-family residences located to the west, north, east and southeast. Of these noise sources, noise from truck delivery loading/unloading would result in the highest noise levels at off-site sensitive receptors.

Representative parking activities, such as vehicles cruising at slow speeds, door slamming, cars starting, would generate approximately 60 dBA to 70 dBA L_{max} at 50 feet. Conversation between two persons at a distance of 3 to 5 feet apart would generate a noise level of 60 dBA L_{eq} at 5 feet, or approximately 40 dBA L_{eq} as measured at 50 feet.

Noise would also be generated by truck delivery, loading/unloading activities at the loading areas of the proposed warehouse facility. Typical noise levels from larger delivery truck loading and unloading activities can range from 75 dBA to 85 dBA L_{max} as measured at 50 feet. Typical truck unloading process takes an average of 15 to 20 minutes, typically generating noise levels of up to 60.4 dBA L_{eq} at a distance of 50 feet.

Loading and unloading areas associated with the project face the northern, western, and southern project property lines. The closest residential land use to the west of the project site is located approximately 870 feet from the closest Project truck bays and loading areas. At this distance, activity at the project's western truck bays of multiple trucks loading/unloading simultaneously could result in intermittent noise levels of up to 60 dBA L_{max} and a combined hourly average noise level of 58 dBA L_{eq10}.

The closest residence to the project's south facing loading area is located approximately 1,000 feet to the southeast across Cherry Valley Boulevard. At this distance, activity at the project's southern

truck bays of multiple trucks loading/unloading simultaneously could result in intermittent noise levels of up to 59 dBA L_{max} and a combined hourly average noise level of 52 dBA L_{eq10}.

Project operational noise associated with loading, loading and other parking lot noises would not be audible at the Rancho Calimesa Mobile Home Ranch or at the homes located north and east of the project site due to distance from the site and intervening topography. Noise associated with loading/unloading activities would potentially affect the residences located west and southeast of the project site. Project operational noise that can be expected at these residences are summarized in Table 13.

Table 13: Comparison of Existing Ambient and Maximum Operational Noise Levels

Sensitive Receptor[1]	Measured Ambient Noise Level (dBA L_{eq}	Operational Noise Level at Residential Façade	
		dBA L_{max}	dBA L_{eq}
Residential Property west of project site	52 (NM4)	60	58
Residential Property southeast of project site	69 (NM5)	59	52
Notes: Receptor locations are shown in Exhibit 2. NM = Noise Measurement Location			

The existing residence adjacent to the west of the project site is located within the City of Calimesa and zoned Commercial Regional (CR). As discussed previously, the applicable noise level limits for project operational noise projected to property zoned CR are is 52.5 dBA L_{eq} between the hours of 7:00 p.m. and 7:00 a.m. and 65 dBA L_{eq} between the hours of 7:00 a.m. and 7:00 p.m. As shown in Table 13, projected operational noise levels could range up to 58 dBA L_{eq} when multiple truck loading/unloading operations occur simultaneously at the nearest loading areas of the project site. These operations could, therefore, exceed the City's nighttime operational noise level standard unless mitigation is incorporated. Inclusion of loading bay doors equipped with sealed gaskets would be expected to reduce loading/unloading maximum operational noise levels by at least 15 dBA. This would effectively reduce loading/unloading operational noise levels to below a combined hourly average noise level of 43 dBA L_{eq}, meeting the City of Calimesa's nighttime operational noise standard of 52.5 dBA L_{eq}. With implementation of this measure, loading/unloading operational noise impacts would be reduced to less than significant.

The County of Riverside prohibits noise levels from exceeding 45 dBA L_{eq10}, between the hours of 10:00 PM and 7:00 AM (nighttime standard) and from exceeding 65 dBA L_{eq10} between the hours of 7:00 AM and 10:00 PM (daytime standard) at residential properties. These standards apply to operational noise projected to the homes located southeast of the site. These operations could, therefore, exceed the County's nighttime operational noise level standard unless mitigation is incorporated. Inclusion of loading bay doors equipped with sealed gaskets would be expected to reduce loading/unloading maximum operational noise levels by at least 15 dBA. This would effectively reduce loading/unloading operational noise levels to below a combined hourly average noise level of 37 dBA L_{eq10}, meeting the County of Riverside's nighttime operational noise standard of

45 dBA L_{eq10}. With implementation of this measure, loading/unloading operational noise impacts would be reduced to less than significant.

Heating, Ventilating, and Air Conditioning Equipment Noise

The proposed project would have rooftop heating, ventilating, and air conditioning (HVAC) equipment. Although no final design is available at this time for the type and location of the rooftop mechanical units, based on noise measurements conducted at a similar use, rooftop HVAC units generate noise levels of approximately 62 dBA L_{eq} at 50 feet and the roof edge (parapet) creates a noise barrier that reduces noise levels from rooftop HVAC units by an additional 3 to 5 dBA or more from ground floor receptors. The closest sensitive receptor to the west of the project site is the residence located approximately 880 feet from the nearest proposed building façade and an estimated 900 feet from the nearest possible location for proposed rooftop HVAC units. At this distance operational noise levels of the proposed HVAC units would attenuate to below 37 dBA L_{eq}. This is below the existing measured ambient noise level in the vicinity of this receptor, and well below the both the daytime and nighttime operational noise standard of the City of Calimesa.

Similarly, HVAC operational noise levels would result in noise levels below the County of Riversides daytime and nighttime operational noise standards. The closest receptor is the residence to the southwest located approximately 880 feet from the nearest proposed building façade and an estimated 900 feet from the nearest possible location for proposed rooftop HVAC units. At this distance operational noise levels of the proposed HVAC units would attenuate to below 37 dBA L_{eq}. This is below the existing measured ambient noise level in the vicinity of this receptor.

Therefore, noise from operation of proposed rooftop HVAC units would not result in violations of County of Riverside Code or City of Calimesa Municipal Ordinance and would result in a less than significant impact.

Level of Significance Before Mitigation

Potentially significant impact due to loading/unloading operational noise levels exceeding local nighttime operational noise level standards.

The following mitigation measures are recommended to reduce loading/unloading operational noise impacts.

Mitigation Measures

MM NOI-2 All project loading bays shall be equipped with sealed gasket bay doors. The project applicant shall ensure that these sealed gasket bay doors are strictly used for all nighttime loading/unloading operations. Inclusion of loading bay doors equipped with sealed gaskets would be expected to reduce loading/unloading maximum operational noise levels by at least 15 dBA. This would effectively reduce loading/unloading operational noise levels to below a combined hourly average noise level of 37 dBA L_{eq10}, meeting the County of Riverside's nighttime operational noise standard of 45 dBA L_{eq10}.

Level of Significance After Mitigation

Less than significant impact with mitigation measures incorporated.

5.3 - Groundborne Vibration Impacts

The County of Riverside, the City of Calimesa and the State of California have not adopted criteria or regulations for groundborne vibration or groundborne noise. Therefore, for purposes of this analysis, the annoyance and damage impact criteria of the FTA are utilized.

5.3.1 - Construction Vibration Impacts

Table 2 shows the PPV of some common construction equipment and haul trucks (loaded trucks). The most vibration-causing piece of equipment that will likely be used on-site is the vibratory roller. This machine can cause vibration strong enough to annoy people over 100 feet away. Due to the proximity of the homes located adjacent to the site to the west and southeast of the project site, construction activities may result in ground borne vibration that is annoying but is not expected to result in building damage. The annoyance would only occur during site grading and preparation activities within 100 feet of a home.

5.3.2 - Operational Vibration Impacts

Based on the data shown in Table 2, loaded trucks are not anticipated to exceed 0.076 in/sec peak particle velocity (PPV) at 25 feet. These vibration levels are below the normal perception level and well below the possible damage criteria thresholds. In addition, all off-site structures are located more than 25 feet from proposed project travel ways. Therefore, project operation vibration levels would not exceed groundborne noise or groundborne vibration thresholds presented above. Impacts associated with operational vibration would be considered less than significant.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Less than significant impact.

5.4 - CEQA (Appendix G) Thresholds Applicable to Airport Noise Impacts

The CEQA Guidelines state that the project may result in a significant noise impact if it would expose people residing or working in the project area to excessive aircraft noise levels (for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airstrip); or, for a project within the vicinity of a private airstrip, if it would expose people residing or working in the project area to excessive aircraft noise levels.

There are no airports, private or public within two miles of the project site. The nearest airport is Banning Airport, which is, located over 9 miles southeast of the site. The project would not expose people residing or working in the area to excessive aircraft noise levels.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Less than significant impact.

SECTION 6: RESIDENTIAL ALTERNATIVE IMPACT ANALYSIS AND MITIGATION

6.1 - Construction Noise Impacts

Project-related construction noise levels were calculated for the residential alternative using the RCNM provided by the FHWA. The modeled scenario assumed the simultaneous use of some of the loudest types of heavy construction equipment, including two graders, one dozer, and one scraper at reasonably expected distance from each other. A 40 percent usage factor was assumed for each piece of equipment. Table 14 summarizes the construction noise modeling results at the closest sensitive receptors to the project site. Modeling output and modeling parameters are provided in Appendix C.

With implementation of the residential alternative, high density residential development would occur in the western portion of the project site, while medium density residential development would occur in the central portion, and very low density residential would occur in the northern portion of the project site. A riparian landscape would provide a setback from Cherry Valley Boulevard along the southern boundary of the project site.

Table 14: Comparison of Existing Ambient and Construction Noise Levels

Sensitive Receptor[1]	Location - Distance/Direction from Site	Ambient Noise Level dBA L_{max}/L_{eq}	Construction Noise Level dBA L_{max}/L_{eq}	Temporary Increase due to Construction Noise dBA L_{max}/L_{eq}
East end of Mobile Home Ranch	City of Calimesa - 1500 feet northwest of nearest construction footprint	56/52$^{(NM1)}$	50[2]/50	0/0
Single family home	City of Calimesa - 850 feet west of nearest construction footprint	84/68$^{(NM2)}$	63/63	0/0
Single family home	County of Riverside - 1200 feet north of nearest construction footprint	52/46$^{(NM3)}$	74/73	22/27
Single family home	County of Riverside - 1600 feet north of nearest construction footprint	52/46$^{(NM3)}$	68/67	16/21
Single family home	City of Calimesa - 670 feet west of nearest construction footprint	55/51$^{(NM4)}$	80/79	25/28
Single family homes	County of Riverside - 110 feet to southeast of nearest project driveway construction area	85/69$^{(NM5)}$	78/77	0/8

Table 14 (cont.): Comparison of Existing Ambient and Construction Noise Levels

Sensitive Receptor[1]	Location - Distance/Direction from Site	Ambient Noise Level dBA L_{max}/L_{eq}	Construction Noise Level dBA L_{max}/L_{eq}	Temporary Increase due to Construction Noise dBA L_{max}/L_{eq}
Notes: [1] Sensitive Receptor locations are shown in Exhibit 2. [2] An extra 10 dB was deducted due to intervening topography. NM = Noise Measurement Location				

As noted previously, the City of Calimesa has established noise level limits for construction activities at receiving land uses of 75 dBA L_{eq} (8-hour). As shown in Table 14, construction noise levels at off-site sensitive receptors could range up to levels above those that would be experienced under implementation of the warehouse alternative. This is primarily due to that fact that construction of proposed residential structures could occur closer to off-site sensitive receptors than the proposed construction footprint of the warehouse structures. Such noise levels would be expected to be shorter in duration as the time required to do site preparation for a single family home is substantially less than that required for construction of the proposed warehouse buildings. Therefore, overall construction impacts would be similar to those experienced under implementation of the warehouse alternative. However, construction noise levels at the nearest off-site residence in Calimesa, west of the project site, would experience noise levels in excess of the City's standard. Therefore, additional mitigation shall be implemented that would require installation of minimum 6-foot high temporary sound barriers along the project property line so as to block the line of sight from nearby residential land uses to the construction activity footprint, for any construction activity that would require use of heavy construction equipment within 800 feet of any residential structure within the City limits of Calimesa. These temporary sound barriers would reduce construction noise levels by a minimum of 5 dBA as measured at nearby sensitive receptors. This would effectively reduce worst-case construction noise levels shown in Table 14 to below the City's threshold of 75 dBA L_{eq}, which would reduce this impact to less than significant.

As shown in Table 14, construction activities with the residential alternative could result in substantial temporary increases of up to 25 dBA L_{max} and 28 dBA L_{eq} in ambient noise levels at sensitive receptors in the project vicinity. In particular, substantial temporary noise increases would be expected at four out of the six residences located nearest the project site when multiple pieces of heavy construction equipment operate simultaneously at the nearest project construction limits. To reduce this potential impacts, the mitigation measure NOI-1a through 1e, and NOI-2 would be implemented.

Level of Significance Before Mitigation

Potentially significant impact due to temporary substantial increase in noise levels.

Mitigation Measures

Implement MM NOI-1a through NOI-1e.

MM NOI-2 For any construction activity that would require use of heavy construction equipment within 800 feet of any residential structure within the City limits of Calimesa must place temporary sound barriers that are a minimum of 6 feet high along the project property line so as to block the line of sight from such nearby residential land uses to the construction activity footprint. These temporary sound barriers would reduce construction noise levels by a minimum of 5 dBA as measured at nearby sensitive receptors. This would effectively reduce worst-case construction noise levels shown in Table 14 to below the City's threshold of 75 dBA L_{eq}

Level of Significance After Mitigation

Less than significant impact. Implementation of multi-part MM NOI1a through NOI-1e and MM NOI-2 would ensure compliance of construction noise impacts associated with the residential alternative with the City's and County's construction noise ordinances, as well as would further reduce potential noise impacts, to the extent feasible, that could cause discomfort or annoyance for a reasonable person residing or working in the immediate project vicinity.

6.2 - Operational Noise Impacts

6.2.1 - Traffic Noise Impacts

A significant impact would occur if the residential alternative would be exposed to noise levels of the City's "normally compatible" standard of 60 dBA CNEL for new residential land use development, or if the alternative would result in a substantial increase in traffic noise levels compared to noise levels existing without the alternative. The Environmental Impact Report prepared for the County of Riverside General Plan utilizes "an increase in long-term ambient noise by 5 dBA or more" to determine if the project would result in a substantial increase in long-term ambient noise levels.

The FHWA highway traffic noise prediction model (FHWA RD-77-108) was again used to evaluate traffic-related noise conditions in the vicinity of the Project site that would result with implementation of the residential alternative. Traffic data used in the model was obtained from the traffic impact analysis prepared by Urban Crossroads (2014). The resultant noise levels were weighed and summed over a 24-hour period in order to determine the CNEL values. The modeled average daily traffic (ADT) volumes were obtained by multiplying the PM peak hour intersection traffic volumes by a factor of ten. As a worst-case analysis, future roadway widening that is would occur with implementation of the project was assumed for both without project and with project future conditions. The traffic noise modeling input and output files are included in Appendix A of this report. Table 15, Table 16, and Table 17 summarize the traffic noise modeling results for existing, cumulative (year 2017), and horizon (year 2035) traffic conditions, without and with the residential alternative.

The highest traffic noise levels on segments of Cherry Valley Boulevard adjacent to the project site would occur under horizon (year 2035) traffic conditions with implementation of the residential alternative. Based on the traffic noise modeling results shown in Table 17, the Project site would be exposed to traffic noise levels ranging up to approximately 73.9 dBA CNEL at 50 feet from the centerline of the nearest travel lane of Cherry Valley Boulevard, under horizon (year 2035) plus

residential alternative traffic conditions. At the nearest proposed residential property line, located approximately 200 feet from the centerline of Cherry Valley Boulevard (due to the proposed landscape buffer and riparian landscape setback), these traffic noise levels would attenuate to approximately 64 dBA CNEL.

Table 15: Existing without- and with-Residential Alternative Modeled Roadway Noise Levels

Source: FirstCarbon Solutions 2014.

According to the County's land use compatibility guidelines, environments with noise levels from 55 dBA up to 70 dBA CNEL are considered "conditionally acceptable" for new residential land use development. In such cases, new construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, with closed windows and fresh air supply systems or air conditioning will normally suffice. Therefore, all proposed residences located within 350 feet of the centerline of Cherry Valley Boulevard must include a fresh air supply system or air conditioning that will permit windows to remain closed for prolonged periods of time.

Modeling results also show that project generated vehicle noise on area-wide roadways would result in a maximum increase of up to 3.6 dBA in traffic noise levels with implementation of the residential alternative compared to traffic noise levels existing without the project. This highest increase would occur under existing plus residential alternative traffic conditions along the segment of Union Street south of Cherry Valley Boulevard. The County of Riverside considers a permanent increase of 5 dBA or greater to be a substantial increase. Therefore, an increase in 3.6 dBA is not considered substantial, and residential alternative generated traffic noise would result in a less than significant impact on off-site sensitive receptors along area-wide roadways.

It should be noted that two roadway segments under Existing plus residential alternative conditions (as shown in Table 15) would experience an apparent decrease in traffic noise levels as measured at

50 feet from the centerline of the outermost travel lane. However, this apparent reduction only occurs because the existing plus residential alternative conditions assume the improvement of the portion of Cherry Valley Boulevard that is adjacent to the project site to a four lane roadway. This improvement essentially moves traffic further away from the outermost travel lane, thus "reducing" the traffic noise levels as measured at that distance. However, this reduction would not be distinguishable compared to existing conditions and should therefore be assumed to be equivalent to no increase.

Implementation of this alternative would result in overall slightly higher traffic noise levels than those that would be experienced under the proposed Project. For example, traffic noise levels under existing plus residential alternative conditions would range up to 55.3 dBA CNEL, an increase of up to 3.6 dBA along Union Street south of Cherry Valley Boulevard with implementation of the residential alternative. However, under the proposed Project, traffic noise levels along this segment under existing plus Project conditions would range up to 52.9 dBA CNEL, representing an increase of 1.2 dBA over conditions existing without the project. Therefore, traffic noise impacts associated with implementation of the residential alternative would be slightly higher than those that would be experienced with implementation of the proposed Project.

Level of Significance Before Mitigation

Potentially significant impact due to traffic noise levels with the residential alternative exceeding normally acceptable standards for new residential land use development.

Mitigation Measures

MM NOI-3 All residential units constructed within 350 feet of the centerline of Cherry Valley Boulevard must include a fresh air supply system or air conditioning that will permit windows to remain closed for prolonged periods of time. Standard residential construction with windows closed provides a minimum of 25 dBA in exterior to interior noise reduction, effectively reducing traffic noise levels to meet the interior noise level standard of 45 dBA CNEL.

Level of Significance After Mitigation

Less than significant impact.

6.2.2 - Stationary Noise Impacts

A brief discussion of the types of noise that can be expected to occur with implementation of the residential alternative is presented below.

Heating, Ventilating, and Air Conditioning Equipment Noise

The primary stationary noise source associated with new residential development is noise associated with heating, ventilating, and air conditioning (HVAC) equipment. Although no final design is available at this time for the type and location of outdoor mechanical ventilation units, typical reference noise levels for new residential mechanical ventilation systems (including air conditioning units) range from 50 dBA to 65 dBA L_{eq} at 10 feet. The closest sensitive receptor is the residence to the west of the project site located approximately 30 feet from the nearest project boundary and an

estimated 80 feet from the nearest possible location for new mechanical ventilation units. At this distance operational noise levels of the new mechanical ventilation systems would attenuate to below 47 dBA L_{eq}. This is below the existing measured ambient noise level in the vicinity of this receptor. These noise levels are also below both the daytime and nighttime operational noise standards of the City of Calimesa.

Similarly, new residential mechanical ventilation systems operational noise levels would result in noise levels below the County of Riversides daytime and nighttime operational noise standards. The closest receptor within the Count of Riverside is the residence to the north of the project site located approximately 135 feet from the nearest residential development project boundary and an estimated 185 feet from the nearest possible location for new residential mechanical ventilation systems. At this distance operational noise levels of the proposed HVAC units would attenuate to below 40 dBA L_{eq}. This is also below the existing measured ambient noise level in the vicinity of these nearest receptors.

Noise from operation of new mechanical ventilation systems associated with implementation of the residential alternative would not violate the operational noise standards of the County of Riverside Code or the City of Calimesa Municipal Ordinance, nor result in a substantial increase in ambient noise levels. Therefore, stationary noise source impacts associated with implementation of the residential alternative would result in a less than significant impact.

Noise levels from mechanical ventilation equipment would be slightly higher at off-site receptors under the residential alternative conditions compared to those under the proposed Project. This is primarily due to the assumption that mechanical equipment associated with the residential alternative would be located closer to the project borders than the rooftop mechanical equipment of the proposed Project. However, overall stationary noise levels of the proposed Project, including noise levels from parking lot noise and truck loading and unloading operations (ranging up to 58 dBA L_{eq} at the closest off-site receptor) would be higher than the overall stationary noise levels of the residential alternative (ranging up to 47 dBA L_{eq}).

6.3 - Groundborne Vibration Impacts

The County of Riverside, the City of Calimesa and the State of California have not adopted criteria or regulations for groundborne vibration or groundborne noise. Therefore, for purposes of this analysis, the annoyance and damage impact criteria of the FTA are utilized.

Implementation of the residential alternative would not result in any new permanent sources of groundborne vibration. In addition, there are no significant sources of existing groundborne vibration to which new sensitive residential development would be exposed. The only potential groundborne vibration impacts that could result from implementation of the residential alternative would be temporary impacts associated with operation of heavy construction equipment during the site preparation phase of construction.

Table 2 shows the PPV of common construction equipment and haul trucks (loaded trucks). The most vibration-causing piece of equipment that will likely be used on-site is the vibratory roller. This machine can produce groundborne vibration levels of up to 0.21 PPV at 25 feet. The closest off-site sensitive

receptor is located approximately 30 feet from the nearest project boundary and approximately 80 feet from the nearest project construction footprints where potential operation of such heavy construction equipment could occur. At this distance, groundborne vibration levels would attenuate to below 0.037 PPV, well below the potential damage criteria threshold for even the most sensitive type of structures. Therefore, implementation of the residential alternative would be expected to result in less than significant groundborne vibration impacts.

Overall construction vibration impacts for the residential alternative would be similar to those that would be experienced under the proposed Project as heavy construction equipment would operate along the project borders under both scenarios. However, operational vibration impacts of the residential alternative would be slightly lower than the proposed Project as it would not include the daily operation of large trucks passing on local roadways. However, as is shown in impact discussion section 5.3.2, all operational vibration impacts of the Project are found to be less than significant and no mitigation is required.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Less than significant impact.

6.4 - CEQA (Appendix G) Thresholds Applicable to Airport Noise Impacts

As previously discussed under the proposed warehouse alternative impact analysis, the CEQA Guidelines state that the project may result in a significant noise impact if it would expose people residing or working in the project area to excessive aircraft noise levels (for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airstrip). An impact would also occur if, for a project within the vicinity of a private airstrip, it would expose people residing or working in the project area to excessive aircraft noise levels.

There are no airports, private or public within two miles of the project site. The nearest airport is Banning Airport, which is, located over 9 miles southeast of the site. The project would not expose people residing or working in the area to excessive aircraft noise levels.

While implementation of the residential alternative has the potential to introduce new sensitive receptors to existing aircraft noise levels (in contrast to the proposed Project), the fact that the nearest airport is located over 9 miles southeast of the project site reduces this potential impact to less than significant and no mitigation would be required.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Less than significant impact.

Construction Noise Modeling Sheets

THIS PAGE INTENTIONALLY LEFT BLANK

Roadway Construction Noise Model (RCNM),Version 1.1

Report date:	12/15/2014															
Case Description:	San Gorgonio Crossing - Warehouse Alt															
				---- Receptor #1 ----												
		Baselines (dBA)														
Description	Land Use	Daytime	Evening	Night												
Calimesa Mobile Homes	Residential	55.5	55	45												
				Equipment												
				Spec	Actual	Receptor	Estimated									
		Impact		Lmax	Lmax	Distance	Shielding									
Description		Device	Usage(%)	(dBA)	(dBA)	(feet)	(dBA)									
Grader		No	40	85		1500	10									
Grader		No	40	85		1550	10									
Dozer		No	40	85		1550	10									
Scraper		No	40	85		1600	10									
				Results												
		Calculated (dBA)			Noise Limits (dBA)						Noise Limit Exceedance (dBA)					
				Day		Evening		Night		Day		Evening		Night		
Equipment		*Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	
Grader		45.5	41.5	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
Grader		45.2	41.2	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
Dozer		45.2	41.2	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
Scraper		44.9	40.9	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
	Total	45.5	47.2	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
		*Calculated Lmax is the Loudest value.														

				---- Receptor #2 ----											
		Baselines (dBA)													
Description	Land Use	Daytime	Evening	Night											
Single Family Residence	Residential	55	55	45											
				Equipment											
				Spec	Actual	Receptor	Estimated								
		Impact		Lmax	Lmax	Distance	Shielding								
Description		Device	Usage(%)	(dBA)	(dBA)	(feet)	(dBA)								
Grader		No	40	85		850	0								
Grader		No	40	85		900	0								
Dozer		No	40	85		900	0								
Scraper		No	40	85		950	0								
				Results											
		Calculated (dBA)			Noise Limits (dBA)						Noise Limit Exceedance (dBA)				
				Day		Evening		Night		Day		Evening		Night	
Equipment		*Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq	Lmax	Leq
Grader		60.4	56.4	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Grader		59.9	55.9	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Dozer		59.9	55.9	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Scraper		59.4	55.4	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
	Total	60.4	62	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
		*Calculated Lmax is the Loudest value.													

				---- Receptor #3 ----											
		Baselines (dBA)													
Description	Land Use	Daytime	Evening	Night											
Single Family Residence	Residential	55	55	45											
				Equipment											
				Spec	Actual	Receptor	Estimated

1 INTRODUCTION

This report presents the results of the traffic impact analysis (TIA) for the proposed San Gorgonio Crossing (Parcel Map No. 36093) ("Project"), which is generally located north of Cherry Valley Boulevard and approximately 1,800 feet east of the I-10 Freeway and Cherry Valley Boulevard interchange in unincorporated County of Riverside.

The purpose of this traffic impact analysis is to evaluate the potential impacts to traffic and circulation associated with the development of the proposed Project, and recommend improvements necessary to mitigate impacts considered significant in comparison to established regulatory thresholds. As directed by County of Riverside staff, this TIA has been prepared in accordance with the Riverside County Transportation Department's *Traffic Impact Analysis Preparation Guide* (April 2008). (1) The approved Project Traffic Study Scoping agreement is provided in Appendix "1.1" of this TIA.

1.1 PROJECT OVERVIEW

The Project includes the development of approximately 1,860,760 square feet of high-cube distribution warehouse use between two (2) buildings. For the purposes of this traffic study, the square footage of the buildings is listed below:

- Building 1 – 737,480 square feet of high-cube distribution warehouse use with access to Cherry Valley Boulevard via Driveway 1 and Street 2.
- Building 2 – 1,123,280 square feet of high-cube distribution warehouse use with access to Cherry Valley Boulevard via Street 2 and Driveway 3.

The site plan for the proposed Project is shown on Exhibit 1-1. Exhibit 1-2 depicts the location of the proposed project in relation to the existing roadway network. It is anticipated that the Project will be developed as a single phase. The Project's opening year is anticipated to be 2017 (i.e., fully built and occupied). Access to the Project site will be provided via Driveway 1, Street 2 and Driveway 3 to Cherry Valley Boulevard. Right-in/right-out access only is proposed at Driveway 1 and Driveway 3, with full access at Street 2.

Trips generated by the Project's proposed land uses (1,860,760 square feet of high-cube warehouse use) have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) Trip Generation Manual, 9th Edition, 2012. (2) To represent the impact large trucks, buses and recreational vehicles have on traffic flow; all trucks were converted into Passenger Car Equivalents (PCEs). By their size alone, these vehicles occupy the same space as two or more passenger cars. In addition, the time it takes for them to accelerate and decelerate is greater than for passenger cars, and varies depending on the type of vehicle and number of axles. For the purpose of this analysis, a PCE factor of 1.5 has been applied to 2-axle trucks, 2.0 for 3-axle trucks and 3.0 for 4+-axle trucks.

The Project is estimated to generate a net total of approximately 3,126 net trip-ends per day (4,905 net passenger car equivalent (PCE) trip-ends per day) on a typical weekday with approximately 205 (288 PCE) net AM peak hour trips and 223 (335 PCE) net PM peak hour trips.

EXHIBIT 1-1: PRELIMINARY SITE PLAN

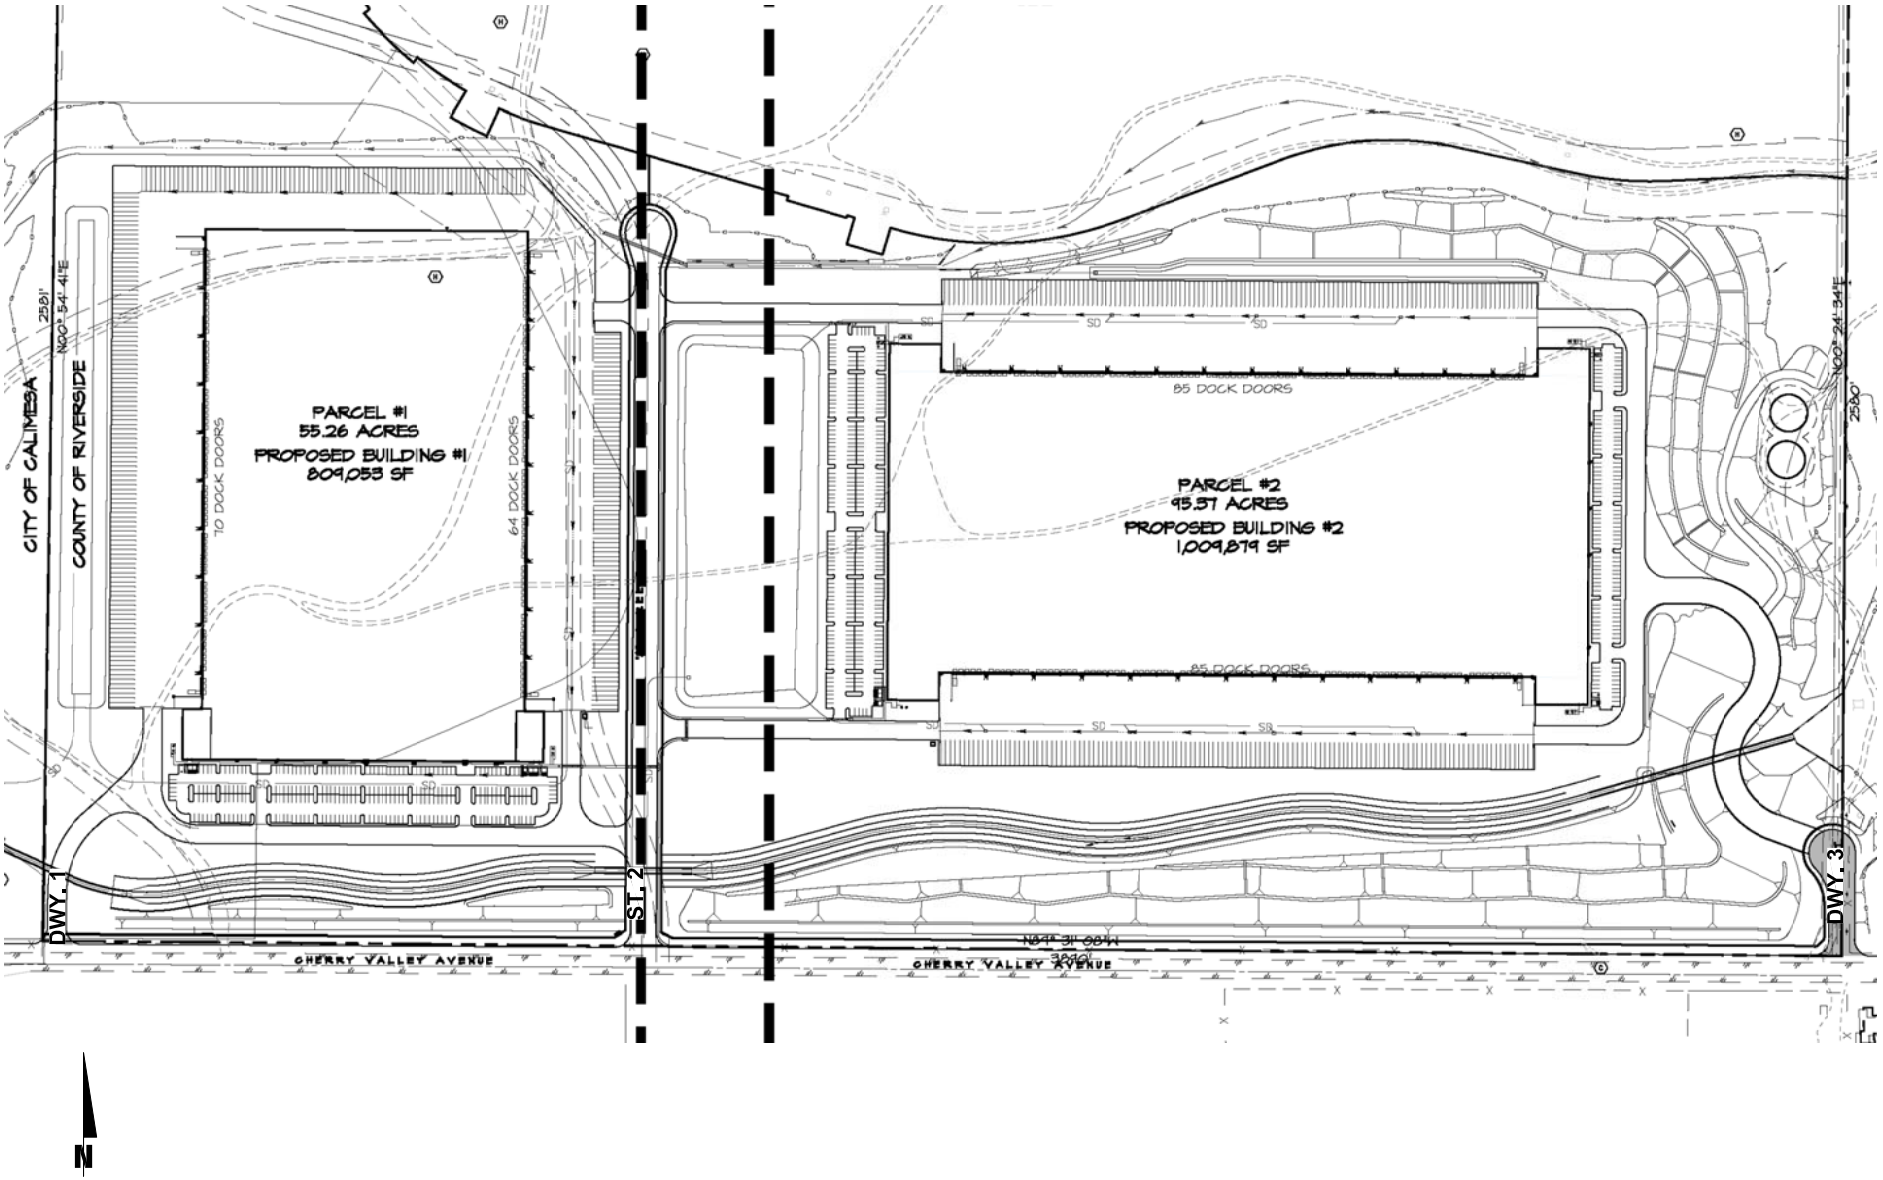

EXHIBIT 1-2: LOCATION MAP

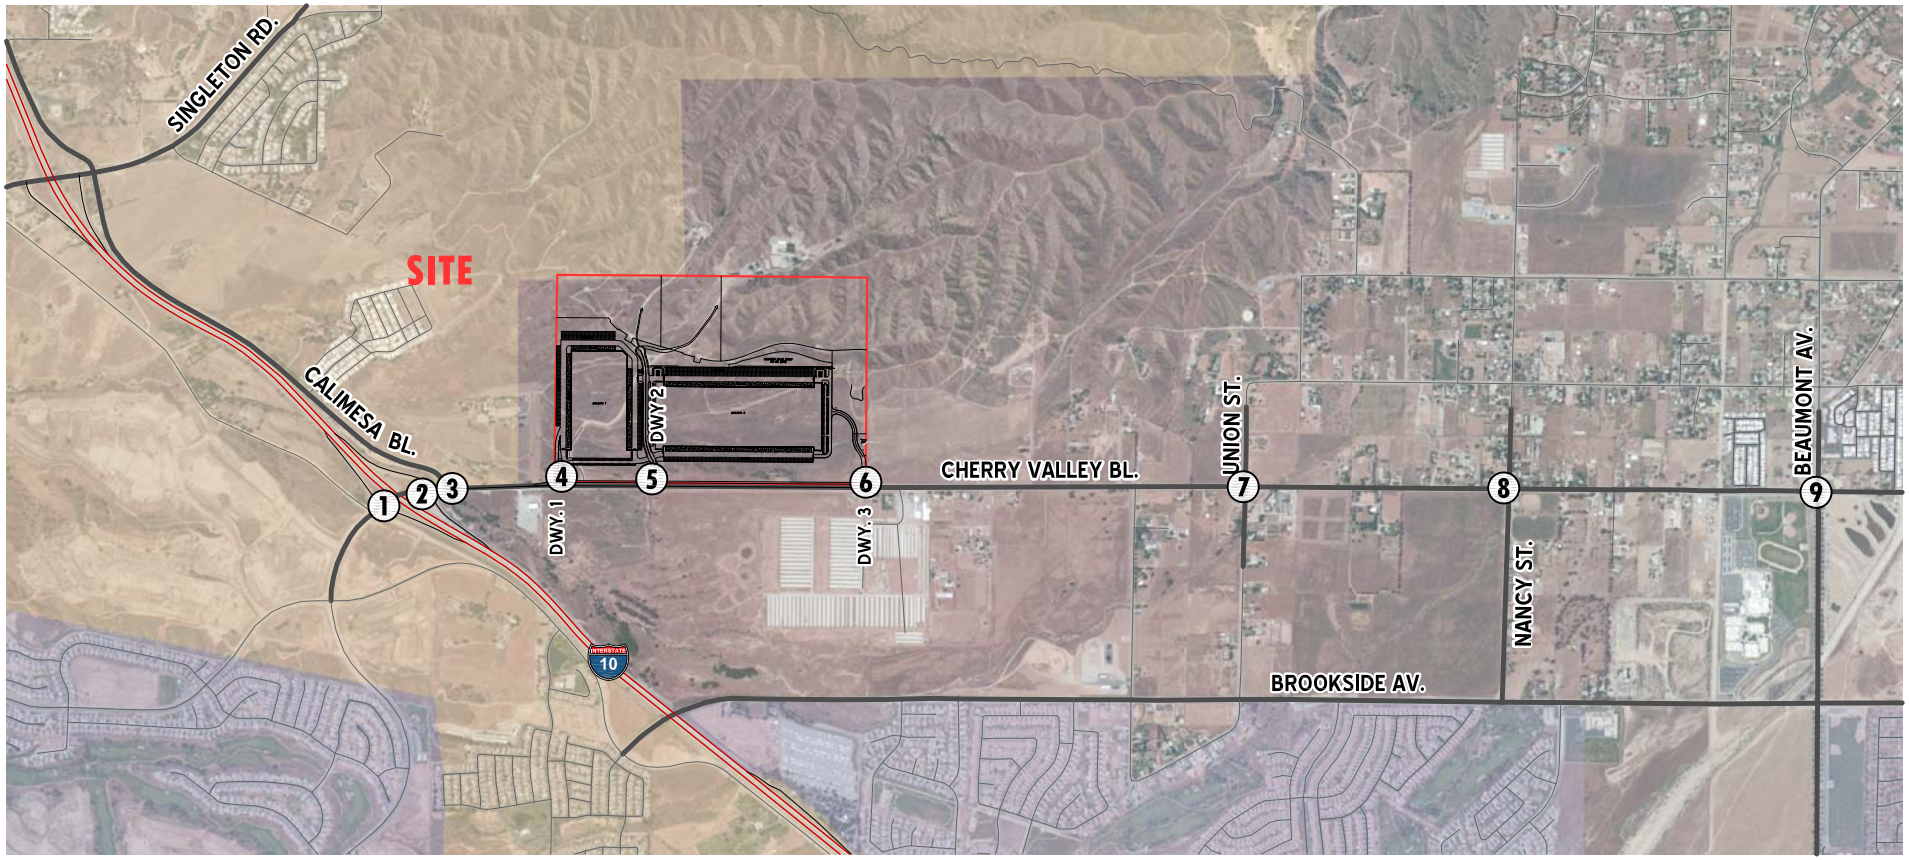

LEGEND:

① = INTERSECTION ANALYSIS LOCATION

The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 Project Trip Generation of this report.

1.2 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential impacts to traffic and circulation have been assessed for each of the following conditions:

- Existing (2014) Conditions
- Existing plus Project Conditions
- Existing plus Ambient Growth plus Project (EAP) (2017) Conditions
- Existing plus Ambient Growth plus Project plus Cumulative (EAPC) (2017) Conditions
- Horizon Year (2035) Without Project Conditions
- Horizon Year (2035) With Project Conditions

1.2.1 EXISTING (2014) CONDITIONS

Information for Existing (2014) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared.

1.2.2 EXISTING PLUS PROJECT CONDITIONS

The Existing plus Project (E+P) analysis determines significant traffic impacts that would occur on the existing roadway system in the theoretical scenario of the Project being placed upon Existing conditions. The E+P scenario is presented for informational purposes only as the County of Riverside's currently adopted traffic study guidelines requires Project impacts to be identified through the analysis of EAP traffic conditions.

1.2.3 EXISTING PLUS AMBIENT GROWTH PLUS PROJECT (2017) CONDITIONS

The EAP (2017) conditions analysis determines the traffic impacts based on a comparison of the EAP traffic conditions to Existing (2014) conditions. To account for background traffic growth, an ambient growth factor from Existing (2014) conditions of 6.12% (2 percent per year over 3 years, compounded annually) is included for EAP (2017) traffic conditions. Cumulative development projects are not included as part of the EAP (2017) analysis. Consistent with Riverside County traffic study guidelines, the EAP (2017) analysis is intended to identify opening year impacts associated with the development of the proposed Project based on the expected background growth within the study area.

1.2.4 EXISTING PLUS AMBIENT GROWTH PLUS PROJECT PLUS CUMULATIVE (2017) CONDITIONS

The EAPC (2017) conditions analysis determines if near-term cumulative traffic conditions can be served by improvements funded through regional transportation mitigation fee programs, such as the Transportation Uniform Mitigation Fee (TUMF) and County of Riverside Development Impact Fee (DIF), or other approved funding mechanism. If the "funded" improvements can provide the requisite LOS, then the Project's payment into one or more of the pre-existing fee programs shall be considered as adequate mitigation to address the Project's contribution to cumulative traffic impacts. To account for Opening Year conditions,

other known development projects assumed to interact or contribute traffic to study area intersections were included in addition to 6.12% of ambient growth for EAPC (2017) traffic conditions.

1.2.5 HORIZON YEAR (2035) CONDITIONS

Traffic projections for Horizon Year (2035) with Project conditions were derived from the County of Riverside Traffic Analysis Model (RivTAM) using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between Existing (2014) conditions and Horizon Year (2035) conditions including foreseeable past, present and future development proposals. The Horizon Year (2035) conditions analysis has also been utilized to determine if improvements funded through local and regional transportation mitigation fee programs such as the Transportation Uniform Mitigation Fee (TUMF) program and County Development Impact Fee (DIF) programs can accommodate the cumulative traffic at the target LOS identified in the County of Riverside General Plan. If the "funded" improvements can provide the target LOS, then the Project's payment into the established fee programs will be considered as cumulative mitigation through the conditions of approval. Other improvements needed beyond the "funded" improvements (such as localized improvements to non-TUMF, non-DIF facilities) are identified as such

1.3 STUDY AREA

The potential impact study area was defined in coordination with the County of Riverside staff and in conformance with the requirements of the County's TIA preparation guidelines. Based on these guidelines, the minimum area to be studied shall include any intersection of "Collector" or higher classification streets, at which the proposed project will add 50 or more peak hour trips. Exhibit 1-2 presents the study area roadway network, intersection analysis locations, and freeway mainline segments.

To ensure that this TIA complies with the County's TIA preparation guidelines, Urban Crossroads, Inc. prepared a Project Traffic Study Scoping Agreement for review by County staff prior to the preparation of this TIA. The Agreement provides an outline of the Project study area, trip generation, trip distribution, and analysis methodology. The County staff reviewed the Agreement and accepted the TIA's proposed study area and methodology as meeting the County's TIA preparation guidelines. The Agreement approved by the County of Riverside is included in Appendix "1.1".

1.3.1 INTERSECTIONS

The following nine study area intersection locations shown on Exhibit 1-2 and listed on Table 1-1 were selected for this TIA based on the County of Riverside's traffic study guidelines that require analysis of intersection locations in which a proposed project is anticipated to contribute 50 or more peak-hour trips.

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction
1	I-10 Freeway EB Ramps / Cherry Valley Boulevard	Caltrans
2	I-10 Freeway WB Ramps / Cherry Valley Boulevard	Caltrans
3	Calimesa Boulevard / Cherry Valley Boulevard	RivCo, Calimesa
4	Driveway 1 / Cherry Valley Bl.- Future Intersection (RIRO)	Riverside County
5	Street 2 / Cherry Valley Boulevard - Future Intersection	Riverside County
6	Driveway 3 / Cherry Valley Bl. - Future Intersection (RIRO)	Riverside County
7	Union St. / Cherry Valley Boulevard	Riverside County
8	Nancy Av. / Cherry Valley Boulevard	Riverside County
9	Beaumont Av. / Cherry Valley Boulevard	Riverside County

It should be noted that the "50 peak hour trip" criterion utilized by the County of Riverside and the City of Calimesa is consistent with the methodology employed by other jurisdictions throughout Southern California, and generally represents a threshold of trips at which an intersection would have the potential to be significantly impacted. Although each intersection may have unique operating characteristics, this traffic engineering rule of thumb is a widely utilized tool for estimating a potential area of impact (i.e., study area).

1.3.2 FREEWAY MAINLINE SEGMENTS

Consistent with Caltrans traffic study guidelines, the freeway mainline analysis locations include the segments on either side of the interchange where the proposed Project is anticipated to contribute 100 two-way peak hour trips on the segments. The study area freeway mainline analysis locations include four I-10 Freeway mainline segments on either side of Cherry Valley Boulevard for both eastbound and westbound directions of flow as shown on Table 1-2:

TABLE 1-2 FREEWAY MAINLINE SEGMENT ANALYSIS LOCATIONS

ID	Freeway Mainline Segments
1	I-10 Freeway – Eastbound, east of Cherry Valley Boulevard
2	I-10 Freeway – Eastbound, west of Cherry Valley Boulevard
3	I-10 Freeway – Westbound, east of Cherry Valley Boulevard
4	I-10 Freeway – Westbound, west of Cherry Valley Boulevard

Pursuant to recent clarification from Caltrans, study area mainline segments on which the Project's contribution of 50 or more peak hour trips on a segment, which is a wider study area than the I-10 segments east and west of Cherry Valley Boulevard were studied and is presented as a supplement to this report in a letter titled *San Gorgonio Crossing Traffic Impact Analysis – Supplemental Expanded Freeway Segment Analysis* .

1.3.3 FREEWAY MERGE/DIVERGE RAMP JUNCTIONS

The study area freeway merge/diverge ramp junction analysis locations include four I-10 Freeway ramp junctions at Cherry Valley Boulevard for both eastbound and westbound directions of flow as shown on Table 1-3:

TABLE 1-3 FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS LOCATIONS

ID	Freeway Merge/Diverge Ramp Junctions
1	I-10 Freeway – Eastbound, Off-Ramp at Cherry Valley Boulevard (Diverge)
2	I-10 Freeway – Eastbound, On-Ramp at Cherry Valley Boulevard (Merge)
3	I-10 Freeway – Westbound, On-Ramp at Cherry Valley Boulevard (Merge)
4	I-10 Freeway – Westbound, Off-Ramp at Cherry Valley Boulevard (Diverge)

1.4 ANALYSIS FINDINGS

This section provides a summary of the analysis results for Existing (2014), E+P, EAP, EAPC, and Horizon Year traffic conditions. Section 2.0 *Methodologies* provides information on the methodologies used in the analysis.

1.4.1 INTERSECTIONS

A summary of intersection level of service (LOS) findings by traffic condition is provided on Table 1-4.

EXISTING (2014) CONDITIONS

For Existing traffic conditions, the following intersections were found to operate at an unacceptable LOS during either the AM and/or PM peak hours:

ID	Intersection Location	Jurisdiction
1	I-10 EB Ramps / Cherry Valley Boulevard	Caltrans
2	I-10 WB Ramps / Cherry Valley Boulevard	Caltrans

Table 1-4

Summary of Intersection LOS

#	Intersection	Existing (2014) LOS		E+P LOS		EAP LOS		EAPC LOS		2035 NP LOS		2035 WP LOS		Acceptable LOS
		AM	PM	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM	
1	I-10 EB Ramps / Cherry Valley Bl.	C	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	D
2	I-10 WB Ramps / Cherry Valley Bl.	**F**	D	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	**F**	D
3	Calimesa Boulevard / Cherry Valley Bl.	B	B	C	C	C	C	**F**	**F**	**F**	**F**	**F**	**F**	C
4	Driveway 1 / Cherry Valley Bl.	--	--	B	B	B	B	C	B	--	--	C	C	D
5	Street 2 / Cherry Valley Bl.	--	--	B	A	B	A	C	B	--	--	--	--	D
6	Driveway 3 / Cherry Valley Bl.	--	--	B	A	B	A	B	B	--	--	B	C	D
7	Union St. (NS) / Cherry Valley Bl.	C	B	C	B	C	C	D	C	**F**	**F**	**F**	**F**	D
8	Nancy Av. (NS) / Cherry Valley Bl.	B	B	B	B	B	B	C	B	**F**	**F**	**F**	**F**	D
9	Beaumont Ave. / Cherry Valley Bl.	C	B	C	B	C	B	D	C	**F**	**F**	**F**	**F**	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

LOS = Level of Service; E+P = Existing Plus Project; EAP = Existing Plus Ambient Growth Plus Project; EAPC = Existing Plus Ambient Growth Plus Project Plus Cumulativ

NP = No Project (or Without Project); WP = With Project

EXISTING PLUS PROJECT CONDITIONS

The same intersections that were found to operate at a deficient LOS (i.e. LOS E or F) under Existing traffic conditions were also found to operate at a deficient LOS under E+P traffic conditions. In other words, there were no NEW deficiencies identified due to the addition of Project traffic.

EXISTING PLUS AMBIENT GROWTH PLUS PROJECT (2017) CONDITIONS

Based on a comparison of EAP to Existing and E+P traffic conditions, the same intersections previously identified to operate at an unacceptable LOS for Existing and E+P traffic conditions were also found to operate at an unacceptable LOS for EAP traffic conditions. In other words, there were no NEW deficiencies identified due to the addition of 6.12% ambient growth along with Project traffic.

EXISTING PLUS AMBIENT GROWTH PLUS PROJECT PLUS CUMULATIVE (2017) CONDITIONS

Based on the assessment of EAPC traffic conditions, the following additional intersections were identified to operate at a deficient LOS in addition to those previously identified under Existing traffic conditions:

ID	Intersection Location	Jurisdiction
3	Calimesa Boulevard / Cherry Valley Boulevard	RivCo, Calimesa

HORIZON YEAR (2035) CONDITIONS

Based on the assessment of Horizon Year Without and With Project traffic conditions, the following additional intersections were identified to operate at a deficient LOS in addition to those previously identified under Existing, E+P, EAP, and EAPC traffic conditions:

ID	Intersection Location	Jurisdiction
5	Street 2 / Cherry Valley Boulevard	Riverside County
7	Union St. / Cherry Valley Boulevard	Riverside County
8	Nancy Av. / Cherry Valley Boulevard	Riverside County
9	Beaumont Av. / Cherry Valley Boulevard	Riverside County

1.4.2 FREEWAY MAINLINE

The analysis of Freeway operations prepared for this traffic study concludes that mainline and ramp junctions of the I-10 Freeway east and west of Cherry Valley Boulevard would operate at LOS "D" or better under Existing (2014), E+P, EAP (2017) and EAPC (2017) traffic conditions. However, the freeway segments and ramp junctions were found to be cumulatively impacted under Horizon Year (2035) without and with Project traffic conditions.

The mainline and ramp junctions of the I-10 Freeway east and west of Cherry Valley Boulevard would operate at LOS "F" even without the Project under Horizon Year (2035) traffic conditions. In fact, the Project's contribution to cumulative impacts under Horizon Year (2035) conditions involves only a small percentage (approximately 1% or less) of the forecasted traffic occurring on the identified freeway mainline and ramp junction under 2035 conditions.

1.4.3 FREEWAY OFF-RAMP QUEUING

There are no potential queuing issues anticipated during the AM and PM peak 95th percentile traffic flows for EAP (2017), EAPC (2017) traffic conditions and Horizon Year (2035) with Project traffic conditions.

1.5 RECOMMENDED IMPROVEMENTS

1.5.1 INTERSECTIONS

Table 1-5 lists the recommended improvements necessary to reduce the identified intersection LOS deficiencies by traffic condition. In addition, Table 1-5 also indicates those improvements currently included in existing fee programs. The Project's "fair share" percentage has also been calculated for each deficient study intersection.

A preliminary roundabout alternative to signalization at the I-10 Freeway at Cherry Valley Boulevard interchange ramps has been assessed and discussed later in this report. The preliminary roundabout alternative assessment has been based on near term and 2035 concepts previously presented in the *Roundabout Feasibility Study for Interstate 10 and Cherry Valley Boulevard Interchange* published by Omni-means, Ltd. (September 2013). (3)

1.5.2 FREEWAY MAINLINE

The Riverside County Transportation Commission (RCTC) shows long range plans to add an eastbound truck climbing lane from the San Bernardino County line to SR-60. The Caltrans I-10 Route Concept Report, which is currently being updated, shows plans for adding an HOV lane from San Bernardino County Line to SR-60. As the timing and funding of these future improvements are uncertain, they were not included as part of this analysis.

At this time, Caltrans has no fee programs or other mitigation programs in place for the mitigation of direct or cumulative impacts caused by development projects in Riverside County on State Highway System (SHS) roadway segments. Mitigation of cumulative impacts to freeway ramps are satisfied by mandatory participation in the TUMF program.

1.5.3 MITIGATION MEASURES

While ultimate improvement plans have not yet been finalized for the I-10 interchange at Cherry Valley Boulevard, a roundabout concept is being proposed by the City of Calimesa. As timing of future improvements to the interchange are uncertain, the project applicant proposes, and Mitigation Measures 1A and 1B require, payment of the project's fair share toward the construction of the interchange improvements or, if a fair share contribution program has not been established, construction of interim improvements at the I-10 at Cherry

Table 1-5

Summary of Intersection Improvements

#	Intersection Location	Jurisdiction	Recommended Improvements				Improvements in TUMF or DIF[1]?	Fair Share %[2]
			Existing (2014)	EAP (2017)	EAPC (2017)	Horizon Year (2035) With Project		
8	Nancy Av. (NS) / Cherry Valley Bl.	County of Riverside				- Traffic Signal - EB left turn lane - 2nd EB through lane - WB left turn lane - 2nd EB through lane	No No Yes (TUMF) No Yes (TUMF)	1.5%
9	Beaumont Ave. / Cherry Valley Bl.	County of Riverside				- 2nd EB through lane - 2nd WB through lane - Modify the traffic signal in order to provide overlap phasing for the EB right turn lane.	Yes (TUMF) Yes (TUMF) No	1.5%

[1] Improvements are identified as being included in the Western Riverside Council of Governments (WRCOG) Transportation Uniform Mitigation Fee (TUMF) program or as a County of Riverside DIF facility.

[2] Program improvements constructed by project may be eligible for fee credit, at discretion of County of Riverside. See Table 9-2 for Fair Share Calculations.

[3] As shown on Tables 6-5, 6-6, and 7-4 and discussed in the TIA, a preliminary roundabout interchange design has been analyzed for EAP (2017), EAPC (2017), and Horizon Year (2035) With Project conditions as an alternative to the improvements listed in this table. As the I-10 Freeway and Cherry Valley Boulevard interchange is a TUMF facility, the Project's TUMF payment will be the same regardless of the improvement alternatives implemented. Further discussion of the roundabout alternative at the I-10 Freeway and Cherry Valley Boulevard interchange can be found in Section 6.8 *Recommended Improvements for EAP and EAPC (2017) Conditions* and Section 7.8 *Recommended Improvements for Horizon Year (2035) Conditions* .

[4] I-10 Freeway and Cherry Valley Boulevard interchange is identified in the WRCOG Pass Area TUMF zone.

Valley interchange to mitigate project impacts.

Mitigation Measure 1A

(a) Prior to the issuance of occupancy permits, the project applicant shall pay the project's fair share toward the construction of the new interchange at the I-10 eastbound and westbound intersections at Cherry Valley Boulevard, provided that the City of Calimesa has established a fair share contribution program for such improvements. The County shall determine whether a fair share program exists in the City of Calimesa and, if one does exist, the fair share payment due from the applicant to the City of Calimesa shall be 5.8 % at the I-10 EB ramps/Cherry Valley Boulevard and 10.6% at I-10 WB ramps/Cherry Valley Boulevard, as determined in the traffic study.

(b) If a fair share contribution program has not been established, and provided that both Caltrans and the City of Calimesa authorize construction within their respective jurisdictional control, the project applicant shall construct the following interim improvements prior to the issuance of occupancy permits:

- Install traffic signals at I-10 eastbound and westbound ramp intersections at Cherry Valley Boulevard,
- Restripe to provide eastbound and westbound left turn pockets within the existing width of the Cherry Valley Boulevard bridge,
- Add a southbound right turn lane on the off ramp at the intersection of I-10 EB ramps at Cherry Valley Boulevard, and
- Add a westbound right turn lane at the intersection of I-10 WB ramps at Cherry Valley Boulevard.

Mitigation Measure 1B

(a) Prior to the issuance of occupancy permits, the project applicant shall pay the project's fair share costs to realign Calimesa Boulevard approximately 550 feet east of the I-10 westbound ramps and construct an eastbound left turn lane at the intersection of Calimesa Boulevard and Cherry Valley Boulevard, provided that the City of Calimesa has established a fair share contribution program for this intersection. The County shall determine whether a fair share program exists in the City of Calimesa and, if one does exist, the fair share payment due from the applicant to the City of Calimesa shall be 12.1%, as determined in the traffic study.

(b) If a fair share contribution program has not been established, and provided that the City of Calimesa authorizes construction within its jurisdictional control, the project applicant shall, prior to the issuance of occupancy permits:

- Realign Calimesa Boulevard approximately 550 feet east of the I-10 westbound ramps; and

- Construct an eastbound left turn lane at the intersection of Calimesa Boulevard and Cherry Valley Boulevard.

A supplemental traffic analysis to assess the interim traffic signals and other improvements at the interchange ramps, including vehicle queues and potential impact to operations of the adjacent Calimesa Boulevard at Cherry Valley Boulevard intersection is provided in *San Gorgonio Crossing Supplemental Traffic Analysis* dated June 9, 2016, prepared by Urban Crossroads.

1.6 On-Site Roadway and Site Access Improvements

1.6.1 On-Site Roadway Improvements

The Project is proposed to have access on Cherry Valley Boulevard via Driveway 1, Street 2 and Driveway 3. Street 2 is proposed to be full-access. Driveways 1 and 3 will be restricted to right-in/right-out access only.

Roadway improvements necessary to provide site access and on-site circulation are assumed to be constructed in conjunction with site development and are described below. These improvements should be in place prior to occupancy. The recommended site-adjacent roadway improvements for the Project are described below and illustrated on Exhibit 1-3.

Cherry Valley Boulevard - Construct Cherry Valley Boulevard from the westerly Project boundary to the easterly Project boundary at its ultimate half-section width as an Arterial Highway (128-foot right-of-way) consistent with the Riverside County General Plan Circulation Element. Construct a raised median on Cherry Valley Boulevard to enforce right-in/right-out access at Driveway 1 and Driveway 3.

Street 2 - Construct Street 2 from the Project's Private Roadway to Cherry Valley Boulevard as a Public Street at its ultimate full-section width as an Industrial Collector (78-foot right-of-way).

Private Roadway - Construct Project's Private Roadway from northerly Project boundary to its connection with Street 2 as a 56-foot paved section.

Driveway 3 - Construct Driveway 3, north of Cherry Valley Boulevard, at its ultimate full-section width as an Industrial Collector (78-foot right-of-way).

Specific lane geometrics at each Project access point are discussed subsequently in *Section 1.6.2 Site Access Improvements*.

1.6.2 Site Access Improvements

The recommended site access driveway improvements for the Project are described below. Exhibit 1-4 illustrates the on-site and the minimum site adjacent recommended roadway lane improvements. Construction of on-site and site adjacent improvements shall occur in conjunction with adjacent Project development activity or as needed for Project access purposes.

EXHIBIT 1-3: SITE ADJACENT ROADWAY RECOMMENDATIONS

CVAR_11211

N

URBAN CROSSROADS

Driveway 1 at Cherry Valley Boulevard – Install a stop control on the southbound approach and construct the intersection with right-in/right-out access only in conjunction with the following geometrics:

Northbound Approach: N/A

Southbound Approach: One right turn lane.

Eastbound Approach: One through lane.

Westbound Approach: One shared through-right turn lane.

Street 2 at Cherry Valley Boulevard – Install a traffic signal and construct the intersection with the following geometrics:

Northbound Approach: N/A.

Southbound Approach: One left turn lane and one shared through-right turn lane.

Eastbound Approach: One left turn lane with a minimum of 250-feet of storage and one through lane. Westbound Approach: One shared through-right turn lane.

Driveway 3 at Cherry Valley Boulevard – Install a stop control on the southbound approach and construct the intersection with right-in/right-out access only in conjunction with the following geometrics:

Northbound Approach: N/A

Southbound Approach: One right turn lane.

Eastbound Approach: One through lane.

Westbound Approach: One shared through-right turn lane.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the Project site. Sight distance at each Project access driveway should be reviewed with respect to Caltrans and County of Riverside sight distance standards at the time of preparation of final grading, landscape and street improvement plans.

This page is intentionally left blank

2 METHODOLOGIES

This section documents the methodologies and assumptions used to perform this TIA.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The *Highway Capacity Manual* (HCM) 2010 methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (4) The HCM uses different procedures depending on the type of intersection control.

The intersection LOS analysis is based on the traffic volumes observed during the peak hour conditions using traffic count data collected in April 2014. The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

2.2.1 SIGNALIZED INTERSECTIONS

The County of Riverside requires signalized intersection operations analysis based on the methodology described in Chapter 18 and Chapter 31 of the HCM 2010. (4) Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1.

TABLE 2-1 SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths	80.01 and up	F	F

Source: HCM 2010, Chapter 18

Per the Caltrans *Guide for the Preparation of Traffic Impact Studies*, the traffic modeling and signal timing optimization software package Synchro (Version 8 Build 805) has been utilized to analyze signalized intersections under Caltrans' jurisdiction, which include interchange to arterial ramps (i.e. I-10 Freeway ramps at Cherry Valley Boulevard). All other study area intersections have also been analyzed with the Synchro software package. Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the Chapters 18 and 31 of the HCM 2010. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length. The LOS and capacity analysis performed by Synchro take into consideration optimization and coordination of signalized intersections within a network.

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15 minute volumes. Common practice for LOS analysis is to use a peak 15-mintue rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g. PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for Existing (2014) and EAP (2017) traffic conditions. A PHF of 0.92 or higher has been used for EAPC (2017) traffic conditions. Lastly, a PHF of 0.95 or higher has been used for all intersections with the exception of driveways for long-range Horizon Year (2035) without and with Project traffic conditions. A PHF of 0.92 has been used for Project driveways for Horizon Year (2035) with Project conditions.

2.2.2 UNSIGNALIZED INTERSECTIONS

The County of Riverside requires the operations of unsignalized intersections be evaluated using the methodology described in Chapter 19, Chapter 20 and Chapter 32 of the HCM 2010. (4) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2).

TABLE 2-2 UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM 2010, Chapter 19 and Chapter 20

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. For all-way stop controlled intersections, LOS is computed for the intersection as a whole. All unsignalized study area intersections have been analyzed using Synchro software.

2.3 FREEWAY MAINLINE SEGMENT ANALYSIS

The freeway system in the study area has been broken into segments defined by the freeway-to-arterial interchange locations. The freeway segments have been evaluated in this TIA based upon peak hour directional volumes. The freeway segment analysis is based on the methodology described in Chapter 11 of the HCM 2010 and performed using HCS 2010 software. (4) The performance measure preferred by Caltrans to calculate LOS is density. Density is expressed in terms of passenger cars per mile per lane. Table 2-3 illustrates the freeway segment LOS thresholds for each density range utilized for this analysis.

TABLE 2-3 FREEWAY MAINLINE LOS THRESHOLDS

Level of Service	Description	Density Range (pc/mi/ln)1
A	Free-flow operations in which vehicles are relatively unimpeded in their ability to maneuver within the traffic stream. Effects of incidents are easily absorbed.	0.0 – 11.0
B	Relative free-flow operations in which vehicle maneuvers within the traffic stream are slightly restricted. Effects of minor incidents are easily absorbed.	11.1 – 18.0
C	Travel is still at relative free-flow speeds, but freedom to maneuver within the traffic stream is noticeably restricted. Minor incidents may be absorbed, but local deterioration in service will be substantial. Queues begin to form behind significant blockages.	18.1 – 26.0
D	Speeds begin to decline slightly and flows and densities begin to increase more quickly. Freedom to maneuver is noticeably limited. Minor incidents can be expected to create queuing as the traffic stream has little space to absorb disruptions.	26.1 – 35.0
E	Operation at capacity. Vehicles are closely spaced with little room to maneuver. Any disruption in the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. Any incident can be expected to produce a serious disruption in traffic flow and extensive queuing.	35.1 – 45.0
F	Breakdown in vehicle flow.	>45.0

[1] *pc/mi/ln = passenger cars per mile per lane. Source: HCM 2010, Chapter 11*

2.4 FREEWAY MERGE/DIVERGE RAMP JUNCTION ANALYSIS

The freeway system in the study area has been broken into segments defined by freeway-to-arterial interchange locations resulting in four (4) existing on and off ramp locations. Although the HCM indicates the influence area for a merge/diverge junction is 1,500 feet, the analysis presented in this traffic study has been performed at all ramp locations with respect to the nearest on or off ramp at each interchange in an effort to be consistent with Caltrans guidance/comments on other projects Urban Crossroads has worked on.

The merge/diverge analysis is based on the HCM 2010 Freeway Merge and Diverge Segments analysis method and performed using HCS2010 software. (4) The measure of effectiveness (reported in passenger car/mile/lane) are calculated based on the existing number of travel lanes, number of lanes at the on and off ramps both at the analysis junction and at upstream and downstream locations (if applicable) and acceleration/deceleration lengths at each merge/diverge point. Table 2-4 presents the merge/diverge area level of service thresholds for each density range utilized for this analysis.

TABLE 2-4 FREEWAY MERGE AND DIVERGE LOS THRESHOLDS

Level of Service	Density Range (pc/mi/ln)[1]
A	≤10.0
B	10.0 – 20.0
C	20.0 – 28.0
D	28.0 – 35.0
E	>35.0
F	Demand Exceeds Capacity

[1] pc/mi/ln = passenger cars per mile per lane. Source: HCM 2010, Chapter 13

2.5 FREEWAY OFF-RAMP QUEUING

Consistent with Caltrans requirements, the progression of vehicles has been assessed to determine potential queuing impacts at the freeway ramp intersections on the off-ramps at Cherry Valley Boulevard. The traffic progression analysis tool and HCM intersection analysis program, Synchro, has been used to assess the potential impacts/needs of the intersections with traffic added from the proposed Project. Storage (turn-pocket) length recommendations at the ramps have been based upon the 95th percentile queue resulting from the Synchro progression analysis. The 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes. The queue length reported is for the lane with the highest queue in the lane group.

Traffic is simulated for two complete cycles of the 95th percentile traffic in Synchro in order to account for the effects of spillover between cycles. In practice, the 95th percentile queue shown will rarely be exceeded and the queues shown with the footnote are acceptable for the design of storage bays.

A vehicle is considered queued whenever it is traveling at less than 10 feet/second. A vehicle will only become queued when it is either at the stop bar or behind another queued vehicle. Although only the 95th percentile queue has been reported in the tables, the 50th percentile queue can be found in the appendix alongside the 95th percentile queue for each ramp location. The 50th percentile maximum queue is the maximum back of queue on a typical cycle during the peak hour, while the 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes during the peak hour. In other words, if traffic were observed for 100 cycles, the 95th percentile queue would be the queue experienced with the 95th busiest cycle (or 5% of the time). The 50th percentile or average queue represents the typical queue length for peak hour traffic conditions, while the 95th percentile queue is derived from the average queue plus 1.65 standard deviations. The 95th percentile queue is not necessarily ever observed, it is simply based on statistical calculations.

2.6 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TIA uses the signal warrant criteria presented in the latest edition of the Federal Highway Administration's (FHWA) Manual on Uniform Traffic Control Devices (MUTCD), as amended by the MUTCD 2012 California Supplement, for all study area intersections. (5)

The signal warrant criteria for Existing (2014) conditions are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. Both the FHWA's MUTCD and the MUTCD 2012 California Supplement indicate that the installation of a traffic signal should be considered if one or more of the signal warrants are met. Specifically, this TIA utilizes the Peak Hour Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing intersections. Warrant 3 criteria are basically identical for both the FHWA's MUTCD and the MUTCD 2012 California Supplement. Warrant 3 is appropriate to use for this TIA because it provides specialized warrant criteria for intersections with rural characteristics (e.g. located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection. It should be noted that for the purposes of this analysis, the peak hour warrant has also been utilized at study area locations under future traffic conditions if the planning level ADT warrant was not met.

Future unsignalized intersections have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets.

Traffic signal warrant analyses were performed for the following unsignalized study area intersections:

ID	Intersection Location	Jurisdiction
1	I-10 Freeway EB Ramps / Cherry Valley Boulevard	Caltrans
2	I-10 Freeway WB Ramps / Cherry Valley Boulevard	Caltrans
3	Calimesa Boulevard / Cherry Valley Boulevard	RivCo, Calimesa
5	Street 2 / Cherry Valley Boulevard - Future Intersection	Riverside County
7	Union Street / Cherry Valley Boulevard	Riverside County
8	Nancy Avenue / Cherry Valley Boulevard	Riverside County

The existing conditions traffic signal warrant analysis is presented in the subsequent section, Section 3 Area Conditions of this report. The traffic signal warrant analysis for future conditions is presented in Section 5 Existing plus Project Traffic Analysis, Section 6 Opening Year (2017) Traffic Analysis and Section 7 Horizon Year (2035) Traffic Analysis of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with level of service. An intersection may satisfy a signal warrant condition and operate at or above LOS "C" or operate below LOS "C" and not meet a signal warrant.

2.7 LOS CRITERIA

County of Riverside

County of Riverside General Plan Policy C 2.1 states that the County will maintain the following County-wide target level of service (LOS): LOS "C" on all County-maintained roads and conventional State Highways. As an exception, LOS "D" is allowed in Community Development areas at intersections of any combination of Secondary Highways, Major Highways, Arterial Highways, Urban Arterial Highways, Expressways or conventional State Highways. Finally, LOS "E" may be allowed in designated Community Centers to the extent that it would support transit-oriented development and pedestrian communities.

City of Calimesa

The City of Calimesa General Plan states that arterial roads should carry both local and through traffic and be improved to maintain a Level of Service "C" or better. As such, LOS "C" has been considered acceptable at any intersection within the City of Calimesa.

Caltrans

Caltrans considers LOS "D" to be the limit of acceptable traffic operations during the peak hour at freeway ramp intersections, basic freeway segments and merge/diverge ramp junctions maintained by Caltrans.

Table 2-5 shows the LOS criteria for each of the study area intersections.

TABLE 2-5 INTERSECTION LEVEL OF SERVICE CRITERIA

ID	Intersection Location	Jurisdiction	Acceptable LOS
1	I-10 Freeway EB Ramps / Cherry Valley Boulevard	Caltrans	D
2	I-10 Freeway WB Ramps / Cherry Valley Boulevard	Caltrans	D
3	Calimesa Boulevard / Cherry Valley Boulevard	RivCo, Calimesa	C
4	Driveway 1 / Cherry Valley Bl.(RIRO)	Riverside County	D
5	Street 2 / Cherry Valley Boulevard	Riverside County	D
6	Driveway 3 / Cherry Valley Bl. (RIRO)	Riverside County	D
7	Union St. / Cherry Valley Boulevard	Riverside County	D
8	Nancy Av. / Cherry Valley Boulevard	Riverside County	D
9	Beaumont Av. / Cherry Valley Boulevard	Riverside County	D

2.8 PROJECT FAIR SHARE CALCULATION METHODOLOGY

In cases where this TIA identifies that the proposed Project would have a significant cumulative impact to a roadway facility, and the recommended mitigation measure is a fair share monetary contribution, the following methodology was applied to determine the fair share contribution. A project's fair share contribution at an off-site study area intersection is determined based on the following equation, which is the ratio of project traffic to new traffic, and new traffic is total future traffic subtracts existing baseline traffic:

Project Fair Share % = Project Traffic / (Total Traffic – Existing Baseline Traffic)

The project fair share contribution calculations are presented in Section 9 *Local and Regional Funding Mechanisms* of this TIA.

This page is intentionally left blank

3 AREA CONDITIONS

This section provides a summary of the existing circulation network, the County of Riverside General Plan Circulation Network, and a review of existing peak hour intersection operations and traffic signal warrants.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to the approved Traffic Study Scoping Agreement (Appendix "1.1") and discussion with the County of Riverside staff, the study area includes a total of nine (9) existing and future intersections as shown on Exhibit 1-2. Of these nine intersections, the existing study area circulation network includes six intersection analysis locations shown on Table 1-1. The other three intersections in the study area are future Project access points that do not currently exist.

Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 GENERAL PLAN CIRCULATION ELEMENTS

As previously noted, the Project site is located within the County of Riverside. Exhibit 3-2 shows the County of Riverside General Plan Circulation Element, and Exhibit 3-3 illustrates the County of Riverside General Plan roadway cross-sections.

3.3 TRANSIT SERVICE

The study area is currently served by the Pass Transit with bus services along Cherry Valley Boulevard through Route 7. Pass transit routes in the vicinity of Project are shown on Exhibit 3-4.

3.4 EXISTING TRAFFIC COUNTS

The AM peak hour traffic volumes were determined by counting traffic volumes in the two hour period between 7:00 and 9:00 AM in April 1, 2014. Similarly, the PM peak hour traffic volumes were identified by counting traffic volumes in the two hour period from 4:00 to 6:00 PM in April 1, 2014. The April 2014 count data are representative of typical weekday peak hour traffic conditions in the study area. There were no observations made in the field that would indicate atypical traffic conditions on this date, such as construction activity or detour routes.

The raw manual peak hour turning movement traffic count data sheets are included in Appendix "3.1". The traffic counts collected on April 1, 2014 include the vehicle classifications as shown below:

- Passenger Cars
- 2-Axle Trucks
- 3-Axle Trucks
- 4 or More Axle Trucks

CVAR_11228

To represent the impact large trucks, buses and recreational vehicles have on traffic flow; all trucks were converted into Passenger Car Equivalents (PCEs). By their size alone, these vehicles occupy the same space as two or more passenger cars. In addition, the time it takes for them to accelerate and decelerate is greater than for passenger cars, and varies depending on the type of vehicle and number of axles. For the purpose of this analysis, a PCE factor of 1.5 has been applied to 2-axle trucks, 2.0 for 3-axle trucks and 3.0 for 4+-axle trucks to estimate each turning movement.

Existing (2014) average daily traffic (ADT) volumes on arterial highways throughout the study area are shown on Exhibit 3-5. Existing (2014) ADT volumes are based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

PM Peak Hour (Approach Volume + Exit Volume) x 12 = Leg Volume

A comparison of PM peak hour traffic count data to 24-hour count data indicated that the PM peak hour volumes were approximately eight to nine percent of the total 24-hour daily volume on select roadway segments. This same relationship (i.e., PM peak hour traffic volumes equate to 8-9 percent of average daily traffic volumes) was applied in estimating average daily roadway segment traffic volumes throughout the study area.

Existing (2014) AM and PM peak hour intersection volumes are shown on Exhibits 3-6 and 3-7, respectively. All of the traffic volumes illustrated on the exhibits and used in the traffic analysis are shown in terms of PCE.

3.5 EXISTING CONDITIONS INTERSECTION OPERATIONS ANALYSIS

Existing (2014) baseline peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results provided on Table 3-1 shows that the following intersection analysis location currently experiences unacceptable conditions.

ID	Intersection
1	I-10 EB Ramps / Cherry Valley Boulevard – LOS "F" PM Peak Hour only
2	I-10 WB Ramps / Cherry Valley Boulevard – LOS "F" AM Peak Hour only

Consistent with Table 3-1, a summary of the peak hour intersection LOS for Existing (2014) conditions are shown in Exhibit 3-8. The intersection operations analysis worksheets for Existing (2014) traffic conditions are included in Appendix "3.2" of this TIA.

3.6 EXISTING CONDITIONS TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for existing traffic conditions are based on existing peak hour intersection turning volumes. For Existing (2014) traffic conditions, the following intersection currently appears to warrant traffic signal (See Appendix "3.3"):

ID	Intersection Location	Jurisdiction
1	I-10 EB Ramps / Cherry Valley Boulevard	Caltrans

Although not warranted, the intersection of I-10 Westbound Ramps at Cherry Valley Boulevard is anticipated to operate at unacceptable LOS during the AM peak hour without the installation of a traffic signal. The addition of lanes is not anticipated to improve the deficient peak hour LOS at this intersection. As such, it is recommended that this location be monitored, and the Caltrans Traffic Engineer should implement engineering judgment and his/her discretion on the installation of a traffic signal.

3.7 RECOMMENDED IMPROVEMENTS FOR EXISTING (2014) CONDITIONS

Table 3-2 lists the improvement needs recommended to reduce each deficient location's peak hour delay and associated LOS grade back to acceptable levels for Existing (2014) conditions.

Existing (2014) intersection operations analysis worksheets, with improvements, are provided in Appendix "3.4".

3.8 EXISTING CONDITIONS FREEWAY SEGMENT ANALYSIS

Existing (2014) mainline directional volumes for the AM and PM peak hours are provided on Exhibit 3-9. As shown on Table 3-3, the I-10 Freeway segments analyzed for this study were found to operate at LOS "C" or better during the peak hours for Existing (2014) traffic conditions. Existing (2014) basic freeway segment analysis worksheets are provided in Appendix "3.5".

3.9 EXISTING CONDITIONS FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations were also evaluated for Existing (2014) conditions and the results of this analysis are presented in Table 3-4. As shown in Table 3-4, the I-10 Freeway ramp merge and diverge areas at Cherry Valley Boulevard currently operate at LOS "C" or better during the peak hours under Existing (2014) traffic conditions. Existing (2014) freeway ramp junction operations analysis worksheets are provided in Appendix "3.6".

EXHIBIT 3-9: EXISTING (2014) I-10 FREEWAY MAINLINE VOLUMES

4 PROJECTED FUTURE TRAFFIC

This section presents the traffic volumes estimated to be generated by the Project, as well as the Project's trip assignment onto the study area roadway network. The Project is located north of Cherry Valley Boulevard and approximately 1,800 feet east of the I-10 / Cherry Valley Boulevard interchange in unincorporated County of Riverside.

The Project includes the development of 1,860,760 square feet of high-cube logistics warehouse use between two (2) buildings. The proposed intensity for each of the buildings is listed below:

- Building 1 – 737,480 square feet of high-cube warehouse use with access to Cherry Valley Boulevard via Driveway 1 and Street 2.
- Building 2 – 1,123,280 square feet of high-cube warehouse use with access to Cherry Valley Boulevard via Street 2 and Driveway 3.

For the purposes of this traffic analysis, the Project has been assumed to be developed in a single phase with a proposed opening year of 2017.

Site access is provided along Cherry Valley Boulevard via Driveway 1, Street 2 (proposed public street) and Driveway 3. Street 2 is assumed to allow full-access. Driveways 1 and 3 have been assessed assuming restricted right-in/right-out access only. The Project will construct improvements on the site adjacent roadway of Cherry Valley Boulevard as indicated in the Conditions of Approval. Regional access to the Project site will be provided by the I-10 Freeway via Cherry Valley Boulevard.

4.1 PROJECT TRIP GENERATION

In order to estimate the traffic characteristics of the proposed Project, trip-generation statistics published in the most recent release of the Institute of Transportation Engineers (ITE) Trip Generation (9th Edition, 2012) manual for the proposed land use (ITE Land Use Code 152 – High-Cube Warehousing) was used. This particular rate was selected based on our understanding of the Project's design and operating characteristics. Trip generation rates for the Project are shown in Table 4-1. Refinements to these raw trip generation estimates have been made to provide a more detailed breakdown of trips by vehicle mix. The vehicle mix percentages were obtained from data collected by the South Coast Air Quality Management District (SCAQMD) and applied to ITE truck trip generation rates for land use code 152 (High-Cube Warehousing).

In addition, Passenger Car Equivalents (PCE) factors have been applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCE factors have been utilized due to the expected heavy truck component for the proposed Project uses. PCE factors allow the typical "real-world" mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, for the purposes of capacity and level of service analyses. PCE factors are

Table 4-1

[1] Trip Generation Source: Institute of Transportation Engineers (ITE), Trip Generation Manual, Ninth Edition (2012).

[2] Vehicle Mix Source: Total truck percentage source from ITE Trip Generation manual. Truck mix (by axle type) source from SCAQMD.

AM peak hour = 72.7% passenger cars, 6.01% 2-Axle trucks, 4.83% 3-Axle trucks, 16.46% 4-Axle trucks

PM peak hour = 66.7% passenger cars, 7.33% 2-Axle trucks, 5.89% 3-Axle trucks, 20.08% 4-Axle trucks

ADT = 61.9% passenger cars, 8.38% 2-Axle trucks, 6.74% 3-Axle trucks, 22.98% 4-Axle trucks

[3] TSF = thousand square feet

[4] TOTAL TRIPS = Passenger Cars + Net Truck Trips

applied to large truck types such as large 2-axles, 3-axles, 4+-axles. A PCE factor of 1.5 has been applied to large 2-axle trucks, a factor of 2.0 for 3-axle trucks and a factor of 3.0 for 4+-axle trucks. These PCE factors are consistent with the values recommended by the San Bernardino Associated Governments (SANBAG) and are accepted factors in the County of Riverside.

Project daily and peak hour trip generation by vehicle type are illustrated in Table 4-1 (actual vehicles) and Table 4-2 (in PCE). The proposed Project is anticipated to generate a net total of approximately 3,126 (4,905 PCE) net trip-ends per day on a typical weekday with approximately 205 (288 PCE) net AM peak hour trips and 223 (335 PCE) net PM peak hour trips.

4.2 PROJECT TRIP DISTRIBUTION

Trip distribution is the process of identifying the probable destinations, directions or traffic routes that will be utilized by Project traffic. The potential interaction between the planned land uses and surrounding regional access routes are considered, to identify the route where the Project traffic would distribute. The Project trip distribution was developed based on anticipated travel patterns to and from the Project site for both passenger cars and truck traffic.

The Project passenger car trip distribution pattern is graphically depicted on Exhibit 4-1. The Project truck trip distribution pattern is graphically depicted on Exhibit 4-2. Each of these distribution patterns was reviewed and approved by the County of Riverside as part of the traffic study scoping process (see Appendix 1.1). Both the passenger car and truck trip distribution patterns take into consideration the access restrictions at Driveways 1 and 3.

4.3 MODAL SPLIT

Although the use of public transit, walking, and/or bicycling have the potential to reduce some Project-related vehicular for passenger cars only, such reductions have not been taken into considerations in this traffic study in order to provide a conservative analysis of the Project's potential to result in significant traffic impacts.

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project average daily traffic (ADT) volumes for the weekday are shown on Exhibit 4-3. Project AM and PM peak hour volumes are shown on Exhibits 4-4 and 4-5, respectively.

4.5 BACKGROUND TRAFFIC

Opening year traffic forecasts have been based upon three years of background (ambient) growth at 2% per year for Opening Year (2017) traffic conditions. The ambient growth factor is

URBAN CROSSROADS

intended to approximate regional traffic growth. The total ambient growth is 6.12% for 2017 traffic conditions (compounded growth of two percent per year over three years or $1.02^{3 \text{ years}}$). This ambient growth rate is added to existing traffic volumes to account for area-wide growth not reflected by cumulative development projects. Ambient growth has been added to daily and peak hour traffic volumes on surrounding roadways, in addition to traffic generated by the development of future projects that have been approved but not yet built and/or for which development applications have been filed and are under consideration by governing agencies. Thus the cumulative impact analysis performed in this report is conservative.

The adopted Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) (April 2012) growth forecasts for Riverside County identifies projected growth in population of 2,128,000 in 2008 to 3,324,000 in 2035, or a 56.2% increase over the 27 year period. The change in population equates to roughly a 1.67 percent growth rate compounded annually. Similarly, growth over the same 27 year period in households is projected to increase by 60.8 percent, or 1.78 percent annual growth rate. Finally, growth in employment over the same 27 year period is projected to increase by 87.2 percent, or a 2.35 percent annual growth rate. (6) Therefore, the annual growth rate of 2% in conjunction with cumulative project traffic would appear to be conservative and tend to overstate as opposed to understate future traffic growth..

4.6 CUMULATIVE DEVELOPMENT TRAFFIC

CEQA guidelines require that other reasonably foreseeable development projects which are either approved or being processed concurrently in the study area also be included as part of a cumulative analysis scenario. A cumulative project list was developed for the purposes of this analysis through consultation with staff from the County of Riverside. In addition, cumulative development projects were also obtained from adjacent jurisdictions (i.e., City of Beaumont and City of Calimesa). Exhibit 4-6 illustrates the cumulative development location map. A summary of cumulative development projects and their proposed land uses are shown on Table 4-3. If applicable, the traffic generated by individual cumulative projects was manually added to both the EAPC (2017) and Horizon Year (2035) forecasts to ensure that traffic generated by the listed cumulative development projects in Table 4-3 are reflected as part of the background traffic.

4.7 TRAFFIC FORECASTS

To provide a comprehensive assessment of the potential future cumulative traffic impacts, two types of analyses, “buildup” and “buildout”, have been performed for the purposes of this report. The “buildup” method was used to approximate the EAP (2017) traffic conditions, and is intended to identify the significant impacts on both the existing and planned opening year circulation system. The EAP (2017) traffic conditions include background traffic in addition to the traffic generated by the proposed Project. The “buildup” method was also utilized to

[1] TSF = Thousand Square Feet; DU = Dwelling Unit; ST=Students

[2] Commercial / Industrial Square Footage calculated based on FAR of 0.25

[3] General Plan Land Use obtained from Heartland Tentative Tract Map 27971 TIA, October 3, 2006 by Urban Crossroads

[4] Land Use and Quantity obtained from Potrero Blvd Interchange, Phase 1 Focused Traffic Analysis, September 26, 2011 by Urban Crossroads

approximate the EAPC (2017) conditions, and is intended to identify the cumulative impacts on both the existing and planned opening year circulation system. The EAPC (2017) traffic conditions include background traffic, traffic generated by other cumulative development projects within the study area and the traffic generated by the proposed Project. The buildout approach is used to forecast the long-range Horizon Year (2035) conditions of the focused study area.

4.8 OPENING YEAR (2017) CONDITIONS

The "buildup" approach combines existing traffic counts with a background ambient growth factor to forecast the opening year 2017 traffic conditions. An ambient growth factor of 6.12% (2017) account for background (area-wide) traffic increases that occur over time up to the year 2017 from the year 2014 (compounded two percent per year growth over a three year period). Traffic volumes generated by the Project are then added to assess the EAP and EAPC (2017) traffic conditions. The 2017 roadway networks are similar to the existing conditions roadway network with the exception of the Project driveways.

The opening year traffic analysis includes the following traffic conditions, with the various traffic components:

- EAP (2017) Conditions
    - Existing 2014 counts
    - Ambient growth traffic (6.12%)
    - Project traffic
- EAPC (2017) Conditions
    - Existing 2014 counts
    - Ambient growth traffic (6.12%)
    - Project Traffic
    - Cumulative Development traffic

4.9 HORIZON YEAR (2035) CONDITIONS

Traffic projections for Horizon Year (2035) with Project conditions were derived from the County of Riverside Traffic Analysis Model (RivTAM) using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between Existing conditions and Horizon Year (2035) conditions. In many cases, the traffic model zone structure is not designed to provide accurate turning movements at each study area intersection along arterial roadways unless refinement and reasonableness checking is performed. Therefore, the Horizon Year (2035) peak hour forecasts were refined using the long-range forecasts, along with existing peak hour traffic count data collected at each study area intersections. Future estimated peak hour traffic data has been used for new intersections and intersections with an anticipated change in travel patterns in an effort to further refine the Horizon Year (2035) peak hour forecasts. Lastly, Horizon Year (2035) turning volumes were compared to EAPC (2017) volumes in order to ensure reasonable growth as a part of the

refinement process. A minimum of ten percent growth between EAPC (2017) and Horizon Year (2035) traffic conditions has been used to account for traffic generated by cumulative development projects and the ambient growth between existing and EAPC (2017) conditions.

Post processing worksheets for Horizon Year (2035) without Project traffic conditions are provided in Appendix "4.1".

This page is intentionally left blank

5 EXISTING PLUS PROJECT TRAFFIC CONDITIONS

This section discusses the traffic forecasts for Existing plus Project (E+P) conditions and the resulting intersection and freeway mainline operations.

5.1 EXISTING PLUS PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes existing (2014) traffic volumes plus Project traffic. Exhibit 5-1 shows the ADT volumes which can be expected for E+P traffic conditions. E+P AM and PM peak hour intersection turning movement volumes are shown on Exhibits 5-2 and 5-3, respectively.

5.2 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 Methodologies of this TIA. The intersection analysis results are summarized in Table 5-1. There are no additional intersections anticipated to operate at an unacceptable LOS under E+P traffic conditions in addition to the intersections previously identified under Existing (2014) conditions.

Exhibit 5-4 summarizes the weekday AM and weekday PM peak hour study area intersection LOS under E+P traffic conditions, consistent with the summary provided in Table 5-1. The intersection operations analysis worksheets for E+P traffic conditions are included in Appendix "5.1" of this TIA.

5.3 EXISTING PLUS PROJECT TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for E+P traffic conditions are based on E+P volumes. For E+P conditions, the following intersections appear to warrant a traffic signal, in addition to the intersections identified in Section 3.7 *Existing Conditions Traffic Signal Warrants Analysis* (See Appendix "5.2"):

ID	Intersection Location	Jurisdiction
2	I-10 WB Ramps / Cherry Valley Boulevard	Caltrans
5	Street 2 / Cherry Valley Boulevard	Riverside County

5.4 BASIC FREEWAY SEGMENT ANALYSIS

E+P mainline directional volumes for the AM and PM peak hours are provided on Exhibit 5-5. Mainline segment analysis results for the AM and PM peak hours are summarized on Table 5-2. As shown on Table 5-2, the freeway segments analyzed along the I-10 Freeway are anticipated to operate at acceptable levels of service (i.e., LOS "D" or better) during the peak hours for E+P traffic conditions. E+P basic freeway segment analysis worksheets are provided in Appendix "5.3".

6 OPENING YEAR (2017) TRAFFIC ANALYSIS

This section discusses the methods used to develop EAP (2017) and EAPC (2017) traffic forecasts, and the resulting intersection operations.

6.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for EAP (2017) and EAPC (2017) conditions are consistent with those shown previously on Exhibit 3-1, with the exception of Project driveways and those facilities assumed to be constructed by the Project to provide site access are also assumed to be in place for EAP (2017) and EAPC (2017) conditions.

6.2 EAP (2017) TRAFFIC VOLUME FORECASTS

This scenario includes Existing (2014) traffic volumes plus an ambient growth factor of 6.12% and the addition of Project traffic. The weekday ADT volumes which can be expected for EAP (2017) traffic conditions are shown on Exhibit 6-1. Exhibits 6-2 and 6-3 show the weekday AM and weekday PM peak hour intersection turning movement volumes for EAP (2017) traffic conditions.

6.3 EAPC (2017) TRAFFIC VOLUME FORECASTS

This scenario includes Existing (2014) traffic volumes, an ambient growth factor of 6.12%, traffic from pending and approved but not yet constructed known development projects in the area and the addition of Project traffic. The ADT volumes which can be expected for EAPC (2017) traffic conditions are shown on Exhibit 6-4. Exhibits 6-5 and 6-6 show the weekday AM and weekend PM peak hour intersection turning movement volumes for EAPC (2017) traffic conditions.

6.4 INTERSECTION OPERATIONS ANALYSIS

6.4.1 EAP (2017) TRAFFIC CONDITIONS

Level of service calculations were conducted for the study intersections to evaluate their operations under EAP (2017) conditions with existing roadway and intersection geometrics consistent with Exhibit 3-1. As shown in Table 6-1, there are no additional intersections anticipated to operate at an unacceptable LOS under EAP (2017) traffic conditions beyond those previously identified for Existing (2014) conditions.

Consistent with Table 6-1, the weekday AM and PM peak hour intersection LOS are summarized on Exhibit 6-7 for EAP (2017) traffic conditions. The intersection operations analysis worksheets for EAP (2017) conditions are included in Appendix "6.1" of this TIA. Recommended improvements necessary to bring peak hour intersection operations within acceptable levels for EAP (2017) traffic conditions are discussed in Section 6.8 *Recommended Improvements for EAP and EAPC (2017) Conditions*.

6.4.2 EAPC (2017) TRAFFIC CONDITIONS

Level of service calculations were conducted for the study intersections to evaluate their operations under EAPC (2017) conditions with existing roadway and intersection geometrics consistent with Exhibit 3-1. As shown in Table 6-2, the following additional intersection is anticipated to operate at unacceptable LOS as compared to those previously identified under Existing (2014) and EAP (2017) traffic conditions.

ID	Intersection Location
3	Calimesa Bl. / Cherry Valley Bl. – LOS "F" AM and PM Peak Hours

Consistent with Table 6-2, the weekday AM and PM peak hour intersection LOS are summarized on Exhibit 6-8 for EAPC (2017) traffic conditions. The intersection operations analysis worksheets for EAPC (2017) conditions are included in Appendix "6.2" of this TIA. Recommended improvements necessary to bring peak hour intersection operations within acceptable levels for EAPC (2017) traffic conditions are discussed in Section 6.8 *Recommended Improvements for EAP and EAPC (2017) Conditions*.

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for EAP (2017) and EAPC (2017) traffic conditions are based on EAP (2017) and EAPC (2017) volumes, respectively.

For EAP (2017) traffic conditions, no additional intersections appear to warrant a traffic signal in addition to the intersections identified in previously under Existing (2014) and E+P traffic conditions (see Appendix "6.3").

For EAPC (2017) traffic conditions, the following additional intersection appear to warrant a traffic signal in addition to the intersections identified previously (see Appendix "6.4").

ID	Intersection Location	Jurisdiction
3	Calimesa Boulevard / Cherry Valley Boulevard	Calimesa

6.6 BASIC FREEWAY SEGMENT ANALYSIS

EAP (2017) and EAPC (2017) peak hour mainline directional volumes are provided on Exhibits 6-9 and 6-10, respectively. The Opening Year (2017) freeway analysis assumes the existing mixed-flow lanes only, and does not include any improvements that may be constructed by Caltrans at a later date. Segment analysis results for the AM and PM peak hours are summarized on Table 6-3. As shown on Table 6-3, the study area mainline segments are anticipated to operate at acceptable service levels for both EAP (2017) and EAPC (2017) traffic conditions (i.e., LOS "D" or better).

[1] Number of lanes are in the specified direction and is based on existing conditions. No future improvements are currently plannec

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln)

EAP (2017) freeway mainline level of service analysis worksheets are provided in Appendix "6.5". EAPC (2017) freeway mainline level of service analysis worksheets are provided in Appendix "6.6".

6.7 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations have been evaluated for EAP (2017) and EAPC (2017) traffic conditions at the I-10 / Cherry Valley Boulevard interchange. As shown on Table 6-4, it is anticipated that all the freeway ramp junctions are anticipated to operate projected to operate at LOS "D" or better for both EAP (2017) and EAPC (2017) traffic conditions.

The EAP (2017) freeway ramp operations analysis worksheets are provided in Appendix "6.7" and EAPC (2017) freeway ramp operations analysis worksheets are provided in Appendix "6.8".

6.8 RECOMMENDED IMPROVEMENTS FOR EAP AND EAPC (2017) CONDITIONS

6.8.1 INTERSECTIONS

Table 6-5 identifies the necessary improvements required to achieve requisite LOS standards under EAP (2017) conditions while Table 6-6 identifies the necessary improvements under EAPC (2017) conditions. It should be noted that the improvements required under EAP (2017) conditions for each intersection are consistent with those previously identified for Existing traffic conditions.

Roundabouts have been assessed as an alternative to signalization at the I-10 Freeway at Cherry Valley Boulevard interchange ramps. It is our understanding that although preliminary discussions have occurred between the City of Calimesa and Caltrans, a final design has not yet been established. As such, the effectiveness of roundabouts as an alternative to signalization in addressing deficiencies identified in this study at the I-10 Eastbound and Westbound ramps at Cherry Valley Boulevard has been based on the 2025 interim concept previously presented in the *Roundabout Feasibility Study for Interstate 10 and Cherry Valley Boulevard Interchange*. (3) As shown on Tables 6-5 and 6-6, the results of the assessment indicate that the implementation of roundabouts at the I-10 Freeway at Cherry Valley Boulevard interchange are anticipated to operate at acceptable LOS under both EAP and EAPC (2017) conditions. As mentioned in the feasibility study, the final geometric layouts of the roundabouts will require a more detailed design examination accounting stopping sight distance, intersection sight distance, entry angle and view angles and other design criteria that are typically not considered in the "preliminary roundabout concept development" process. These essential geometric considerations affect the safety and capacity performance of roundabouts.

EAP and EAPC (2017) intersection operations analysis worksheets, with improvements, are provided in Appendices "6.9" and "6.10", respectively.

6.8.2 FREEWAY OFF-RAMP QUEUING

A traffic progression analysis has been performed for the off-ramps at the I-10 Freeway at Cherry Valley Boulevard interchange to assess peak hour vehicle queues that may potentially impact the freeway mainline if spillback were to occur. Progression analysis findings are

Table 6-4

presented in Table 6-7 for the EAP (2017) and EAPC (2017) traffic conditions, with improvements analyses. As shown on Table 6-7, there are no potential queuing issues anticipated during either the AM and PM peak 95th percentile traffic flows for EAP (2017) or EAPC (2017), with improvements traffic conditions.

Worksheets for the off-ramp queuing analysis at the I-10 Freeway and Cherry Valley Boulevard interchange are provided in Appendix "6.11" for EAP (2017) and Appendix "6.12" for EAPC (2017).

6.9 MITIGATION MEASURES

While ultimate improvement plans have not yet been finalized for the I-10 interchange at Cherry Valley Boulevard, a roundabout concept is being proposed by the City of Calimesa. As timing of future improvements to the interchange are uncertain, the project applicant proposes, and Mitigation Measures 1A and 1B require, payment of the project's fair share toward the construction of the interchange improvements or, if a fair share contribution program has not been established, construction of interim improvements at the I-10 at Cherry Valley interchange to mitigate project impacts.

Mitigation Measure 1A

(c) Prior to the issuance of occupancy permits, the project applicant shall pay the project's fair share toward the construction of the new interchange at the I-10 eastbound and westbound intersections at Cherry Valley Boulevard, provided that the City of Calimesa has established a fair share contribution program for such improvements. The County shall determine whether a fair share program exists in the City of Calimesa and, if one does exist, the fair share payment due from the applicant to the City of Calimesa shall be 5.8 % at the I-10 EB ramps/Cherry Valley Boulevard and 10.6% at I-10 WB ramps/Cherry Valley Boulevard, as determined in the traffic study.

(d) If a fair share contribution program has not been established, and provided that both Caltrans and the City of Calimesa authorize construction within their respective jurisdictional control, the project applicant shall construct the following interim improvements prior to the issuance of occupancy permits:

- Install traffic signals at I-10 eastbound and westbound ramp intersections at Cherry Valley Boulevard,
- Restripe to provide eastbound and westbound left turn pockets within the existing width of the Cherry Valley Boulevard bridge,
- Add a southbound right turn lane on the off ramp at the intersection of I-10 EB ramps at Cherry Valley Boulevard, and
- Add a westbound right turn lane at the intersection of I-10 WB ramps at Cherry Valley Boulevard.

Table 6-7

			AM	PM	AM	PM	AM	PM	AM	PM
I-10 EB Ramps / Cherry Valley Bl.	SBL/T/R	1,145	202	295	Yes	Yes	470 [2]	699 [2]	Yes	Yes
I-10 WB Ramps / Cherry Valley Bl.	NBL/T/R	1,030	106	169	Yes	Yes	105	201	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Mitigation Measure 1B

(c) Prior to the issuance of occupancy permits, the project applicant shall pay the project's fair share costs to realign Calimesa Boulevard approximately 550 feet east of the I-10 westbound ramps and construct an eastbound left turn lane at the intersection of Calimesa Boulevard and Cherry Valley Boulevard, provided that the City of Calimesa has established a fair share contribution program for this intersection. The County shall determine whether a fair share program exists in the City of Calimesa and, if one does exist, the fair share payment due from the applicant to the City of Calimesa shall be 12.1%, as determined in the traffic study.

(d) If a fair share contribution program has not been established, and provided that the City of Calimesa authorizes construction within its jurisdictional control, the project applicant shall, prior to the issuance of occupancy permits:

- Realign Calimesa Boulevard approximately 550 feet east of the I-10 westbound ramps; and
- Construct an eastbound left turn lane at the intersection of Calimesa Boulevard and Cherry Valley Boulevard.

A supplemental traffic analysis to assess the interim traffic signals and other improvements at the interchange ramps, including vehicle queues and potential impact to operations of the adjacent Calimesa Boulevard at Cherry Valley Boulevard intersection is provided in *San Gorgonio Crossing Supplemental Traffic Analysis* dated June 9, 2016, prepared by Urban Crossroads.

7 HORIZON YEAR (2035) TRAFFIC ANALYSIS

This section discusses the methods used to develop Horizon Year (2035) traffic forecasts for without and with Project conditions and the resulting intersection, roadway segment and freeway mainline operations.

7.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for Horizon Year (2035) traffic conditions are consistent with those shown previously on Exhibit 3-1, with the exception of Project driveways and those facilities assumed to be constructed by the Project or cumulative development projects to provide site access are also assumed to be in place for Horizon Year (2035) conditions.

7.2 HORIZON YEAR (2035) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the County of Riverside Traffic Analysis Model (RivTAM). The volumes have been developed to assume the currently adopted roadway circulation network in the immediate vicinity of the proposed Project site. The weekday ADT volumes which can be expected for Horizon Year (2035) without Project traffic conditions are shown on Exhibit 7-1. Exhibits 7-2 and 7-3 show the AM and PM peak hour intersection turning movement volumes for Horizon Year (2035) without Project traffic conditions.

7.3 HORIZON YEAR (2035) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the RivTAM plus traffic generated by the proposed Project. The weekday ADT volumes which can be expected for Horizon Year (2035) with Project traffic conditions are shown on Exhibit 7-4. Exhibits 7-5 and 7-6 show the AM and PM peak hour intersection turning movement volumes for Horizon Year (2035) with Project traffic conditions.

7.4 INTERSECTION OPERATIONS ANALYSIS

LOS calculations were conducted for the study intersections to evaluate their peak hour operations under Horizon Year (2035) without and with Project conditions with existing roadway and intersection geometrics consistent with Exhibit 3-1. The intersection analysis results are summarized in Table 7-1 which indicates the following intersection locations will experience unacceptable LOS "E" or worse conditions during one or both of the peak hours under Horizon Year (2035) without and with Project traffic conditions:

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; d = Defacto Right Turn Lane; **1** = Improvement

[2] Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] TS = Traffic Signal; AWS = All-Way Stop; CSS = Cross-street Stop

[4] Existing intersection configuration is not applicable due to the addition of a 4th leg (Future Patton Road). Analysis of the intersection a 4 leg is shown in Table 7-4.

ID	Intersection Location
1	I-10 EB Ramps / Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
2	I-10 WB Ramps / Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
3	Calimesa Boulevard / Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
7	Union St. / Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
8	Nancy Av. / Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
9	Beaumont Av. / Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours

Consistent with Table 7-1, Horizon Year (2035) without and with Project peak hour intersection LOS are shown on Exhibits 7-7 and 7-8, respectively. The intersection operations analysis worksheets for Horizon Year (2035) without Project conditions are included in Appendix "7.1" of this TIA. The intersection operations analysis worksheets for Horizon Year (2035) with Project conditions are included in Appendix "7.2" of this TIA.

Measures to address cumulative impacts for Horizon Year (2035) traffic conditions are discussed in Section 7.8 *Recommended Improvements for Horizon Year (2035)*.

7.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

For Horizon Year (2035) without Project conditions, traffic signals appear to be warranted at the following intersections (See Appendix "7.3"):

ID	Intersection Location	Jurisdiction
3	Calimesa Boulevard / Cherry Valley Boulevard	RivCo, Calimesa
7	Union Street / Cherry Valley Boulevard	Riverside County
8	Nancy Avenue / Cherry Valley Boulevard	Riverside County

For Horizon Year (2035) with Project conditions, there are no additional traffic signals that appear to be warranted with the addition of Project traffic in comparison to those warranted under Horizon Year (2035) without Project conditions.

7.6 BASIC FREEWAY SEGMENT ANALYSIS

Horizon Year (2035) without and with Project peak hour mainline directional volumes are provided on Exhibits 7-9 and 7-10, respectively. The Horizon Year (2035) freeway analysis assumes the existing mixed-flow lanes only, and does not include any improvements that may be constructed by Caltrans at a later date. Segment analysis results for the AM and PM peak hours are summarized on Table 7-2. As shown on Table 7-2, the following study area mainline segments are anticipated to operate at unacceptable service levels for Horizon Year (2035) without and with Project conditions:

Freeway Mainline Segments
I-10 Freeway – Eastbound, east of Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
I-10 Freeway – Eastbound, west of Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
I-10 Freeway – Westbound, east of Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
I-10 Freeway – Westbound, west of Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours

Horizon Year (2035) without Project freeway mainline level of service analysis worksheets are provided in Appendix "7.4". Horizon Year (2035) with Project freeway mainline level of service analysis worksheets are provided in Appendix "7.5".

7.7 FREEWAY MERGE/DIVERGE ANALYSIS

Ramp merge and diverge operations have been evaluated for Horizon Year (2035) traffic conditions at the I-10 Freeway and Cherry Valley Boulevard interchange. As shown on Table 7-3, it is anticipated that the following ramp junctions along the I-10 Freeway are projected to operate at unacceptable service levels for both Horizon Year (2035) without and with Project conditions:

Freeway Merge/Diverge Ramp Junctions
I-10 Freeway – Eastbound, Off-Ramp at Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
I-10 Freeway – Eastbound, On-Ramp at Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
I-10 Freeway – Westbound, On-Ramp at Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours
I-10 Freeway – Westbound, Off-Ramp at Cherry Valley Boulevard – LOS "F" AM and PM Peak Hours

Horizon Year (2035) without Project freeway ramp operations analysis worksheets are provided in Appendix "7.6" and Horizon Year (2035) with Project freeway ramp operations analysis worksheets are provided in Appendix "7.7".

EXHIBIT 7-9: HORIZON YEAR (2035) WITHOUT PROJECT I-10 FREEWAY MAINLINE VOLUMES

EXHIBIT 7-10: HORIZON YEAR (2035) WITH PROJECT I-10 FREEWAY MAINLINE VOLUMES

[2] Density is measured by passenger cars per mile per lane (pc/mi/ln)

7.8 RECOMMENDED IMPROVEMENTS FOR HORIZON YEAR (2035) CONDITIONS

7.8.1 INTERSECTIONS

Improvements have been recommended at intersections that have been identified as deficient to reduce each location's peak hour delay and improve the associated LOS grade to an acceptable LOS. The effectiveness of the recommended improvements to address deficiencies for Horizon Year (2035) with Project traffic conditions are presented in Table 7-4.

Based on discussions with Caltrans District 8 staff, it is our understanding that specific improvement plans have not yet been finalized for the Cherry Valley Boulevard interchange at the I-10 Freeway. As such, an approved future interchange design at Cherry Valley Boulevard and the I-10 Freeway is currently unavailable. Based on review of this interchange conducted in the field and review of aerial imagery, the recommended improvements include lane additions and signal modifications which will require widening of the bridge (overcrossing) over the I-10 Freeway in conjunction with additional improvements to accommodate signal interconnect. The existing Cherry Valley Boulevard interchange is currently a tight-diamond interchange and improvements have been recommended to build off the existing configuration per discussion with Caltrans District 8 staff. In depth alternative interchange designs will likely be assessed as part of a future interchange study (PSR or Project Study Report) at the I-10 Freeway at Cherry Valley Boulevard interchange. As shown on Table 7-4, a preliminary assessment of a roundabout alternative for this interchange has also been included in this report. The preliminary roundabout design has been based on the 2035 ultimate roundabout concept presented in the *Roundabout Feasibility Study for Interstate 10 and Cherry Valley Boulevard Interchange*. (3) As mentioned previously, the final geometric layouts of the roundabouts will require a more detailed design examination accounting stopping sight distance, intersection sight distance, entry angle and view angles and other design criteria that are typically not considered in the "preliminary roundabout concept development" process. These essential geometric considerations affect the safety and capacity performance of roundabouts.

As shown on Table 7-4, the results of the assessment indicate that the implementation of roundabouts at the I-10 Freeway at Cherry Valley Boulevard interchange are anticipated to operate at acceptable LOS under Horizon Year (2035) with Project conditions.

Worksheets for Horizon Year (2035) without and with Project conditions, with improvements, HCM calculations are provided in Appendices "7.8" and "7.9", respectively.

7.8.2 FREEWAY OFF-RAMP QUEUING

A traffic progression analysis has been performed for the off-ramps at the I-10 Freeway at Cherry Valley Boulevard interchange to assess peak hour vehicle queues that may potentially impact the freeway mainline if spillback were to occur. Progression analysis findings are presented in Table 7-5 for Horizon Year (2035) with Project conditions, with improvements.

Table 7-4

Recommended Improvements for Horizon Year (2035) With Project Conditions

	- With Improvements	TS	1	1	d	1	1	d	1	**2**	**1>**	1	**2**	0	37.1	43.6	D	D

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS)

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; d= Defacto Right Turn Lane; >> = Free Right Turn Lane; **1** = Improvement

[2] Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (o movements sharing a single lane) are shown. The signalized I-10 ramp locations at Cherry Valley Boulevard have been analyzed using the Synchro software

[3] AWS = All-Way Stop; CSS = Cross-street Stop; TS = Traffic Signal; RA = Roundabout

[4] The roundabout concept utilized to perform this LOS assessment is preliminary and is based on the 2035 ultimate roundabout concept previously presented in the *Roundabout Feasibility Study for Interstate 10 and Cherry Valley Boulevard* Interchange published by Omni-means, Ltd. (September 2013). If a roundabout were to be selected for implementation, additional design and operational analysis consistent with both the Caltrans *Geometric Design Guidance, Final Report* (June 2007), and R*eport 672 Roundabouts: An Informational Guide (Second Edition)* published by the National Cooperative Highway Research Program (NCHRP) and the Federal Highway Administration (FHWA) will need to be performed.

Table 7-5

Peak Hour Freeway Off-Ramp Queuing Summary for Horizon Year (2035) Conditions

Intersection	Movement	Available Stacking Distance (Feet)	95th Percentile Queue (Feet)		Acceptable? [1]	
			AM	PM	AM	PM
I-10 EB Ramps / Cherry Valley Bl.	SBL/T	1,145	488 [2]	969 [2]	Yes	Yes
I-10 WB Ramps / Cherry Valley Bl.	**NBL**	**200**	311 [3]	574 [2,3]	Yes	Yes
	NBT/R	1,030	470 [2]	424	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 15 feet of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Although the 95th percentile queue length exceeds turn pocket capacity, the total queue length of the ramp is anticipated to accommodate excess turn pocket queues and is not considered to result in any deficiencies.

NBL = Improvement

As shown on Table 7-5, there are no potential queuing issues anticipated during both AM and PM peak 95th percentile traffic flows for Horizon Year (2035), with Project, with improvements, traffic conditions.

Worksheets for the off-ramp queuing analysis are provided in Appendix "7.10".

7.8.3 RECOMMENDED IMPROVEMENTS TO ADDRESS CUMULATIVE IMPACTS ON FREEWAY FACILITIES

The mainline and ramp junctions of the I-10 Freeway east and west of Cherry Valley Boulevard would operate at LOS "F" even without the Project under Horizon Year (2035) traffic conditions. In fact, the Project's contribution to cumulative impacts under Horizon Year (2035) conditions is relatively de minimis, involving only a small percentage (approximately 1% or less) of the forecasted traffic occurring on the identified freeway mainline and ramp junction under 2035 conditions.

The Riverside County Transportation Commission (RCTC) shows long range plans to add an eastbound truck climbing lane from the San Bernardino County line to SR-60. The Caltrans I-10 Route Concept Report, which is currently being updated, shows plans for adding an HOV lane (3)from San Bernardino County Line to SR-60. As the timing and funding of these future improvements are uncertain, they were not included as part of this analysis.

At this time, Caltrans has no fee programs or other mitigation programs in place for the mitigation of direct or cumulative impacts caused by development projects in Riverside County on State Highway System (SHS) roadway segments. Mitigation of cumulative impacts to freeway ramps are satisfied by mandatory participation in the TUMF program.

8 SITE ACCESS AND ON-SITE CIRCULATION

Section 8 summarizes Project site access and on-site circulation recommendations.

8.1 ON-SITE ROADWAY IMPROVEMENTS

The Project is proposed to have access on Cherry Valley Boulevard via Driveway 1, Street 2 and Driveway 3. Street 2 is proposed to be full-access. Driveways 1 and 3 will be restricted to right-in/right-out access only.

Roadway improvements necessary to provide site access and on-site circulation are assumed to be constructed in conjunction with site development and are described below. These improvements should be in place prior to occupancy.

The recommended site-adjacent roadway improvements for the Project are described below. Exhibit 8-1 illustrates the site-adjacent roadway improvement recommendations.

Cherry Valley Boulevard - Construct Cherry Valley Boulevard from the westerly Project boundary to the easterly Project boundary at its ultimate half-section width as an Arterial Highway (128-foot right-of-way) consistent with the Riverside County General Plan Circulation Element. Construct a raised median on Cherry Valley Boulevard to enforce right-in/right-out access at Driveway 1 and Driveway 3.

Street 2 - Construct Street 2 from the Project's Private Roadway to Cherry Valley Boulevard as a Public Street at its ultimate full-section width as an Industrial Collector (78-foot right-of-way).

Private Roadway - Construct Project's Private Roadway from northerly Project boundary to its connection with Street 2 as a 56-foot paved section.

Driveway 3 - Construct Driveway 3, north of Cherry Valley Boulevard, at its ultimate full-section width as an Industrial Collector (78-foot right-of-way).

Specific lane geometrics at each Project access point are discussed subsequently in *Section 8.2 Site Access Improvements*.

8.2 SITE ACCESS IMPROVEMENTS

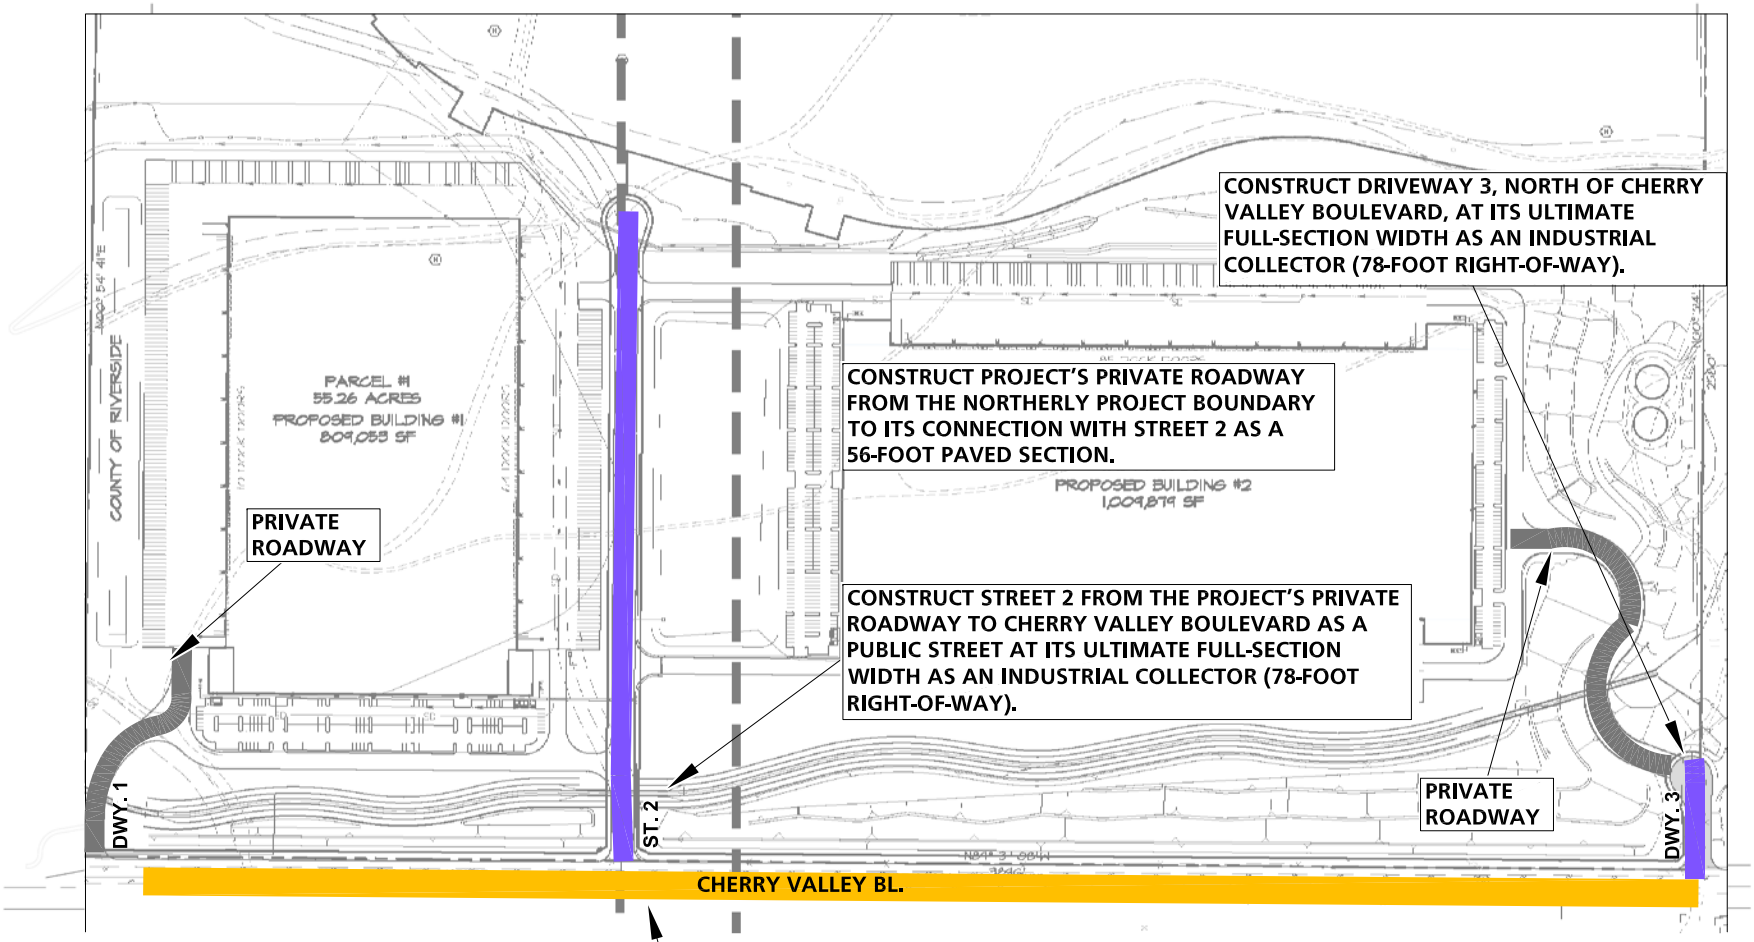
The recommended site access driveway improvements for the Project are described below. Exhibit 8-2 illustrates the on-site and the minimum site adjacent recommended roadway lane improvements. Construction of on-site and site adjacent improvements shall occur in conjunction with adjacent Project development activity or as needed for Project access purposes.

Driveway 1 at Cherry Valley Boulevard – Install a stop control on the southbound approach and construct the intersection with right-in/right-out access only in conjunction with the following geometrics:

Northbound Approach: N/A

Southbound Approach: One right turn lane.

EXHIBIT 8-1: SITE ADJACENT ROADWAY RECOMMENDATIONS

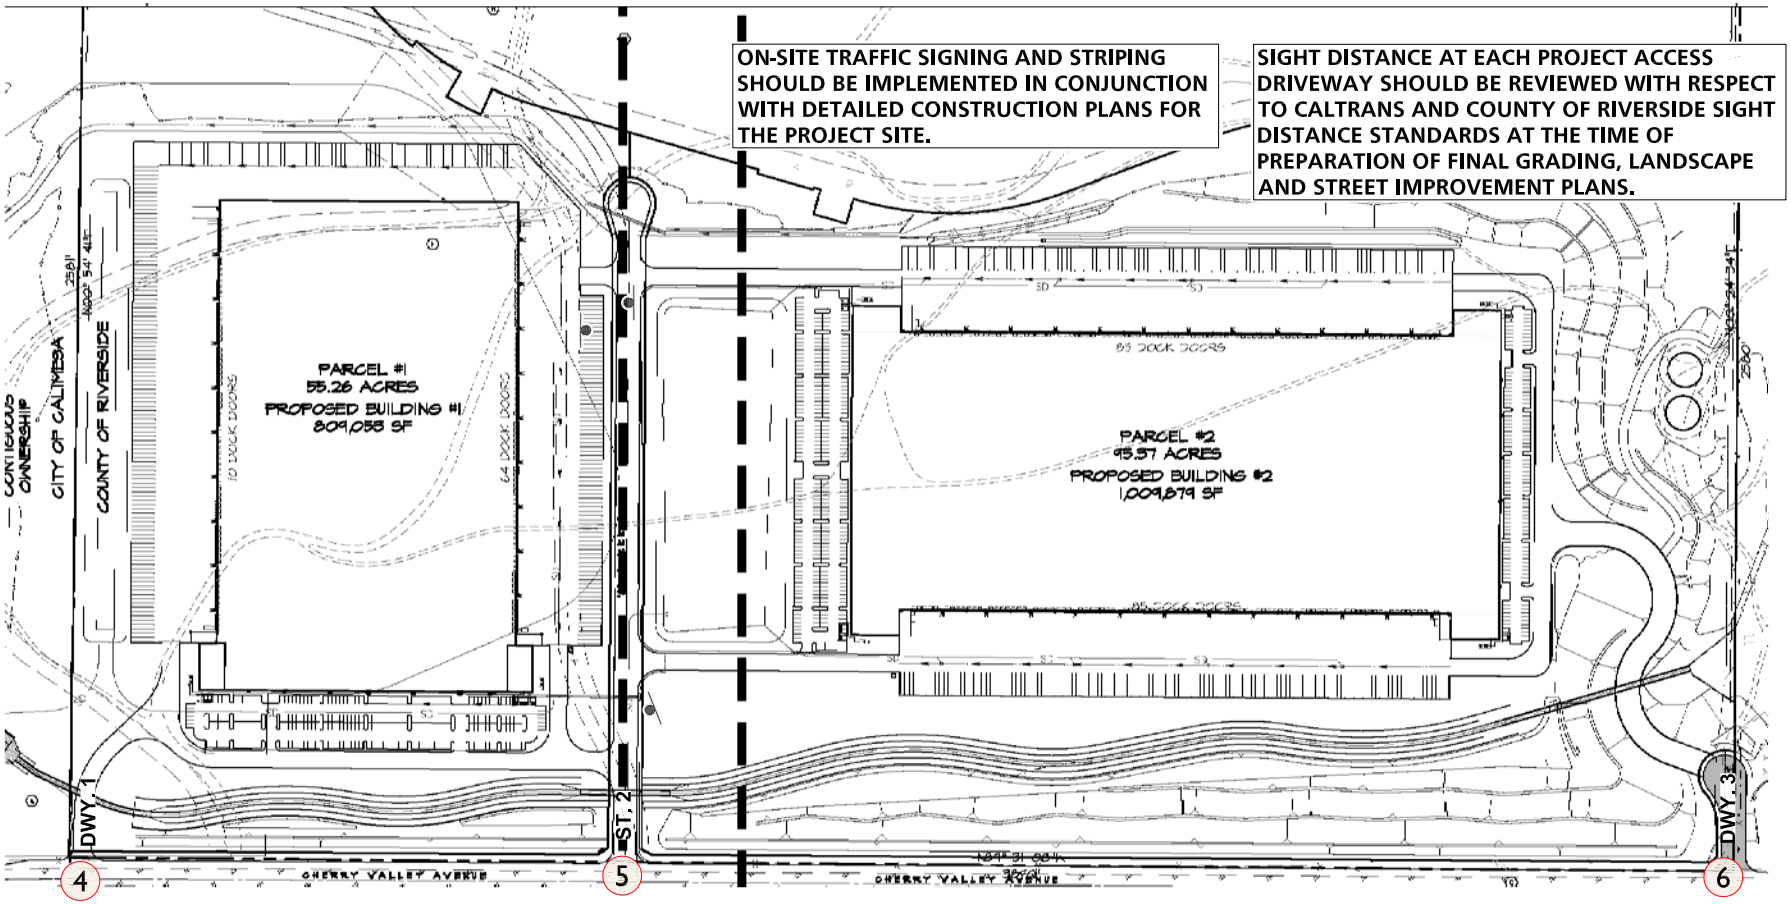


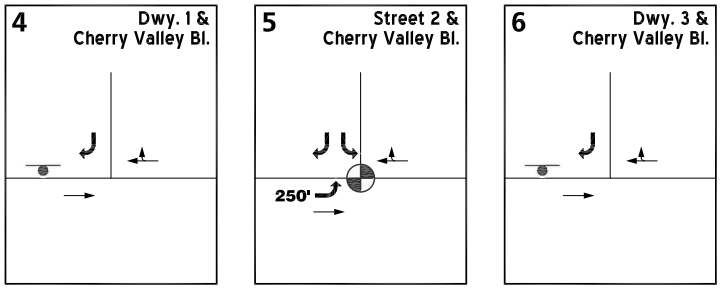
CVAR_11309

N

URBAN CROSSROADS

EXHIBIT 8-2: SITE ACCESS ON-SITE CIRCULATION RECOMMENDATIONS





LEGEND:

- = TRAFFIC SIGNAL
- = STOP SIGN
- = EXISTING LANE

URBAN CROSSROADS

Eastbound Approach: One through lane.

Westbound Approach: One shared through-right turn lane.

Street 2 at Cherry Valley Boulevard – Install a traffic signal and construct the intersection with the following geometrics:

Northbound Approach: N/A.

Southbound Approach: One left turn lane and one shared through-right turn lane.

Eastbound Approach: One left turn lane with a minimum of 250-feet of storage and one though lane. Westbound Approach: One shared through-right turn lane.

Driveway 3 at Cherry Valley Boulevard – Install a stop control on the southbound approach and construct the intersection with right-in/right-out access only in conjunction with the following geometrics:

Northbound Approach: N/A

Southbound Approach: One right turn lane.

Eastbound Approach: One through lane.

Westbound Approach: One shared through-right turn lane.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the Project site.

Sight distance at each Project access driveway should be reviewed with respect to Caltrans and County of Riverside sight distance standards at the time of preparation of final grading, landscape and street improvement plans.

8.3 ON-SITE CIRCULATION

The Project is anticipated to construct curb and gutter improvements and sidewalks along the Project frontage on Cherry Valley Boulevard. Truck turning templates should be utilized at the Project driveways to ensure that each Project access point is designed to support the ingress and egress of heavy vehicles to and from the site.

8.4 QUEUING ANALYSIS

The 95th percentile queue for the eastbound left-turn lane at intersection #5 (Street 2 and Cherry Valley Boulevard) was assessed using Synchro (version 8 Build 805). The queuing analysis was conducted for both AM and PM peak hours for EAP (2017), EAPC (2017) and Horizon Year (2035) With Project conditions. The results have been provided in Appendix "8.1". The queuing analysis shows that the 95th percentile queues are less than the 250' recommended storage length for the eastbound left-turn lane for all analysis scenarios.

9 LOCAL AND REGIONAL FUNDING MECHANISMS

Transportation improvements throughout Riverside County are funded through a combination of direct project mitigation, fair share contributions, established development impact fee programs and public funding (Measure A, state and federal gas taxes, etc.). Identification and timing of needed improvements is generally determined through local jurisdictions based upon a variety of factors. The proposed Project is located within a unique transportation improvement funding district designed to ensure timely impact mitigation with significant local control. Additional discussion of the relevant pre-existing transportation impact fee programs is provided below.

9.1 TRANSPORTATION UNIFORM MITIGATION FEE (TUMF) PROGRAM

The TUMF program is administered by Western Riverside Council of Governments (WRCOG) based upon a regional Nexus Study completed in early 2003 and updated in 2009 to address major changes in right of way acquisition and improvement cost factors. TUMF identifies a network of backbone and local roadways that are needed to accommodate growth through 2035. This regional program was put into place to ensure that development pays its fair share and that funding is in place for construction of facilities needed to maintain the requisite level of service and critical to mobility in the region. TUMF is a truly regional mitigation fee program, and is imposed and implemented in every jurisdiction in Western Riverside County except the City of Beaumont (where a locally implanted program duplicates the regional program).

TUMF fees are imposed on new residential, industrial, and commercial development through application of the TUMF fee ordinance and fees are collected at the building or occupancy permit stage.

Current TUMF rates are shown in Table 9-1. The fee for industrial use is $1.73 per square foot with an adjustment to the baseline square footage for high-cube logistics warehouse buildings. In addition, inflation adjustments are considered on an annual basis. In this way, TUMF fees are adjusted on a regular basis to ensure that the development impact fees collected keep pace with construction and labor costs, etc.

After the TUMF fees are collected, they are placed in a separate interest bearing account pursuant to the requirements of Government Code sections 66000 et seq. The TUMF funds specific local and regional projects in the arterial system. Local area projects receive about 48.7% of all funds. These local funds are programmed into five localized zones and fund the construction of eligible localized projects that are prioritized by the affected local jurisdictions within each zone. As shown in Table 1-5, a number of the facilities forecast to be cumulatively impacted by the proposed Project are programmed for improvements through the TUMF program.

The facilities planned through the TUMF program are constructed prior to the time at which the identified facility is expected to deteriorate to an inadequate level of service. WRCOG has a successful track record funding and overseeing the construction of improvements funded through the TUMF program. In total, the TUMF program is anticipated to generate nearly $5

Table 9-1

Estimated Fee Obligation

Transportation Uniform Mitigation Fee (TUMF)

FEE REFERENCE	SINGLE FAMILY RESIDENTIAL ($ PER DU)	MULTI-FAMILY ($ PER DU)	COMMERCIAL ($ PER SQ FT)	SERVICE ($ PER SQ FT)	INDUSTRIAL ($ PER SQ FT)
Transportation Uniform Mitigation Fee (TUMF)	$8,873	$6,231	$10.49	$4.19	$1.73

- All fees reflect full Nexus values

County of Riverside DIF

FEE REFERENCE	SINGLE FAMILY RESIDENTIAL ($ PER DU)	MULTI-FAMILY ($ PER DU)	COMMERCIAL[1] ($ PER ACRE)	INDUSTRIAL[1] ($ PER ACRE)	SURFACE MINING ($ PER ACRE)
DIF-Transportation - Roads, Bridges, Major Improvements	$757	$598	$2,820	$1,473	$1,296
DIF-Transportation - Signals	$420	$378	$6,971	$4,878	$4,293

Source: County of Riverside Ordinance 659

[1] Development Impact Fee (DIF) for commercial or industrial projects are based on units of developed acreage.

billion in transportation projects for Western Riverside County. The Project's contribution to TUMF appears to be sufficient to mitigate its impacts to TUMF-funded facilities.

9.2 DEVELOPMENT IMPACT FEE (DIF) PROGRAM

The study area is located within the County's San Gorgonio Pass Area and therefore will be subject to County of Riverside Development Impact Fees (DIF) in an effort by the County to mitigate development throughout its unincorporated area. The DIF program consists of two separate transportation components: Roads, Bridges and Major Improvements component and the Traffic Signals component. Eligible facilities for funding by the County DIF program are identified on the County's Public Needs List, which currently extends through the year 2010. A comprehensive review of the DIF program is now planned in order to update the nexus study. Table 9-1 shows the current fee schedule for the County's DIF program.

The cost of signalizing DIF network intersections is identified under the Traffic Signals component of the DIF program. County staff generally defines DIF eligible intersections as those consisting of two intersecting general plan roadways. If the intersection meets this requirement, it is potentially eligible for up to $235,000 of credit, which is subject to negotiations with the County.

9.3 MEASURE "A" FUNDS

In 1988, the voters of Riverside County approved Measure "A", a half cent sales tax for transportation projects including, but not limited to, infrastructure improvements, commuter public transit, and other identified improvements. Between 1989 and 2009, the Riverside County Transportation Commission has spent over One Billion Dollars raised by Measure "A" on identified roadway and transportation improvements. Funds are allocated to each of three districts: Western Riverside County, the Coachella Valley, and Palo Verde area in proportion to the amount of sales tax generated within each sub-region. In 2002, Measure "A" was extended by Riverside County voters and will continue to fund numerous transportation improvements through the year 2039. Programs like Measure "A" have been adopted in both San Bernardino and Orange County.

While Measure "A" is a self-executing sales tax administered by the Riverside County Transportation Commission (as opposed to a fee mitigation program imposed upon individual products) Measure "A" bears discussion here because the funds raised through Measure "A" have funded in the past and will continue to fund (in addition to the three identified mitigation programs discussed above) new transportation facilities in Riverside County. The Riverside County Transportation Commission has successfully implemented numerous projects that have been funded by Measure "A" and Measure "A" will continue to fund additional projects in the future.

9.4 FAIR SHARE CONTRIBUTION

Project mitigation may include a combination of fee payments to established programs, construction of specific improvements, payment of a fair share contribution toward future improvements or a combination of these approaches. Intersection improvements not included

in impact fee programs have been previously presented in Table 1-5. Improvements constructed by development may be eligible for a fee credit or reimbursement through established program where appropriate.

When off-site improvements are identified with a minor share of responsibility assigned to proposed development, the approving jurisdiction may elect to collect a fair share contribution or require the development to construct improvements. Detailed fair share calculations for each peak hour have been provided on Table 9-2 for the study area intersections.

A rough order of magnitude cost should be prepared to determine the appropriate contribution value based upon the project's fair share of traffic as part of the project approval process. The cost basis should be determined by the County based upon physical and community constraints, current bidding experiences and engineering preferences.

Table 9-2

Project Fair Share Calculations at Study Area Intersections

#	Intersection		Existing	Project	Year 2035 WP	Total New Traffic	Project % of New[1]

COUNTY OF RIVERSIDE TRANSPORTATION DEPARTMENT
4080 Lemon Street, 8th Floor
Riverside, CA 92501

Subject: Traffic Impact Analysis Scoping Agreement for the Proposed I-10 Gateway Job Center (Parcel Map No. 36093)

The firm of Urban Crossroads, Inc. is pleased to submit this scoping letter regarding the traffic impact analysis for the proposed I-10 Gateway Job Center (Parcel Map No. 36093) ("Project"), which is generally located north of Cherry Valley Boulevard and approximately 1,800 feet east of the I-10/Cherry Valley Boulevard interchange in unincorporated County of Riverside. The Project includes the development of 2,560,000 square feet of high-cube logistics warehouse use between two (2) buildings. The proposed intensity for each of the buildings is listed below:

- Building 1 – 960,000 square feet of high-cube warehouse use with access to Cherry Valley Boulevard via Driveway 1 and Driveway 2.
- Building 2 – 1,600,000 square feet of high-cube warehouse use with access to Cherry Valley Boulevard via Driveway 2 and Driveway 3.

A preliminary land use plan for the proposed Project is shown on Exhibit 1. Exhibit 2 depicts the location of the proposed project in relation to the existing roadway network. It is anticipated that the Project would be developed within a single phase. The Project's opening year is anticipated to be 2014 (i.e., fully built and occupied). Access to the project site will be provided via Driveway 1, Driveway 2 and Driveway 3 to Cherry Valley Boulevard. Right-in/right-out access only is proposed at Driveway 1 and Driveway 3, with full access at Driveway 2.

Dwy 1 & 3: RIRO
Dwy 2: Full-access

TRIP GENERATION

In order to develop the traffic characteristics of the proposed project, trip-generation statistics published in the Institute of Transportation Engineers (ITE) Trip Generation (9th Edition, 2012) manual for the proposed land use (ITE Land Use Code 152 – High-Cube Warehousing) was used. This particular rate was selected based on our understanding of the Project's operating characteristics. Trip generation rates for the Project are shown in Table 1. Refinements to these raw trip generation estimates have been made to provide a more

detailed breakdown of trips by vehicle mix. Per County of Riverside standard practice, vehicle mix percentages were obtained from the City of Fontana *Truck Trip Generation Study* (August 2003), a recognized source throughout the County of Riverside and the County of San Bernardino for estimating the vehicle mix associated with industrial and warehouse uses. Although ITE provides truck trip generation information for the high-cube logistics warehouse use, this data is not considered as comprehensive as the data available in the Fontana Study nor is it specific to large warehouses/distribution centers in Southern California. As such, the vehicle-mix for the Fontana land use code 150 for Heavy Warehouse has been applied to ITE trip generation rates for land use code 152.

Finally, Passenger Car Equivalents (PCE) factors have been applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCE factors have been utilized due to the expected heavy truck component for the proposed Project uses. PCE factors allow the typical "real-world" mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, for the purposes of capacity and level of service analyses. PCE factors are applied to large truck types such as large two-axles, three-axles, 4+-axles. A PCE factor of 1.5 has been applied to large 2-axle trucks, a factor of 2.0 for 3-axle trucks and a factor of 3.0 for 4+-axle trucks. These PCE factors are consistent with the values recommended by the San Bernardino Associated Governments (SANBAG) and are accepted factors in the County of Riverside.

As shown in Table 1, the proposed Project is anticipated to generate a net total of approximately 5,635 PCE based trip-ends per day with 369 PCE based AM peak hour trips and 403 PCE based PM peak hour trips.

TRIP DISTRIBUTION

The Project passenger car trip distribution pattern is graphically depicted on Exhibit 3. The Project truck trip distribution pattern is graphically depicted on Exhibit 4.

ANALYSIS SCENARIOS

Consistent with the County's TIA guidelines, intersection analysis will be provided for the following analysis scenarios:

- Existing (2012) Conditions
- Existing plus Project Conditions – For Informational Purposes Only
- Existing plus Ambient Growth plus Project Conditions
- Existing plus Ambient Growth plus Project Plus Cumulative Projects
- Horizon Year (2035) Without Project Conditions
- Horizon Year (2035) With Project Conditions

The signalized study area intersections located along the Cherry Valley Boulevard (at the I-10 Freeway) will be analyzed using the SYNCHRO (Version 8.0) software consistent with Caltrans requirements.

In addition, the traffic impact analysis will include Basic Freeway Segment, Ramp Junction (Merge/Diverge) and ramp queuing analyses consistent with Caltrans requirements.

OPEN ITEMS – CUMULATIVE DEVELOPMENT PROJECTS

Please provide a list of cumulative development projects that should be included as part of this analysis along with the preferred absorption percentage for the Project's proposed opening year.

If you have any questions, please contact me directly at (949) 660-1994, extension 204.

Respectfully submitted,

Aric Evatt, PTP
Principal

JN:08312-02 Scope

Notes

* HCM 2010 computational engine requires equal clearance times for the phases crossing the barrier.

APPENDIX 3.3:

EXISTING (2014) CONDITIONS TRAFFIC SIGNAL WARRANT ANALYSIS WORKSHEETS

This page is intentionally left blank

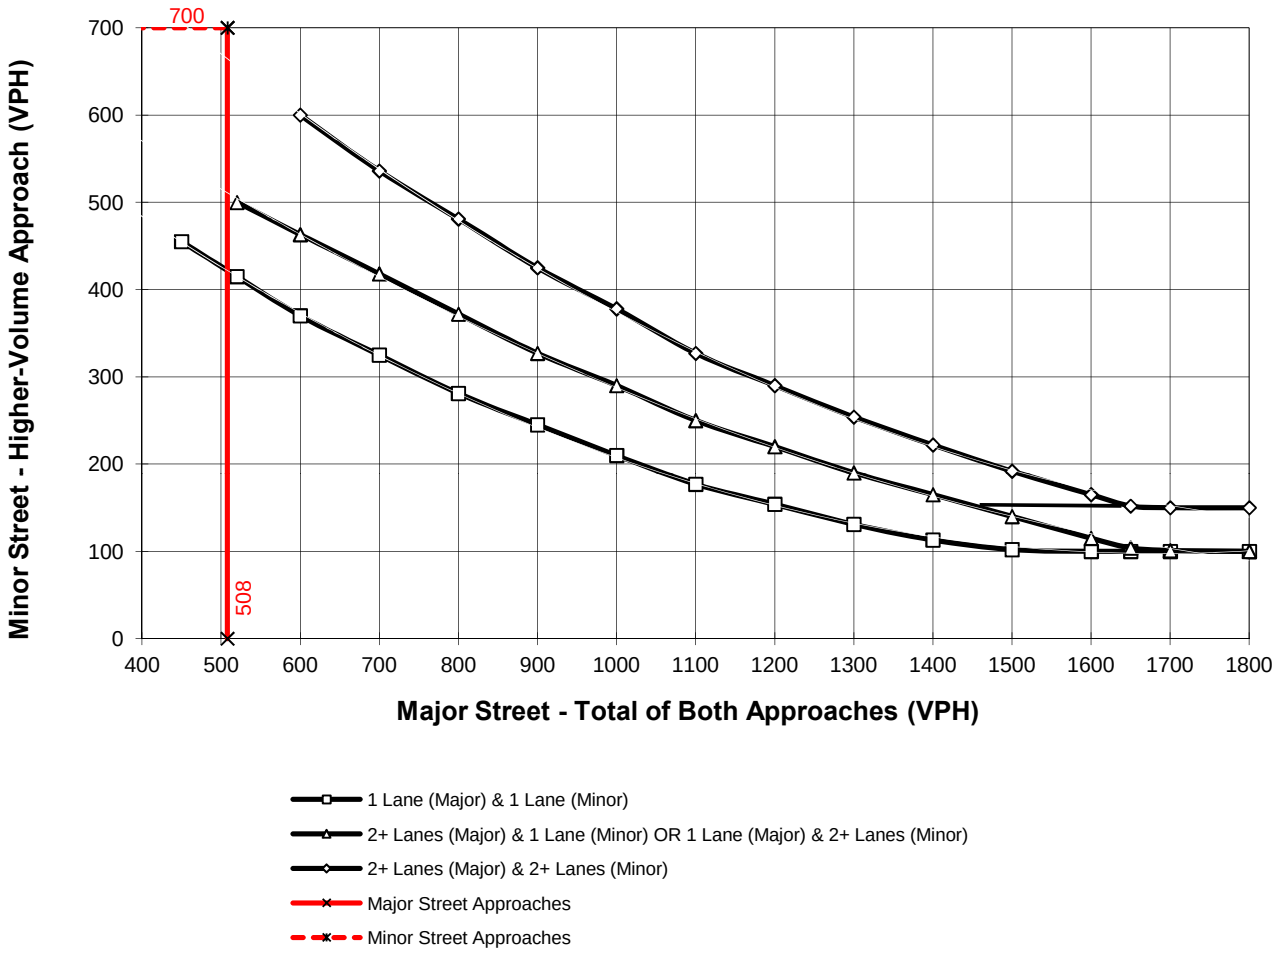
Figure 4C-3. Warrant 3, Peak Hour

Traffic Conditions = **Existing (2014) Conditions - Weekday PM Peak Hour**

Major Street Name = **Cherry Valley Boulevard** Total of Both Approaches (VPH) = **508**
Number of Approach Lanes on Major Street = **1**

Minor Street Name = **I-10 EB Ramps** High Volume Approach (VPH) = **768**
Number of Approach Lanes On Minor Street = **1**

WARRANTED FOR A SIGNAL



*Note: 150 vph applies as the lower threshold for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold for a minor-street approach with one lane

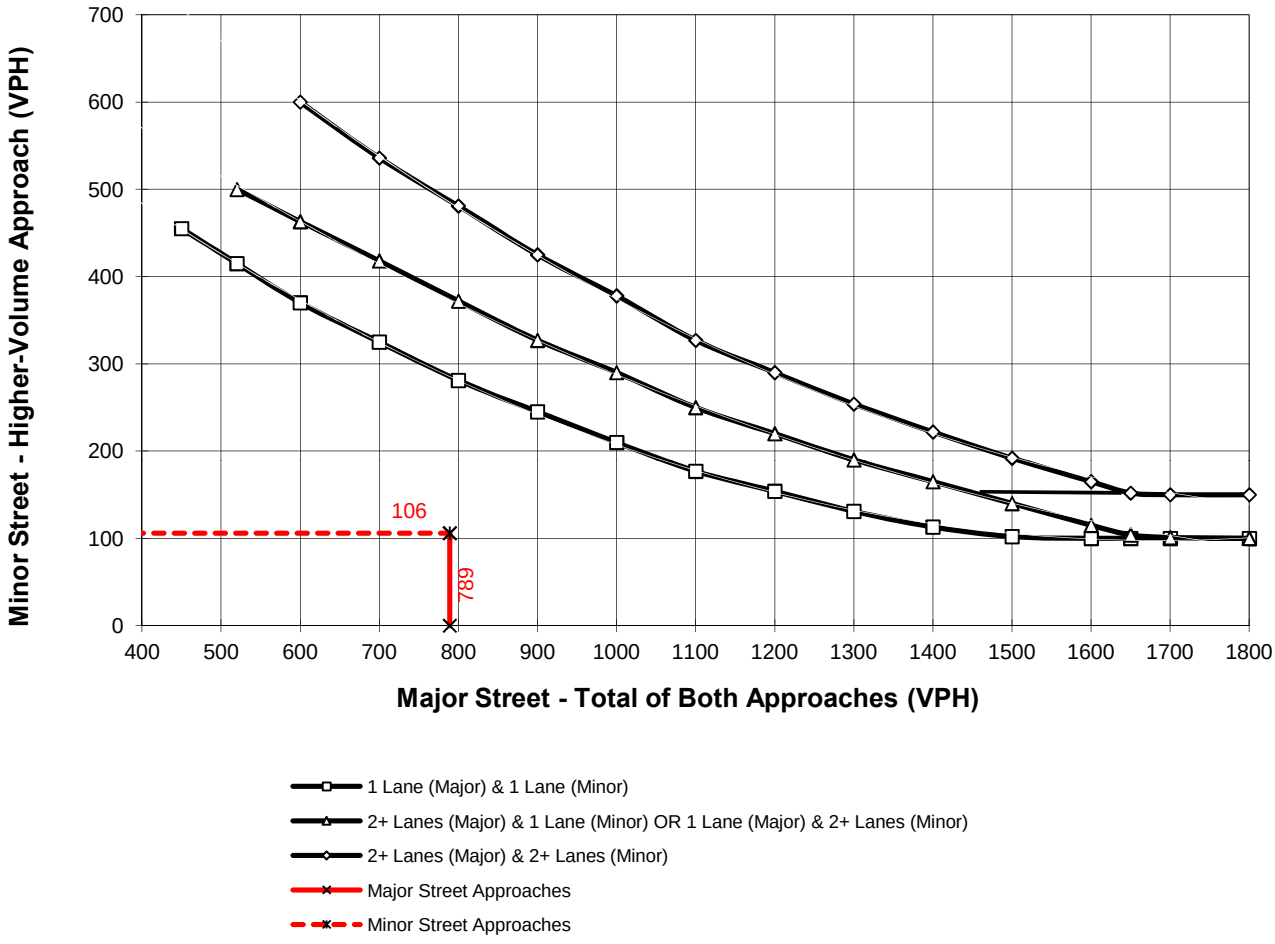
Figure 4C-3. Warrant 3, Peak Hour

Traffic Conditions = **Existing (2014) Conditions - Weekday PM Peak Hour**

Major Street Name = **Cherry Valley Boulevard** Total of Both Approaches (VPH) = **789**
Number of Approach Lanes on Major Street = **1**

Minor Street Name = **I-10 WB Ramps** High Volume Approach (VPH) = **106**
Number of Approach Lanes On Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 150 vph applies as the lower threshold for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

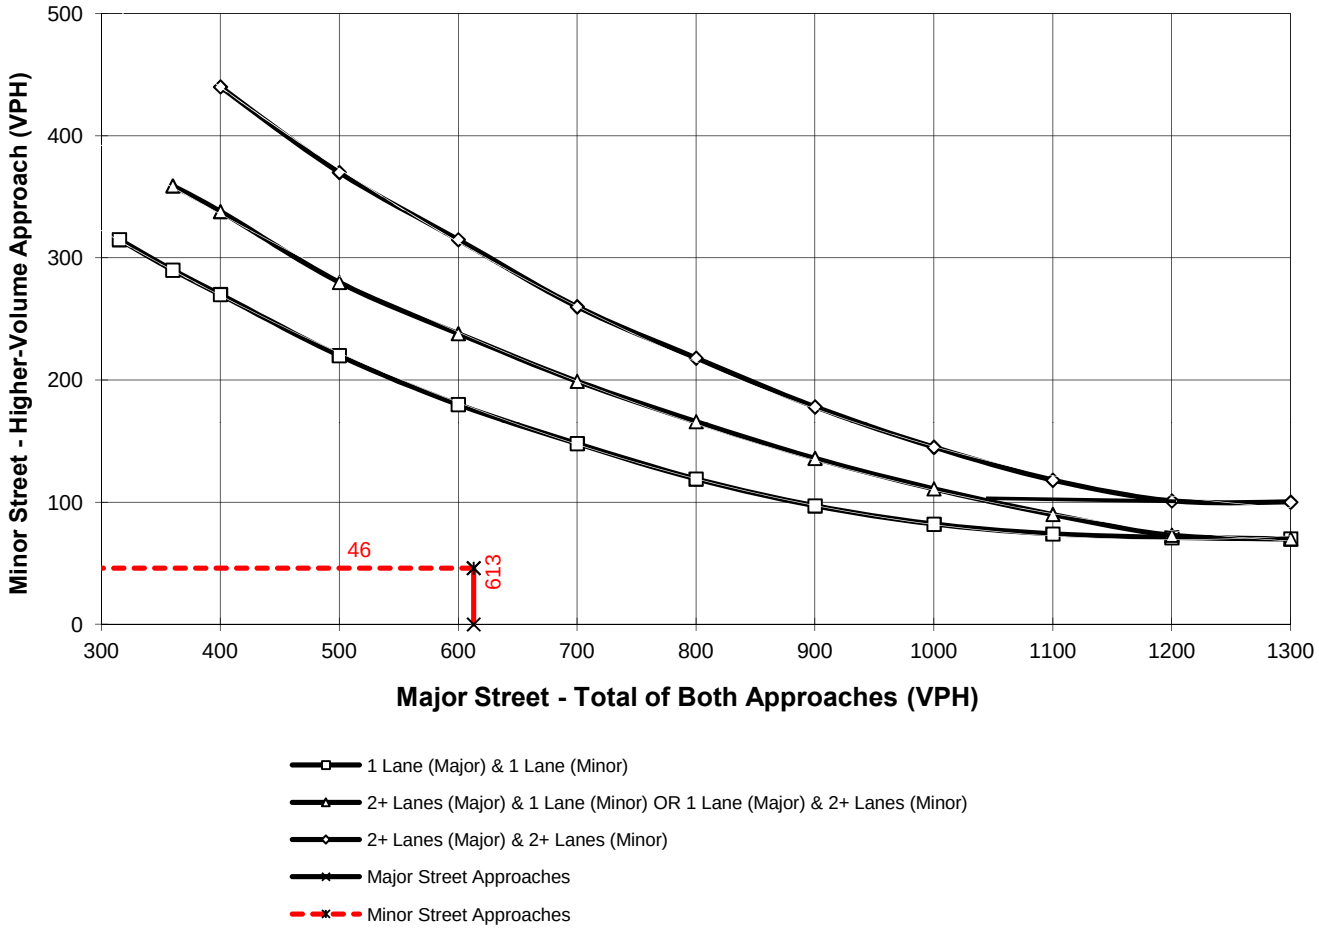
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2014) Conditions - Weekday PM Peak Hour**

Major Street Name = **Cherry Valley Boulevard** Total of Both Approaches (VPH) = **613**
Number of Approach Lanes Major Street = **1**

Minor Street Name = **Calimesa Boulevard** High Volume Approach (VPH) = **46**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

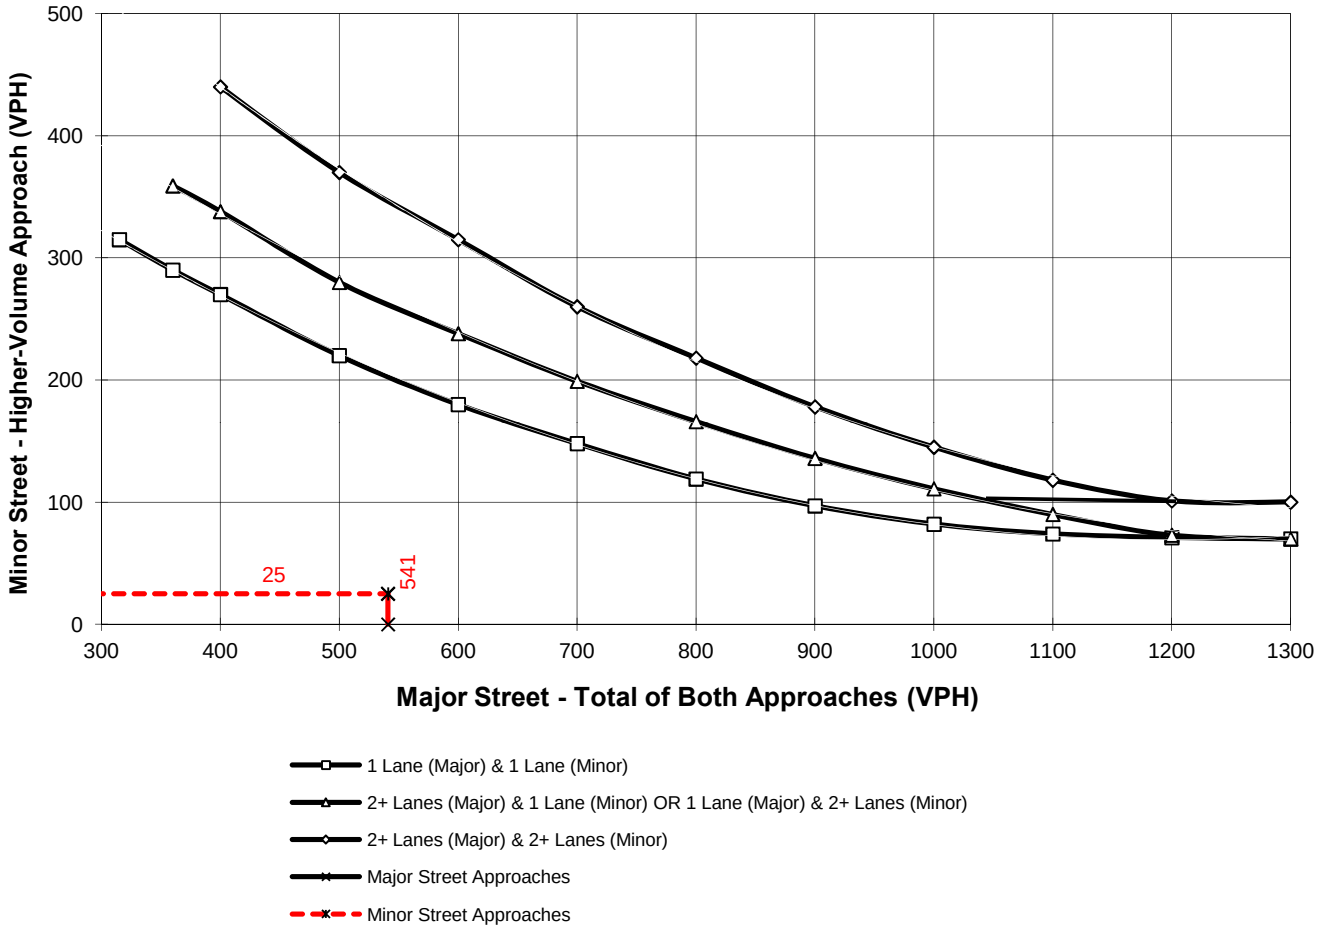
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2014) Conditions - Weekday PM Peak Hour**

Major Street Name = **Cherry Valley Boulevard** Total of Both Approaches (VPH) = **541**
Number of Approach Lanes Major Street = **1**

Minor Street Name = **Union Street** High Volume Approach (VPH) = **25**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Figure 4C-4. Warrant 3, Peak Hour (70% Factor)

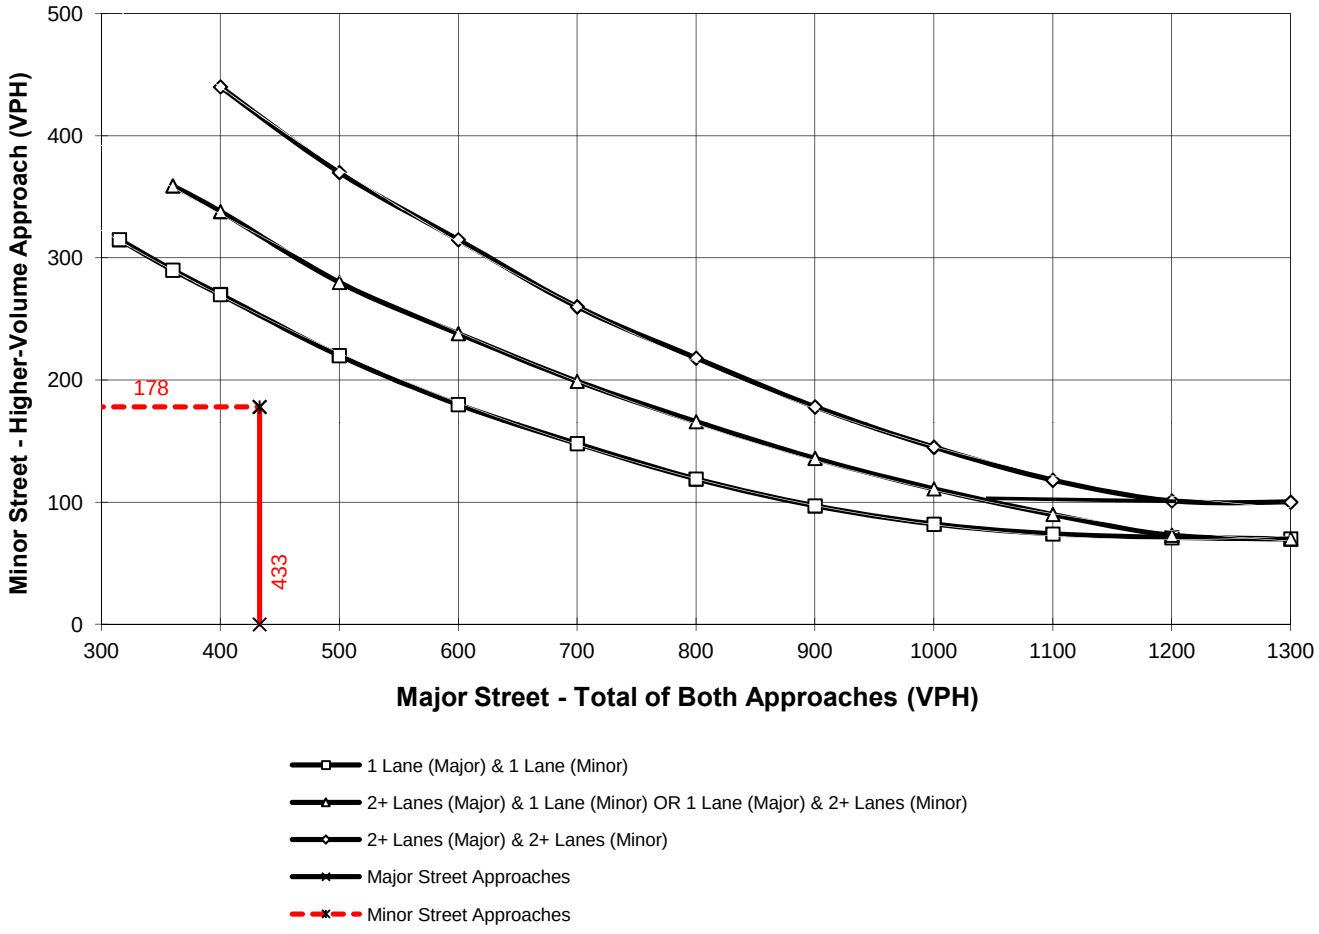
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 64 km/h OR ABOVE 40 mph ON MAJOR STREET)

Traffic Conditions = **Existing (2014) Conditions - Weekday AM Peak Hour**

Major Street Name = **Cherry Valley Boulevard** Total of Both Approaches (VPH) = **433**
Number of Approach Lanes Major Street = **1**

Minor Street Name = **Nancy Street** High Volume Approach (VPH) = **178**
Number of Approach Lanes Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 100 vph applies as the lower threshold for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold for a minor-street approach with one lane

Notes

* HCM 2010 computational engine requires equal clearance times for the phases crossing the barrier.

APPENDIX 5.2:

EXISTING PLUS PROJECT CONDITIONS TRAFFIC SIGNAL WARRANT ANALYSIS WORKSHEETS

This page is intentionally left blank

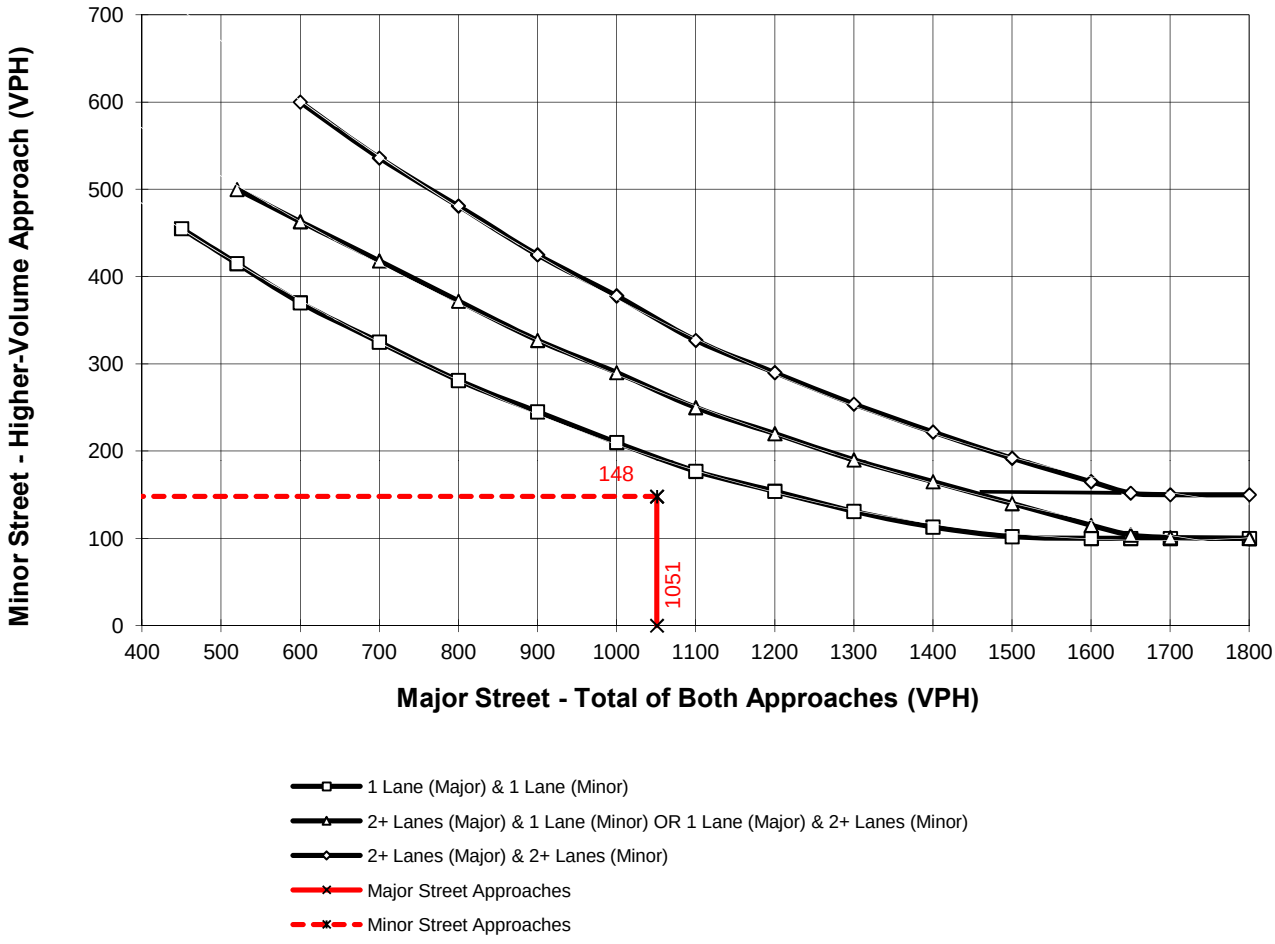
Figure 4C-3. Warrant 3, Peak Hour

Traffic Conditions = **Existing plus Project Conditions - Weekday PM Peak Hour**

Major Street Name = **Cherry Valley Boulevard** Total of Both Approaches (VPH) = **1051**
Number of Approach Lanes on Major Street = **1**

Minor Street Name = **I-10 WB Ramps** High Volume Approach (VPH) = **148**
Number of Approach Lanes On Minor Street = **1**

SIGNAL WARRANT NOT SATISFIED



*Note: 150 vph applies as the lower threshold for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold for a minor-street approach with one lane

RAMPS AND RAMP JUNCTIONS WORKSHEET

General Information / Site Information

Analyst	DL	Freeway/Dir of Travel	I-10 Eastbound
Agency or Company	Urban Crossroads, Inc.	Junction	On-Ramp at Cherry Valley
Date Performed	9/10/14	Jurisdiction	Caltrans
Analysis Time Period	PM Peak Hour	Analysis Year	Existing plus Project

Project Description I-10 Gateway Job Center (PM 36093) TIA (JN: 08312)

Inputs

Upstream Adj Ramp		Freeway Number of Lanes, N	3	Downstream Adj Ramp	
☑ Yes	☐ On	Ramp Number of Lanes, N	1	☐ Yes	☐ On
☐ No	☑ Off	Acceleration Lane Length, L_A	410	☑ No	☐ Off
L_{up} =	1660 ft	Deceleration Lane Length L_D		L_{down} =	ft
V_u =	761 veh/h	Freeway Volume, V_F	2520	V_D =	veh/h
		Ramp Volume, V_R	131		
		Freeway Free-Flow Speed, S_{FF}	65.0		
		Ramp Free-Flow Speed, S_{FR}	45.0		

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	2520	0.92	Level	13	0	0.939	1.00	2917
Ramp	131	0.92	Level	18	0	0.917	1.00	155
UpStream	761	0.92	Level	2	0	0.990	1.00	835
DownStream								

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = 790.85 (Equation 13-6 or 13-7)

P_{FM} = 0.589 using Equation (Exhibit 13-6)

V_{12} = 1718 pc/h

V_3 or V_{av34} 1199 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes,V_{12a} = 1718 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}	3072	Exhibit 13-8		No

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}	1873	Exhibit 13-8	4600:All	No

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = 17.4 (pc/mi/ln)

LOS = B (Exhibit 13-2)

Speed Determination

M_S = 0.309 (Exibit 13-11)

S_R= 57.9 mph (Exhibit 13-11)

S_0= 62.5 mph (Exhibit 13-11)

S = 59.6 mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F		Exhibit 13-8		
$V_{FO} = V_F - V_R$		Exhibit 13-8		
V_R		Exhibit 13-10		

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

D_s = (Exhibit 13-12)

S_R= mph (Exhibit 13-12)

S_0= mph (Exhibit 13-12)

S = mph (Exhibit 13-13)

UpStream								
DownStream	111	0.92	Level	8	0	0.962	1.00	125

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = using Equation (Exhibit 13-6)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)

S_R= mph (Exhibit 13-11)

S_0= mph (Exhibit 13-11)

S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.673 using Equation (Exhibit 13-7)

V_{12} = 1990 pc/h

V_3 or V_{av34} 784 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☑ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☑ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	2774	Exhibit 13-8	7050	No
$V_{FO} = V_F - V_R$	2399	Exhibit 13-8	7050	No
V_R	375	Exhibit 13-10	2100	No

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}	1990	Exhibit 13-8	4400:All	No

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = 16.3 (pc/mi/ln)

LOS = B (Exhibit 13-2)

Speed Determination

D_s = 0.332 (Exhibit 13-12)

S_R= 57.4 mph (Exhibit 13-12)

S_0= 71.3 mph (Exhibit 13-12)

S = 60.7 mph (Exhibit 13-13)

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Approach	711	0.0		0.288		1.6	LOS A	0.0	0.0				
Intersection	1361	0.0		0.311		2.2	LOS A	1.5	37.2				

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Project Description I-10 Gateway Job Center (PM 36093) TIA (JN: 08312)

Inputs

Upstream Adj Ramp
☐ Yes ☐ On
☑ No ☐ Off
L_{up} = ft
V_u = veh/h

Freeway Number of Lanes, N	3
Ramp Number of Lanes, N	1
Acceleration Lane Length, L_A	
Deceleration Lane Length L_D	565
Freeway Volume, V_F	6741
Ramp Volume, V_R	797
Freeway Free-Flow Speed, S_{FF}	65.0
Ramp Free-Flow Speed, S_{FR}	45.0

Downstream Adj Ramp
☑ Yes ☑ On
☐ No ☐ Off
L_{down} = 1660 ft
V_D = 392 veh/h

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	6741	0.92	Level	11	0	0.948	1.00	7730
Ramp	797	0.92	Level	1	0	0.995	1.00	871
UpStream								
DownStream	392	0.92	Level	1	0	0.995	1.00	428

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)
P_{FM} = using Equation (Exhibit 13-6)
V_{12} = pc/h
V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)
Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No
Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No
If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)
LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)
S_R= mph (Exhibit 13-11)
S_0= mph (Exhibit 13-11)
S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)
P_{FD} = 0.527 using Equation (Exhibit 13-7)
V_{12} = 4484 pc/h
V_3 or V_{av34} 3246 pc/h (Equation 13-14 or 13-17)
Is V_3 or V_{av34} > 2,700 pc/h? ☑ Yes ☐ No
Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☑ No
If Yes,V_{12a} = 5030 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	7730	Exhibit 13-8	7050	Yes
$V_{FO} = V_F - V_R$	6859	Exhibit 13-8	7050	No
V_R	871	Exhibit 13-10	2100	No

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}	4484	Exhibit 13-8	4400:All	Yes

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = 42.4 (pc/mi/ln)
LOS = F (Exhibit 13-2)

Speed Determination

D_s = 0.376 (Exhibit 13-12)
S_R= 56.3 mph (Exhibit 13-12)
S_0= 64.7 mph (Exhibit 13-12)
S = 59.0 mph (Exhibit 13-13)

V_{12} = 5796 pc/h

V_3 or V_{av34} 5318 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☑ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes, V_{12a} = 8414 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}	12516	Exhibit 13-8		Yes

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}	9816	Exhibit 13-8	4600:All	Yes

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = 78.3 (pc/mi/ln)

LOS = F (Exhibit 13-2)

Speed Determination

M_S = 71.742 (Exibit 13-11)

S_R = -1585.1 mph (Exhibit 13-11)

S_0 = 56.1 mph (Exhibit 13-11)

S = 298.3 mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes, V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F		Exhibit 13-8		
$V_{FO} = V_F - V_R$		Exhibit 13-8		
V_R		Exhibit 13-10		

Flow Entering Diverge Influence Area

	Actual	Max Desirable		Violation?
V_{12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 4.252 + 0.0086\ V_{12} - 0.009\ L_D$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

D_s = (Exhibit 13-12)

S_R = mph (Exhibit 13-12)

S_0 = mph (Exhibit 13-12)

S = mph (Exhibit 13-13)

RAMPS AND RAMP JUNCTIONS WORKSHEET

General Information / Site Information

Analyst	DL	Freeway/Dir of Travel	I-10 Westbound
Agency or Company	Urban Crossroads, Inc.	Junction	Off-Ramp at Cherry Valley
Date Performed	9/10/14	Jurisdiction	Caltrans
Analysis Time Period	PM Peak Hour	Analysis Year	2035 With Project

Project Description I-10 Gateway Job Center (PM 36093) TIA (JN: 08312)

Inputs

Upstream Adj Ramp		Freeway Number of Lanes, N	3	Downstream Adj Ramp	
☐ Yes	☐ On	Ramp Number of Lanes, N	1	☑ Yes	☑ On
☑ No	☐ Off	Acceleration Lane Length, L_A		☐ No	☐ Off
L_{up} =	ft	Deceleration Lane Length L_D	535	L_{down} =	1745 ft
V_u =	veh/h	Freeway Volume, V_F	10496	V_D =	1271 veh/h
		Ramp Volume, V_R	895		
		Freeway Free-Flow Speed, S_{FF}	65.0		
		Ramp Free-Flow Speed, S_{FR}	45.0		

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	10496	0.92	Level	12	0	0.943	1.00	12093
Ramp	895	0.92	Level	2	0	0.990	1.00	983
UpStream								
DownStream	1271	0.92	Level	3	0	0.985	1.00	1402

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$

L_{EQ} = (Equation 13-6 or 13-7)

P_{FM} = using Equation (Exhibit 13-6)

V_{12} = pc/h

V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

	Actual	Max Desirable		Violation?
V_{R12}		Exhibit 13-8		

Level of Service Determination (if not F)

$D_R = 5.475 + 0.00734\ v_R + 0.0078\ V_{12} - 0.00627\ L_A$

D_R = (pc/mi/ln)

LOS = (Exhibit 13-2)

Speed Determination

M_S = (Exibit 13-11)

S_R= mph (Exhibit 13-11)

S_0= mph (Exhibit 13-11)

S = mph (Exhibit 13-13)

Diverge Areas

Estimation of v_{12}

$V_{12} = V_R + (V_F - V_R)P_{FD}$

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.412 using Equation (Exhibit 13-7)

V_{12} = 5565 pc/h

V_3 or V_{av34} 6528 pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☑ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☑ Yes ☐ No

If Yes,V_{12a} = 9393 pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_F	12093	Exhibit 13-8	7050	Yes
$V_{FO} = V_F - V_R$	11110	Exhibit 13-8	7050	Yes

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

5 Lane under-utilisation found by the program
d Dominant lane on roundabout approach

Level of Service (LOS) Method: Delay & v/c (HCM 2010).
Roundabout LOS Method: Same as Signalised Intersections.
Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.
LOS F will result if v/c > irrespective of lane delay value (does not apply for approaches and intersection).
Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 2010).
Roundabout Capacity Model: SIDRA Standard.
SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

November 5, 2014

Mr. Brian Rupp
TSG Cherry Valley, L.P.
2 Park Plaza, Suite 700
Irvine, CA 92614

SUBJECT: SAN GORGONIO CROSSING TRAFFIC IMPACT ANALYSIS – SUPPLEMENTAL EXPANDED FREEWAY SEGMENT ANALYSIS

Dear Mr. Rupp:

This letter serves as a supplement to the *San Gorgonio Crossing (Parcel Map No.36093) Traffic Impact Analysis* (November 5, 2014) (referred to as "Traffic Study") that assesses freeway mainline segments for the following scenarios found in the Traffic Study:

- Existing (2014) Conditions
- Existing plus Project Conditions
- Opening Year Cumulative (2017) Without Project Conditions
- Opening Year Cumulative (2017) With Project Conditions
- Horizon Year (2035) Without Project Conditions
- Horizon Year (2035) With Project Conditions

Pursuant to recent clarification from Caltrans, study area mainline segments were selected based on the Project's contribution of 50 or more peak hour trips on a segment, which is a wider study area than the I-10 segments east and west of Cherry Valley Boulevard that were studied in the Project's Traffic Study.

SUMMARY OF FINDINGS

The addition of truck and passenger car traffic associated with the development of the proposed Project is not anticipated to result in any additional freeway segment deficiencies in addition to those identified for Existing, Opening Year Cumulative (2017) Without Project, and Horizon Year (2035) Without Project traffic conditions (see Tables 3, 4, and 5 of this report). Long-term forecasted traffic growth representative of Horizon Year (2035) traffic conditions along the I-10 and SR-60 Freeways are anticipated to exceed interim year planned improvements (Caltrans and San Bernardino Associated Governments' (SANBAG) I-10 Corridor Project, etc.), and would thus result in a deficient level of service (LOS) under Horizon Year (2035) traffic conditions (see Table 5 attached to this report).

INTRODUCTION

The *Caltrans Guide for the Preparation of Traffic Impact Studies* (December 2002) provides guidance for conditions in which the assessment of a state highway facility (SHF) is warranted. However, Caltrans has recently clarified the intent of their traffic study guidelines in a letter to the County of Riverside, and have further defined the scope of study for State Highway facilities in CEQA documents. By indicating that the analysis of freeway segments is likely warranted where a project is anticipated to contribute 50 or more peak hour trips, but also recognizes that a project's contribution to freeway segments dissipates with distance from the point of entry onto the State Highway System (SHS). The proposed San Gorgonio Crossing Project (referred to as "Project") is anticipated to contribute 50 or more peak hour trips to portions of the I-10 Freeway between the I-215 Freeway and the SR-60 Freeway and the SR-60 Freeway between the I-215 Freeway and I-10 Freeway. As the proposed Project is not anticipated to contribute 50 or more peak hour trips west of the I-215 Freeway on either the SR-60 or I-10 Freeways, or east of the SR-60 and I-10 Freeway interchange, these segments have not been included for the purposes of this analysis and are not required to be included by Caltrans. The following freeway segments are included in this supplemental analysis:

TABLE 1: BASIC FREEWAY SEGMENT ANALYSIS LOCATIONS

ID	Freeway	Direction	Segment
1	I-10	Westbound	I-215 Freeway to Waterman Av.
2	I-10	Westbound	Waterman Av. to Tippecanoe Av.
3	I-10	Westbound	Tippecanoe Av. to Mountain View Av.
4	I-10	Westbound	Mountain View Av. to California St.
5	I-10	Westbound	California St. to Alabama St.
6	I-10	Westbound	Alabama St. to Orange St.
7	I-10	Westbound	Orange St. to Cypress Av.
8	I-10	Westbound	Cypress Av. to Ford St.

56	SR-60	Eastbound	Jack Rabbit Tr. to I-10 Freeway

REGIONAL GOODS MOVEMENT

The Southern California Association of Governments (SCAG) is a regional agency established pursuant to California Government Code §6500, also referred to as the Joint Powers Authority law. On April 4, 2012, SCAG adopted the 2012-2035 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS) with goals to: 1) maximize mobility and accessibility for all people and goods in the region; 2) ensure travel safety and reliability for all people and goods in the region; 3) preserve and ensure a sustainable transportation system; 4) maximize productivity of the transportation system; 5) protect the environment, improve air quality, and promote energy efficiency; 6) encourage land use and growth patterns that complement the transportation investments and improve the cost-effectiveness of expenditures; and 7) maximize the security of the transportation system The RTP/SCS includes a chapter titled "Goods Movement." It states that the SCAG region hosts one of the largest clusters of logistics activity in North America. Logistics activities, and the jobs that go with them, depend on complex transportation network. The Goods Movement section of the RTP/SCS sets forth regional strategies to achieve an efficient movement of goods throughout Southern California. It recognizes that the SCAG region will experience dramatic increases in truck traffic on east-west corridors that will cause increased congestion and longer delays to both trucks and general traffic on existing routes.

Goods movement within the SCAG region ranges from moving goods directly from manufacturing centers to local consumers, to those traveling from the San Pedro Bay Ports, to distance destinations across the United States. Goods movement and freight transportation are essential to the SCAG regional economy and quality of life. The regional goods movement system has six primary components: seaports, land ports, air cargo facilities, interstate/highways/local roads, railroads and warehousing/distribution centers. Each component is discussed below:

- Seaports – There are three major ports within the SCAG region: Los Angeles, Long Beach and Hueneme. The Ports of Los Angeles and Long Beach combined are the largest container port complex within the United States. Port Hueneme specializes in the import/export of automobiles, fresh fruit, produce and serves as the primary support facility for the offshore oil industry.
- Land Ports – There are three international border crossings in Imperial County (Calexico West-Mexicali I, Calexico East-Mexicali II and Andrade-Los Algodones. These border crossings are busy commercial land ports primarily used for the transport of agricultural products.
- Air Cargo Facilities – Los Angeles International Airport (LAX) and Ontario International Airport (ONT) handle a combined 96 percent of the SCAG region's air cargo.

- Interstate, Highways, and Local Roads – The roadway system carries a mix of local, domestic trade and international cargoes. The roadway system also provides connections between the ports, manufacturing facilities, intermodal terminals, warehouses and distribution centers.
- Railroads – The Burlington Northern Santa Fe Railway (NBSF) and the Union Pacific (UP) are two Class I railroads that are responsible for carrying international and domestic cargo to and from various areas of the country. Both railroads connect directly to the San Pedro Bay Ports.
- Warehousing and Distribution Centers – As of 2008, the SCAG region consisted of approximately 837 million square feet of warehousing space. Roughly 15 percent of the occupied warehouse space served port-related uses while the remaining 85 percent supported a mix of domestic and international cargo. Distribution facilities for domestic cargo tend to be located in areas farther away from the Ports – such as the Inland Empire.

REGIONAL FREEWAY SYSTEM

Based on information from the SCAG 2012-2035 Regional Transportation Plan (RTP), sections of the I-710, I-605, SR-60 and SR-91 carry the highest volumes of truck traffic within the SCAG region, with each averaging approximately 25,000 trucks per day. Other major freeways within the area include the I-5, I-10, I-15 and I-210 where some carry as much as 20,000 trucks per day. The regional freeway system is a key component to the regional goods movement within the SCAG region. Trucks use the freeway system to carry freight between businesses and consumers throughout the SCAG region. The I-710 is anticipated to experience the highest growth in truck traffic related to the growth in port-related traffic. Considerable growth in truck traffic is also anticipated on the I-10 and I-210 Freeway with the highest growth of the east-west corridors is expected for the SR-60 Freeway.

Based on information from the SCAG 2012-2035 Regional Transportation Plan (RTP), 87.9 percent of all truck trips are anticipated to remain internal to Riverside County. The remaining 12.1 percent are external trips generated within Riverside County and leaving the SCAG region. The internal truck trips have origins and destinations within the SCAG region and are generated by local industries, construction sites, domestic warehouses, domestic truck terminals and residences. The external truck trips are interregional that reflect trade between the SCAG region and the remainder of the United States. There are also port truck trips, secondary port truck trips and intermodal truck trips; however, these trips account for less than six percent of the overall truck trips.

Exhibit 1 illustrates the SCAG region truck routes, and shows the distribution of truck traffic external to the SCAG region, per the 2012-2035 RTP. Based on the 50 peak hour trip threshold, the I-10 and SR-60 Freeway segments listed previously on Table 1 are anticipated to receive 50 or more Project-related peak hour trips, and were thus selected for further analysis.

FREEWAY MAINLINE SEGMENT ANALYSIS METHODOLOGY & ASSUMPTIONS

The freeway segment analysis is based on the methodology described in Chapter 11 of the Highway Capacity Manual (HCM 2010), and performed using HCS 2010 software. The performance measure preferred by Caltrans to calculate LOS is density. Density is expressed in terms of passenger cars per mile per lane. Table 2 illustrates the freeway segment LOS thresholds for each density range utilized for this analysis. The freeway segments evaluated in this supplemental analysis are based on peak hour directional volumes.

The number of lanes for existing baseline conditions has been obtained from field observations conducted by Urban Crossroads or through aerial imagery. The existing freeway geometrics have been utilized for the following traffic conditions: Existing (2014) and Existing Plus Project (E+P) traffic conditions. The planned improvements for the I-10 Freeway have been assumed for Horizon Year (2035) Without and With Project traffic conditions.

The I-10 Freeway and SR-60 Freeway mainline volume data was obtained from the Caltrans Performance Measurement System (PeMS) website for each of the segments identified in Table 1. In addition, truck traffic, represented as a percentage of total traffic, has been utilized for the purposes of this analysis in an effort to not overstate traffic volumes and potential impacts. As such, actual vehicles (as opposed to passenger-car-equivalent volumes) have been utilized for the purposes of the basic freeway segment analysis, which is consistent with the HCM 2010 Basic Freeway Segment analysis methodology.

TABLE 2: FREEWAY MAINLINE LOS THRESHOLDS

Level of Service	Description	Density Range (pc/mi/ln)[1]
A	Free-flow operations in which vehicles are relatively unimpeded in their ability to maneuver within the traffic stream. Effects of incidents are easily absorbed.	0.0 – 11.0
B	Relative free-flow operations in which vehicle maneuvers within the traffic stream are slightly restricted. Effects of minor incidents are easily absorbed.	11.1 – 18.0
C	Travel is still at relative free-flow speeds, but freedom to maneuver within the traffic stream is noticeably restricted. Minor incidents may be absorbed, but local deterioration in service will be substantial. Queues begin to form behind significant blockages.	18.1 – 26.0
D	Speeds begin to decline slightly and flows and densities begin to increase more quickly. Freedom to maneuver is noticeably limited. Minor incidents can be expected to create queuing as the traffic stream has little space to absorb disruptions.	26.1 – 35.0

Level of Service	Description	Density Range (pc/mi/ln)[1]
E	Operation at capacity. Vehicles are closely spaced with little room to maneuver. Any disruption in the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. Any incident can be expected to produce a serious disruption in traffic flow and extensive queuing.	35.1 – 45.0
F	Breakdown in vehicle flow.	>45.0

[1] *pc/mi/ln = passenger cars per mile per lane. Source: HCM 2010, Chapter 11*

EXISTING (2014) CONDITIONS ANALYSIS

Existing freeway segment directional volumes for the AM and PM peak hours are indicated on Table 3. The I-10 Freeway and SR-60 Freeway segments analyzed were found to operate at an acceptable LOS (i.e., LOS "D" or better) during the peak hours, with the exception of the following three segments:

ID	Freeway	Direction	Segment	Level of Service
2	I-10	Westbound	Waterman Av. to Tippecanoe Av.	LOS "E" AM peak hour only
3	I-10	Westbound	Tippecanoe Av. to Mountain View Av.	LOS "E" AM peak hour only
21	I-10	Eastbound	Mountain View Av. to California St.	LOS "E" AM peak hour only

Existing basic freeway segment analysis worksheets are provided in Attachment "A".

EXISTING PLUS PROJECT CONDITIONS ANALYSIS

E+P conditions freeway segment directional volumes for the AM and PM peak hours are also shown on Table 3. Project traffic was added to the Existing volumes based on a combination of the Project's trip distribution from the 2014 Traffic Study and the likely regional distribution pattern of trucks within the SCAG region (see Exhibit 1).

As shown on Table 3, I-10 and SR-60 Freeway segments analyzed were found to operate at an acceptable LOS (i.e., LOS "D" or better) during the peak hours under E+P conditions, with the exception of the segments previously identified as deficient under Existing traffic conditions. In other words, the addition of Project traffic is not anticipated to result in any additional freeway segment deficiencies. E+P conditions basic freeway segment analysis worksheets are provided in Attachment "B".

OPENING YEAR CUMULATIVE (2017) CONDITIONS

PLANNED ENHANCEMENTS TO THE REGIONAL FREEWAY SYSTEM

A review of currently planned freeway improvements in the region did not reveal any improvements to

the SR-60 or I-10 Freeway segments assessed in this letter that would be in place by the year 2017. As such, no improvements have been analyzed for Opening Year Cumulative (2017) traffic conditions.

OPENING YEAR CUMULATIVE (2017) CONDITIONS ANALYSIS

Opening Year Cumulative (2017) freeway segment directional volumes for the AM and PM peak hours are provided on Table 4 for both Without and With Project conditions. Project traffic has been added to the Opening Year Cumulative (2017) Without Project forecasts to develop Opening Year Cumulative (2017) With Project traffic conditions.

As shown on Table 4, I-10 Freeway and SR-60 Freeway segments analyzed were found to operate at an acceptable LOS (i.e., LOS "D" or better) during the peak hours for Opening Year Cumulative (2017) Without and With Project traffic conditions, with the exception of the following five segments:

ID	Freeway	Direction	Segment	Level of Service
1	I-10	Westbound	I-215 Freeway to Waterman Av.	LOS "E" AM peak hour only
2	I-10	Westbound	Waterman Av. to Tippecanoe Av.	LOS "E" AM peak hour only
3	I-10	Westbound	Tippecanoe Av. to Mountain View Av.	LOS "F" AM peak hour only
20	I-10	Eastbound	Tippecanoe Av. to Mountain View Av.	LOS "E" PM peak hour only
21	I-10	Eastbound	Mountain View Av. to California St.	LOS "F" AM peak hour only

Opening Year Cumulative (2017) Without and With Project basic freeway segment analysis worksheets are provided in Attachments "C" and "D", respectively.

HORIZON YEAR (2035) CONDITIONS

PLANNED ENHANCEMENTS TO THE REGIONAL FREEWAY SYSTEM

The SCAG 2012-2035 Regional Transportation Plan (RTP) and SANBAG have future plans in place for the widening of I-10 Freeway through the study area; however, a schedule for the widening of the I-10 Freeway between Haven Avenue in the City of Ontario and the San Bernardino and Riverside County line has not been set. The I-10 Corridor Project proposes to add a carpool lane (high-occupancy vehicle or HOV lane) in each direction. As indicated on the SCAG 2012-2035 RTP, the additional carpool lanes between Haven Avenue to Ford Street in the City of Redlands is anticipated to be completed in 2020. The additional carpool lane between Ford Street and the San Bernardino and Riverside County line is anticipated to be completed in 2030. As such, the future expansion of the I-10 Freeway has been assumed for the long-range Horizon Year (2035) analysis only. Based on discussions with Caltrans staff, the freeway mainline volumes can potentially be reduced up to fourteen (14) percent with the addition of a single HOV lane.

HORIZON YEAR (2035) CONDITIONS ANALYSIS

Horizon Year (2035) freeway segment directional volumes for the AM and PM peak hours are provided on Table 5 for both Without and With Project conditions. Project traffic has been added to the Horizon Year (2035) Without Project forecasts for Horizon Year (2035) With Project traffic conditions. As shown on Table 5, all I-10 and SR-60 Freeway segments analyzed were found to operate at an unacceptable LOS (i.e., LOS "E" or worse) during either the AM or PM peak hours for both Without and With Project traffic conditions with the exception of the following segments:

ID	Freeway	Direction	Segment
8	I-10	Westbound	Cypress Av. to Ford St.
9	I-10	Westbound	Ford St. to Wabash Av.
11	I-10	Westbound	Yucaipa Bl. to Live Oak Canyon Rd.
39	SR-60	Westbound	Perris Bl. To Nason St.
41	SR-60	Westbound	Moreno Beach Dr. to Redlands Bl.
43	SR-60	Westbound	Theodore St. to Gilman Springs Rd.
44	SR-60	Westbound	Gilman Springs Rd. to Jack Rabbit Tr.
50	SR-60	Eastbound	Perris Bl. To Nason St.
51	SR-60	Eastbound	Nason St. to Moreno Beach Dr.
52	SR-60	Eastbound	Moreno Beach Dr. to Redlands Bl.
54	SR-60	Eastbound	Theodore St. to Gilman Springs Rd.

Horizon Year (2035) Without and With Project basic freeway segment analysis worksheets are provided in Attachments "E" and "F", respectively.

[1] Number of lanes are in the specified direction and is based on existing conditions.

[2] I-10 Eastbound and Westbound volumes from the I-215 Freeway to W. County Line Road shown on this table have been reduced to account for the proposed HOV lane in each direction.

[3] Density is measured by passenger cars per mile per lane (pc/mi/ln).

* **BOLD** = Unacceptable Level of Service

Mr. Oscar Uranga
TSG Cherry Valley, L.P.
1900 Quail Street
Newport Beach, CA 92660

SUBJECT: SAN GORGONIO CROSSING SUPPLEMENTAL TRAFFIC ANALYSIS

Dear Mr. Oscar Uranga:

INTRODUCTION

This Supplemental Traffic Analysis for the proposed San Gorgonio Crossing ("Project") seeks to evaluate potential traffic impacts under Horizon Year (2035) traffic conditions for the future Roberts Road / Cherry Valley Boulevard intersection. The Project was recently assessed for traffic impacts in the *San Gorgonio Crossing (Parcel Map 36093) Traffic Impact Analysis* (prepared by Urban Crossroads, dated November 5, 2014, referred to as "Traffic Study"). The Project is proposed to consist of 1,860,760 square feet of high-cube distribution warehouse.

SUMMARY OF FINDINGS

Horizon Year (2035) traffic forecasts for the future Roberts Road / Cherry Valley Boulevard intersection were developed based on Riverside County Traffic Analysis Model (RivTAM). The intersection of Roberts Road / Cherry Valley Boulevard is anticipated to operate at deficient level of service (LOS) under Horizon Year (2035) Without Project traffic conditions. The intersection would continue to operate at a deficient LOS with the addition of Project traffic. In addition, the future Roberts Road / Cherry Valley Boulevard intersection is anticipated to meet traffic signal warrant based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets.

Table 1 lists the recommended improvements necessary to reduce the identified intersection LOS deficiency for Horizon Year (2035) With Project traffic conditions. In addition, Table 1 also indicates those improvements currently included in existing fee programs. The Project's "fair share" percentage has also been calculated where applicable.

PROJECTED FUTURE TRAFFIC

Traffic projections for Horizon Year (2035) Without Project conditions were derived from RivTAM using accepted procedures for model forecast refinement and smoothing. The traffic forecasts reflect the area-wide growth anticipated between Existing conditions, and Horizon Year conditions.

The future Horizon Year peak hour turning movements were then reviewed by Urban Crossroads for reasonableness, and were adjusted to achieve flow conservation, reasonable growth, and reasonable diversion between parallel routes. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two freeway ramp locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there are no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis. Horizon Year (2035) With Project traffic volumes was calculated by adding the Project traffic from the Traffic Study to the Horizon Year (2035) Without Project traffic volumes.

Post processing worksheets and volume development worksheets for Horizon Year (2035) traffic conditions are provided in Attachment "A".

INTERSECTION OPERATIONS ANALYSIS

Level of service (LOS) calculations were conducted for the study intersection to evaluate its operations under Horizon Year (2035) Without and With Project traffic conditions. As shown in Table 2, the future Roberts Road / Cherry Valley Boulevard intersection is anticipated to operate at an unacceptable LOS (LOS "F") under Horizon Year (2035) Without and With Project traffic conditions.

The intersection operations analysis worksheets for Horizon Year (2035) Without and With Project traffic conditions are included in Attachment "B".

TRAFFIC SIGNAL WARRANTS

Future unsignalized intersection has been assessed regarding the potential need for a new traffic signal based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets. For Horizon Year (2035) without Project conditions, a traffic signal appears to be warranted at the future Roberts Road / Cherry Valley Boulevard intersection (See Attachment "C").

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with level of service. An intersection may

satisfy a signal warrant condition and operate at or above LOS "C" or operate below LOS "C" and not meet a signal warrant.

RECOMMENDED IMPROVEMENTS

The following improvements are necessary to reduce peak hour delay and improve the associated LOS to acceptable levels at the future Roberts Road / Cherry Valley Boulevard intersection for Horizon Year (2035) traffic conditions:

- Install a traffic signal
- Construct a southbound left turn lane
- Construct an eastbound left turn lane
- Construct 2nd eastbound through lane
- Construct 2nd westbound through lane
- Construct westbound right turn lane

The effectiveness of the recommended improvement strategies necessary to address Horizon Year With Project traffic deficiencies are presented in Table 3.

The intersection operations analysis worksheets for Horizon Year With Project traffic conditions, with improvements, are included in Attachment "D".

PROJECT FAIR SHARE

As shown on Table 4, the Project's fair share has been calculated for the impacted intersection based on Horizon Year (2035) With Project traffic conditions assessed in this supplemental analysis.

If you have any questions, please contact me directly at (949) 660-1994, extension 204.

Respectfully submitted,

URBAN CROSSROADS, INC.

Aric Evatt, PTP

Table 1

Summary of Intersection Improvements

#	Intersection Location	Jurisdiction	Recommended Improvements Horizon Year (2035) Traffic Conditions	Improvements in TUMF or DIF[1]?	Fair Share %[2]
10	Roberts Road / Cherry Valley Boulevard	County of Riverside	- Traffic Signal	No	11.2%
			- SB left turn lane	No	
			- EB left turn lane	No	
			- 2nd EB through lane	Yes (TUMF)	
			- 2nd WB through lane	Yes (TUMF)	
			- WB right turn lane	No	

[1] Improvements are identified as being included in the Western Riverside Council of Governments (WRCOG) Transportation Uniform Mitigation Fee (TUMF) program or as a County of Riverside DIF facility.

[2] Program improvements constructed by project may be eligible for fee credit, at discretion of County of Riverside. See Table 4 for Fair Share Calculations.

Table 2

Intersection Analysis for Horizon Year (2035) Conditions

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1]												2035 Without Project				2035 With Project			
			Northbound			Southbound			Eastbound			Westbound			Delay[2] (secs.)		Level of Service		Delay[2] (secs.)		Level of Service	
			L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM	AM	PM	AM	PM
10	Calimesa Boulevard / Cherry Valley Bl.	CSS	0	0	0	0	1	0	0	1	0	0	1	0	**>100.0**	**>100.0**	**F**	**F**	**>100.0**	**>100.0**	**F**	**F**

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; d = Defacto Right Turn Lane; **1** = Improvement

[2] Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-street Stop

Table 3

Recommended Improvements for Horizon Year (2035) With Project Conditions

#	Intersection	Traffic Control[3]	Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
			Northbound			Southbound			Eastbound			Westbound						
			L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
10	Calimesa Boulevard / Cherry Valley Bl.																	
	- Without Improvements	CSS	0	0	0	0	1	0	0	1	0	0	1	0	**>100.0**	**>100.0**	**F**	**F**

SUBJECT: SAN GORGONIO CROSSING ALTERNATIVES TRIP GENERATION EVALUATION

Dear Mr. Oscar Uranga:

The firm of Urban Crossroads, Inc. is pleased to submit the following Alternatives Trip Generation Evaluation for the San Gorgonio Crossing ("Project"). The Project was recently assessed for traffic impacts in the *San Gorgonio Crossing (Parcel Map 36093) Traffic Impact Analysis* (prepared by Urban Crossroads, dated November 5, 2014, referred to as "Traffic Study"). The Project is proposed to consist of 1,860,760 square feet of high-cube warehouse. The purpose of this trip generation analysis is to compare the trip generation for each of the alternatives to that previously assumed and analyzed for the Project in the Traffic Study.

DESCRIPTION OF ALTERNATIVES

The following development alternatives are analyzed as part of this trip generation evaluation:

- Alternative 1 (No Project – General Plan Build Alternative): 216 single-family homes.
- Alternative 2 (Residential Alternative): 331 single-family homes, 240 apartments and 221townhomes for a total of 792 residential units.
- Alternative 3 (Reduced Intensity Alternative): 1,302,532 square feet of high-cube distribution warehouse.
- Alternative 4 (Light Industrial / Business Park Alternative): 1,012,760 square feet of high-cube warehouse and 400,000 square feet of business park.

PROJECT AND ALTERNATIVES TRIP GENERATION

Trip generation represents the amount of traffic which is both attracted to and produced by a development. Determining traffic generation for a specific project is therefore based upon forecasting the amount of traffic that is expected to be both attracted to and produced by the specific land uses being proposed for a given development. The trip generation rates used for this assessment are based upon information collected by the Institute of Transportation Engineers (ITE) as provided in their *Trip Generation* manual, 9th Edition, 2012.

ITE land use codes 152 (High-Cube Warehousing), 210 (Single Family Detached Residential), 220 (Apartment), 230, (Residential Condominium / Townhouse) and 770 (Business Park) have been utilized to derive specific trip generation estimates for the proposed Project and the four alternatives.

Refinements to these raw trip generation estimates have been made to provide a more detailed breakdown of trips by vehicle mix. The vehicle mix percentages were obtained from data collected by the South Coast Air Quality Management District (SCAQMD) and applied to ITE truck trip generation rates for land use code 152 (High-Cube Warehousing). In addition, Passenger Car Equivalents (PCE) factors have been applied to the trip generation rates for heavy trucks (large 2-axles, 3-axles, 4+-axles). PCE factors have been utilized due to the expected heavy truck component for the proposed industrial uses. PCE factors allow the typical "real-world" mix of vehicle types to be represented as a single, standardized unit, such as the passenger car, for the purposes of capacity and level of service analyses. These PCE factors are consistent with the values recommended by the San Bernardino Associated Governments (SANBAG) and are accepted factors in the County of Riverside.

PROPOSED PROJECT TRIP GENERATION

Daily and peak hour trip generation for the proposed Project is shown in Table 1. The Project is estimated to generate a net total of approximately 4,905 net passenger car equivalent (PCE) trip-ends per day on a typical weekday with approximately 288 PCE net AM peak hour trips and 335 PCE net PM peak hour trips.

TABLE 1: PROPOSED PROJECT TRIP GENERATION SUMMARY

ALTERNATIVE 1(NO PROJECT – GENERAL PLAN BUILD ALTERNATIVE) TRIP GENERATION

Table 2 summarizes the resulting trip generation estimates based on No Project – General Plan Alternative, and is calculated to generate a net total of approximately 2,056 trip-ends per day with 162 AM peak hour trips and 216 PM peak hour trips. As shown on Table 3, the No Project-General Plan Build Alternative is anticipated to generate fewer trips than the proposed Project.

ALTERNATIVE 3 (REDUCED INTENSITY ALTERNATIVE) TRIP GENERATION

Table 4 summarizes the resulting trip generation estimates based on Reduced Intensity Alternative, and is calculated to generate a net total of approximately 3,433 net passenger car equivalent (PCE) trip-ends per day on a typical weekday with approximately 202 PCE net AM peak hour trips and 235 PCE net PM peak hour trips. As shown on Table 4, the Reduced Intensity Alternative is anticipated to generate fewer trips than the proposed Project.

[2] Vehicle Mix Source: Total truck percentage source from ITE Trip Generation manual. Truck mix (by axle type) source from SCAQMD for high-cube warehouse use and from the City of Fontana Truck Trip Generation Study for warehousing and general light industrial uses.

[3] TOTAL NET TRIPS (PCE) = Passenger Cars + Net Truck Trips (PCE).

ALTERNATIVE 4 (LIGHT INDUSTRIAL / BUSINESS PARK ALTERNATIVE) TRIP GENERATION

Table 5 summarizes the resulting trip generation estimates based on Light Industrial / Business Park Alternative. This alternative would consist of 1,012,760 square feet of high-cube warehouse building and 400,000 square feet of multiple flex-type buildings that lends itself to a variety of light industrial, office and retail uses.

Light Industrial Business Park Alternative is calculated to generate a net total of approximately 7,645 net passenger car equivalent (PCE) trip-ends per day on a typical weekday with approximately 717 PCE net AM peak hour trips and 686 PCE net PM peak hour trips.

As shown on Table 5, the Reduced Intensity Alternative is anticipated to generate more trips than the proposed Project.

TABLE 5: ALTERNATIVE 4 (LIGHT INDUSTRIAL / BUSINESS PARK) TRIP GENERATION SUMMARY

TRIP GENERATION COMPARISON

Alternative 1 (No Project – General Plan Build Alternative) and Alternative 3 (Reduced Intensity Alternative) are calculated to generate fewer trip-ends per day and fewer AM peak hour and PM peak hour trips as compared to the proposed Project.

Alternative 2 (Residential Alternative) and Alternative 4 (Light Industrial / Business Park Alternative) are calculated to generate more trip-ends per day and more AM peak hour and PM peak hour trips as compared to the proposed Project.

Irvine, CA 92614

SUBJECT: SAN GORGONIO CROSSING SUPPLEMENTAL TRAFFIC ANALYSIS

Dear Mr. Lonnie Ellisor:

The firm of Urban Crossroads, Inc. is pleased to submit the following Supplemental Traffic Analysis for the San Gorgonio Crossing ("Project"). The Project was recently assessed for traffic impacts in the *San Gorgonio Crossing (Parcel Map 36093) Traffic Impact Analysis* (prepared by Urban Crossroads, dated November 5, 2014, referred to as "Traffic Study"). The Project is proposed to consist of 1,860,760 square feet of high-cube warehouse.

The Traffic Study found that the I-10 Freeway at Cherry Valley Boulevard interchange ("interchange") ramp intersections currently operate at an unacceptable level of service (LOS "F") under Existing (2014) traffic conditions. Based on discussions with Caltrans District 8 staff, it is our understanding that ultimate improvement plans have not yet been finalized for the interchange, however a roundabout concept is being proposed by the City of Calimesa. As timing of future improvements to the interchange are uncertain, the purpose of this supplemental traffic analysis is to assess whether interim traffic signals at the interchange ramps can reduce the delay and improve the associated LOS grade to acceptable levels under Existing plus Ambient Growth plus Project (EAP 2017), Near-term (2019) and Near-term (2019) plus Sunny-Cal traffic conditions. In addition, vehicle queues will also be considered along with potential impact to operations of the adjacent Calimesa Boulevard at Cherry Valley Boulevard intersection.

Based on discussions with County of Riverside staff, the intersection operations and queuing analyses have been done using passenger car equivalent (PCE) volumes consistent with the Traffic Study.

SUMMARY OF FINDINGS

The Project proposes to fund the construction of interim improvements at the I-10 at Cherry Valley interchange, which are listed below:

- Traffic signals at I-10 eastbound and westbound ramp intersections at Cherry Valley Boulevard
- Restripe to provide eastbound and westbound left turn pockets within the existing width of the Cherry Valley Boulevard bridge
- Add a southbound right turn lane on the off ramp at the intersection of I-10 EB ramps at Cherry Valley Boulevard

- Add a westbound right turn lane at the intersection of I-10 WB ramps at Cherry Valley Boulevard
- Realign Calimesa Boulevard approximately 550 feet east of I-10 westbound ramps at Cherry Valley Boulevard intersection.
- Add an eastbound left turn lane at the intersection of Calimesa Boulevard at Cherry Valley Boulevard

The new traffic signals will significantly increase the capacity of the I-10 at Cherry Valley interchange ramp intersections during the peak hours such that even with the addition of project traffic, delay and level of service will be greatly improved as compared to the current conditions.

The intersection of Calimesa Boulevard at Cherry Valley Boulevard is currently operating at an acceptable LOS (i.e., LOS "D" or better), and is anticipated to continue to operate at an acceptable LOS with the addition of ambient growth and Project traffic. However, Calimesa Boulevard is located approximately 150 feet from the intersection of I-10 WB ramps and Cherry Valley Boulevard which could have potential queueing issues with the installation of traffic signals. The intersection of Calimesa Boulevard is proposed to be realigned approximately 550 feet to the east, which would increase the distance between Calimesa Boulevard and the I-10 WB ramp, and mitigate potential queueing issues for westbound traffic towards the interchange. Peak hour queuing assessment for near-term with Project traffic conditions indicates 95th percentile queues can be accommodated within available stacking distance on Cherry Valley Boulevard and I-10 Freeway off-ramps with the proposed improvements.

Based on the concept plans currently being considered for the roundabout interchange alternative, the intersection of Calimesa Boulevard and Cherry Valley Boulevard will ultimately require realignment to the east to accommodate the planned future interchange ramp configuration. It is recommended that the applicant coordinate with City of Calimesa and the County of Riverside to relocate Calimesa Boulevard at an alignment consistent with the planned ultimate improvements at the I-10 Freeway at Cherry Valley Boulevard interchange. By placing the realigned intersection at its ultimate location the costs associated with these improvements could be eligible for reimbursement when the ultimate interchange project is constructed.

IMPROVEMENT RECOMMENDATIONS

I-10 AT CHERRY VALLEY INTERCHANGE

Based on the review of the interchange conducted in December 2015, the following improvements for the installation of interim traffic signals has been proposed:

- Traffic signals with turn pockets provided within the existing width of the Cherry Valley Boulevard Bridge.

Concept striping plan for the improvements at the interchange is shown on Exhibit 1. Note that the concept is for the purpose of discussion with the stakeholders and a detailed survey will have to be conducted during the final design.

In addition to the traffic signals, the following additional lane improvements are recommended in order to improve the LOS above existing conditions and also accommodate the 95th percentile queues on the ramps:

- Add a westbound left turn lane at the intersection of I-10 EB ramps at Cherry Valley Boulevard
- Add a southbound right turn lane on the off-ramp at the intersection of I-10 EB ramps at Cherry Valley Boulevard
- Add an eastbound left turn lane at the intersection of I-10 WB ramps at Cherry Valley Boulevard
- Add a westbound right turn lane at the intersection of I-10 WB ramps at Cherry Valley Boulevard

CALIMESA BOULEVARD / CHERRY VALLEY BOULEVARD INTERSECTION

Concept striping plan has been provided for the following improvements at the intersection of Calimesa Boulevard at Cherry Valley Boulevard:

- Realign Calimesa Boulevard approximately 550 feet east of I-10 westbound ramps at Cherry Valley Boulevard intersection.
- Add an eastbound left turn lane at the intersection of Calimesa Boulevard at Cherry Valley Boulevard

Concept striping plan for improvements at intersection of Calimesa Boulevard and Cherry Valley Boulevard is shown on Exhibit 2. Note that the concept is for the purpose of discussion with the stakeholders and a detailed survey will have to be conducted during the final design.

INTERSECTION OPERATIONS ANALYSIS

Weekday AM and PM peak hour intersection capacity analysis was conducted at the I-10 Freeway at Cherry Valley Boulevard interchange intersections based on Highway Capacity Manual (HCM) 2010 methodology. The capacity analysis was conducted to assess if the interim traffic signals could improve the delay and LOS at the interchange under the following traffic conditions.

EAP (2017) conditions, consistent with the scenario evaluated in the Traffic Study included the following traffic volumes:

- Existing (2014) traffic
- Growth of 6% to account for three years of ambient growth
- Project traffic

Near-term (2019) conditions included the following traffic volumes:

- Existing (2014) traffic
- Growth of 10% to account for five years of ambient growth
- Project traffic

An additional scenario with near-term (2019) conditions plus traffic from the proposed Sunny-Cal development consisting of 497 Single Family Detached Residential was also analyzed.

Near-term (2019) plus Sunny-Cal conditions included the following traffic volumes:

- Existing (2014) traffic
- Growth of 10% to account for five years of ambient growth
- Project traffic
- Sunny-Cal Residential traffic

The intersection analysis results for EAP (2017), near-term (2019) and near-term (2019) plus Sunny-Cal traffic conditions are summarized in Table 1 which indicates that with the installation of traffic signals, the I-10 Freeway at Cherry Valley Boulevard interchange intersections are anticipated to operate at acceptable LOS (i.e., LOS "D" or better) under all the scenarios.

ADJACENT INTERSECTIONS

The following closely spaced adjacent intersections to the interchange could be affected by the installation of traffic signals at the ramps:

Roberts Road / Cherry Valley Boulevard: The Roberts Road at Cherry Valley Boulevard intersection located to the immediate west of the I-10 WB ramps is currently controlled by an all-way stop. The southern leg of the intersection was closed to traffic during field review conducted in December 2015.

It is our understanding that Roberts Road is proposed to be realigned further west from its current location on Cherry Valley Boulevard. With the installation of traffic signal at I-10 WB ramps at Cherry Valley Boulevard, the all-way stop at Roberts Road at Cherry Valley Boulevard intersection has to be converted to a cross-street stop until the ultimate realignment of Roberts Road. The intersection is anticipated to operate under acceptable LOS (LOS "D" or better) under EAP (2017), near-term (2019) and near-term (2019) plus Sunny-Cal traffic conditions with a cross-street stop control.

Calimesa Boulevard / Cherry Valley Boulevard: The Calimesa Boulevard at Cherry Valley Boulevard intersection located to the immediate east of the I-10 WB ramps is currently controlled by a cross-street stop. The intersection of Calimesa Boulevard at Cherry Valley Boulevard is currently operating at an acceptable LOS (i.e., LOS "D" or better), and is anticipated to continue to operate at an acceptable LOS (LOS "D" or better) under EAP (2017), near-term (2019) and near-term (2019) plus Sunny-Cal traffic conditions.

The intersection of Calimesa Boulevard at Cherry Valley Boulevard is proposed to be realigned to the east, which would increase the distance between Calimesa Boulevard and the I-10 westbound ramp, and mitigate potential queuing issues east of the interchange. Based on the concept plans currently being considered for the roundabout interchange alternative, the intersection of Calimesa Boulevard and

Cherry Valley Boulevard will ultimately require realignment to the east to accommodate the planned future interchange ramp configuration. It is recommended that the applicant coordinate with City of Calimesa and the County of Riverside to relocate Calimesa Boulevard at an alignment consistent with the planned ultimate improvements at the I-10 Freeway at Cherry Valley Boulevard interchange. By placing the realigned intersection at its ultimate location the costs associated with these improvements could be eligible for reimbursement when the ultimate interchange project is constructed. An eastbound left turn lane with 300 feet of storage has been assumed for this alternative.

The intersection analysis results for the intersection of Calimesa Boulevard at Cherry Valley Boulevard, with improvements are also summarized in Table 1 which indicates that the intersection is anticipated to operate at acceptable LOS (LOS "D" or better) under EAP (2017), near-term (2019) and near-term (2019) plus Sunny-Cal traffic conditions with Calimesa Boulevard realignment and a cross-street stop control.

Worksheets for EAP (2017) traffic conditions analysis is provided in Attachments "A", worksheets for near-term (2019) traffic conditions analysis is provided in Attachment "B" and worksheet for near-term (2019) plus Sunny-Cal traffic conditions analysis is provided in Attachment "C".

QUEUING ANALYSIS

SimTraffic software has been utilized to assess peak hour queuing on Cherry Valley Boulevard for EAP (2017), near-term (2019) and near-term (2019) plus Sunny-Cal traffic conditions. SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine tuning signal operations. SimTraffic uses the input parameters from Synchro to generate random simulations. The 95th percentile queue is not necessarily ever observed; it is simply based on statistical calculations (or Average Queue plus 1.65 standard deviations).

The random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each turn lane. A SimTraffic simulation has been recorded 5 times, during the weekday AM and weekday PM peak hours, and has been seeded for 30-minute periods with 60-minute recording intervals.

The available stacking length and the 95th percentile queues are summarized in Table 2. As shown in Table 2, 95th percentile queues can be accommodated within available stacking distance under EAP (2017), near-term (2019) and near-term (2019) plus Sunny-Cal traffic conditions with the recommended improvements.

The 95th percentile queues for eastbound left turn lane and eastbound through lane on Cherry Valley Boulevard at I-10 WB ramps decrease with the addition of Sunny-Cal traffic in the AM peak hour. This is due to the change in actuated signal splits in SimTraffic with the increase in westbound volumes.

The queuing analysis worksheets for EAP (2017) traffic conditions are provided in Attachment "D", the queuing analysis worksheets for near-term (2019) traffic conditions are provided in Attachment "E" and the queuing analysis worksheets for near-term (2019) plus Sunny-Cal traffic conditions are provided in Attachment "F".

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; **1** = Improvement

[2] Per the 2010 Highway Capacity Manual, overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown. The intersections have been analyzed using the Synchro software.

[3] CSS = Cross-street Stop; TS = Traffic Signal

[4] With the proposed widening of Cherry Valley Boulevard to provide the eastbound left turn lane, it is anticipated that storage for up to two vehicles will be available in the painted median. Two-stage gap acceptance with up to 2 vehicles in median storage assumed for SBL turns from Calimesa Blvd.

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

Table 2

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided.

[2] It should be noted that the additional 15 feet could be accomodated in the turn pocket transition.

1.0 Executive Summary

1.1 Background & Purpose

TSG Cherry Valley, L.P. ("Client") is currently engaged in discussions with public entity and other stakeholders regarding feasibility and entitlements for its San Gorgonio Crossing Project ("Project"). Kosmont Companies ("Kosmont") previously (January 2009, July 2013) prepared analyses to estimate the gross fiscal impacts and economic benefits of the Project to Riverside County ("County") and the greater local region, respectively. Client has requested that Kosmont prepare an updated Fiscal Impact and Economic Benefit Analysis ("Analysis") based on an updated development plan and County feedback regarding the estimation of primary fiscal expenditures in addition to primary fiscal revenues.

1.2 Project Description

The Project is comprised of approximately 1.8 million square feet of logistics / distribution warehouse industrial space located on approximately 228 acres of land near the intersection of Cherry Valley Road and Roberts Road ("Site") in unincorporated County territory, directly south-adjacent to the San Gorgonio Water Agency pipeline and within the vicinity of the City of Calimesa, City of Beaumont, and Cherry Valley Census-Designated Place ("CDP"). The area directly surrounding the Project is comprised primarily of single family homes.

The Project will include surface parking spaces to serve Project employees and ancillary parking for tractor-trailers. The quantity of spaces will be determined through Client's future site design efforts. The Site encompasses assessor parcel numbers ("APN") 407-220-004, 007, 008, 009, 014, 016, and 017. Project value at build-out and stabilization is estimated at approximately $106 million.

1.3 Summary of Annual Primary Fiscal Impacts

The Project is estimated to generate approximately $463,300 annually in primary County fiscal revenues and approximately $212,100 in primary fiscal expenditures, yielding an annual net fiscal impact of approximately $251,200 as detailed in Table 1.1. The 30-year present value of the net fiscal impact generated by the Project (discounted at 6.0%) is approximately $3.9 million.

The analyses, projections, assumptions, rates of return, and any examples presented herein are for illustrative purposes and are not a guarantee of actual and/or future results. Project pro forma and tax analyses are projections only. Actual results may differ materially from those expressed in this analysis.

Table 1.1: Overview of Primary Fiscal Impacts

	Estimated Annual Total	30-Year Nominal Total	30-Year Present Value
Estimated Primary Fiscal Revenues	$463,300	$19,123,900	$8,029,700
Estimated Primary Fiscal Expenditures	$212,100	$10,090,700	$4,082,100
Estimated Net Fiscal Impact	**$251,200**	**$9,033,200**	**$3,947,600**
Revenue/Cost Ratio	*2.18*	*1.90*	*1.97*

Note: 30-Year projections upon full Project build-out and stabilization (2015 dollars).

1.4 Summary of Economic Benefits from Project Construction

Project construction-related expenditures are expected to create short-term construction-related benefits for the local economy. Using a proprietary economic impact model ("IMPLAN"), the Analysis estimates that Project construction will generate approximately 577 jobs, approximately $28.8 million in labor income (i.e. earnings), and approximately $67.5 million in total economic output through direct, indirect, and induced economic activity as detailed in Table 1.2.

Table 1.2: Overview of Economic Benefits from Project Construction

Economic Benefits from Construction

Impact Type	Employment	Labor Income	Output
Direct Effect	400	$21,640,336	$46,200,000
Indirect Effect	73	$3,198,574	$9,049,938
Induced Effect	104	$3,998,238	$12,295,421
Total Countywide	**577**	**$28,837,148**	**$67,545,360**
Estimated Calimesa Capture	18	$719,681	$2,134,536

Notes: Cumulative impacts during construction period. Values in 2015 dollars.

1.5 Summary of Economic Benefits from Ongoing Operation

Upon build-out and stabilization, ongoing operation of the Project is estimated by IMPLAN to generate approximately 748 jobs (including 507 permanent on-site full-time equivalent or "FTE" jobs and 241 off-site indirect and induced jobs), $31.9 million in annual labor income, and $67.9 million in annual economic output (includes approximately $42.6 million in direct on-site output and approximately $25.4 million in off-site indirect and induced industry output) as detailed in Table 1.3.

Table 1.3: Overview of Economic Benefits from Ongoing Operation

Economic Benefits from Ongoing Operation

Impact Type	Employment	Labor Income	Output
Direct Effect	518	$23,199,482	$42,554,004
Indirect Effect	116	$4,286,442	$11,782,256
Induced Effect	115	$4,410,044	$13,573,251
Total Countywide	**748**	**$31,895,968**	**$67,909,512**
Estimated Calimesa Capture	23	$869,649	$2,535,551

Notes: Annual impacts upon build-out and stabilization. Values in 2015 dollars.

2.0 Introduction

2.1 Background & Purpose

Client is currently engaged in discussions with public entity and other stakeholders regarding feasibility and entitlements for the Project. Kosmont previously (January 2009, July 2013) prepared an analysis to estimate the gross fiscal impacts and economic benefits of the Project to the County and the greater local region, respectively. Client has requested that Kosmont prepare an updated Analysis based on an updated development plan and County feedback regarding the estimation of primary fiscal expenditures in addition to primary fiscal revenues.

2.2 Project Description

The Project is comprised of approximately 1.8 million square feet of logistics / distribution warehouse industrial space located on approximately 228 acres of land near the intersection of Cherry Valley Road and Roberts Road in unincorporated County territory, directly south-adjacent to the San Gorgonio Water Agency pipeline and within the vicinity of the City of Calimesa, City of Beaumont, and Cherry Valley CDP (see exhibit 2.2). The area directly surrounding the Project is comprised primarily of single family homes.

The Project will include surface parking spaces to serve Project employees and ancillary parking for tractor trailers. The quantity of spaces will be determined through Client's future site design efforts. The Site encompasses APNs 407-220-004, 007, 008, 009, 014, 016, and 017. Project value at build-out and stabilization is estimated at approximately $106 million.

The analyses, projections, assumptions, rates of return, and any examples presented herein are for illustrative purposes and are not a guarantee of actual and/or future results. Project pro forma and tax analyses are projections only. Actual results may differ materially from those expressed in this analysis.

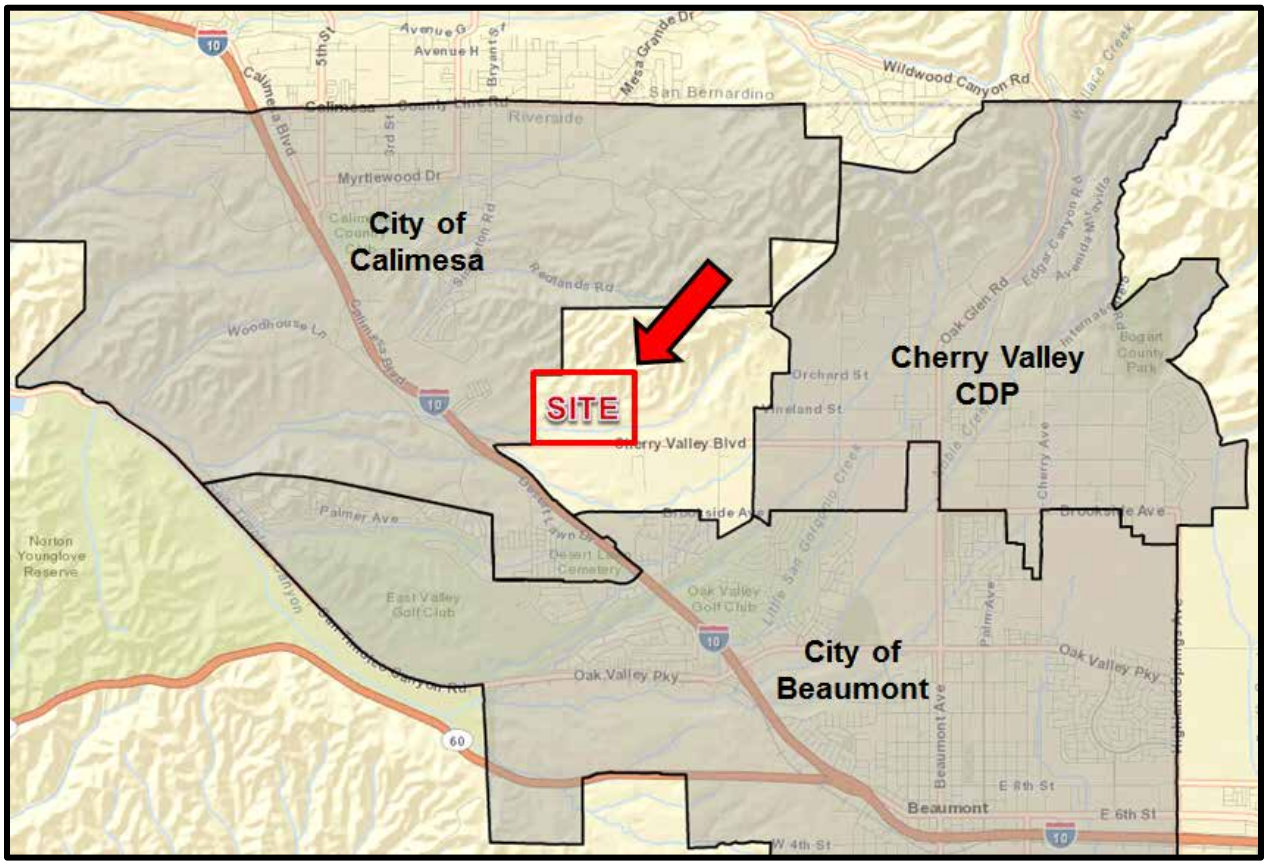
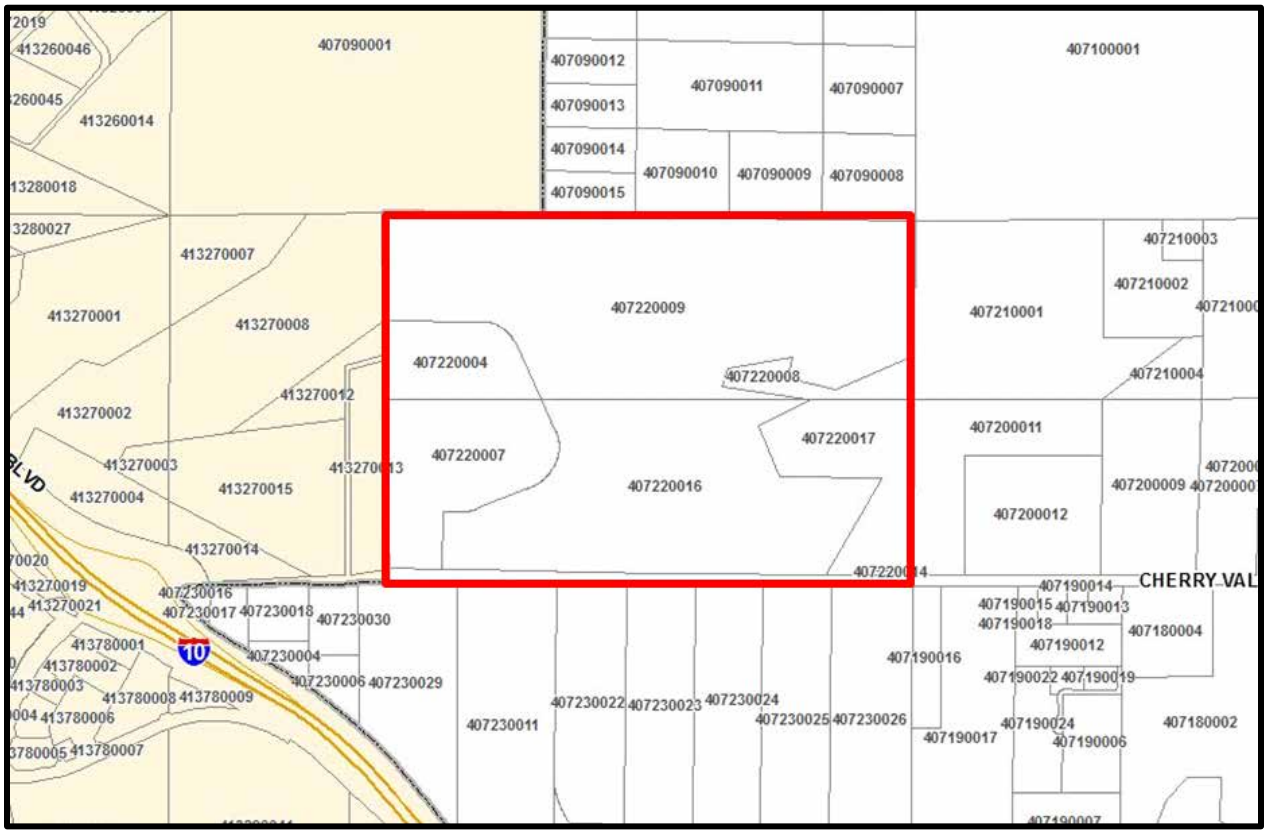
Exhibit 2.2: Site Location Map



Source: TSG Cherry Valley, L.P.; ESRI (2015)

Exhibit 2.3: Parcel Map



Source: Riverside County Geographic Information System (2015)

3.0 Methodology

This Analysis is based on information provided by the Client, the County, the IMPLAN Group, Riverside County Property Tax Auditor-Controller's Office, Southern California Association of Governments ("SCAG"), ESRI, and the California State Board of Equalization ("BOE").

3.1 General Assumptions

General assumptions are as follows with more specific assumptions denoted in Appendix A:

- Dollar amounts are expressed in 2015 dollars.
- Fiscal impacts are estimated at full Project build-out and stabilized occupancy.
- Construction employment figures are short-term jobs.
- On-site employment figures are permanent FTE jobs.

3.2 Fiscal Revenue and Expenditure Analysis

3.2.1 Property Tax

Secured property tax revenues are estimated based on the anticipated assessed value of the Project upon full build-out and the applicable property tax rates for the County. The Site is located in County tax rate area ("TRA") #056-035. The County general fund receives an approximate 13.2% share of the annual 1.0% secured property tax general levy placed by the County on the assessed value of the property ($0. 13216981 of each $1.00 of secured property tax revenue) within this TRA. Other County property tax distributions include the County Structure Fire Protection (5.2%), Riverside County Flood Control Zone 5 (4.3%), Riverside County Office of Education (3.6%), Riverside County Park & Open Space (0.3%), and Riverside County Flood Control Administration (0.2%). Secured property tax distributions are also shown for other local taxing agencies, as reference (see Appendix B).

Unsecured property taxes are collected based on the assessed value of real property not affixed to the underlying land, such as some vehicles. The rate of taxation and apportionment is generally the same as for secured property taxes. For the purposes of this analysis, the assessed value of unsecured property associated with the Project is estimated to be 10.0% of the assessed value of secured property (standard for industrial land uses).

3.2.2 Property Tax In-Lieu of VLF

Prior to 2004, a percentage of State of California VLF was distributed to cities and counties. As part of the State Budget Act of 2004, the State reduced the VLF rate, and in order to offset the

reduction of VLF revenue to cities and counties, the State increased the city and county allocation of property tax revenue, funded from the Educational Revenue Augmentation Fund ("ERAF"). The amount of property tax in-lieu of VLF to be distributed to cities and counties was calculated by the State for the 2004-2005 fiscal year, and increases each year directly proportional to the change in assessed valuation of taxable property in each jurisdiction from the prior year. Property Tax In-Lieu of VLF resulting from the Project is estimated based on the incremental amount of assessed value that the Project adds to the County, thereby increasing the County's apportionment of property tax in-lieu of VLF (see Appendix C).

3.2.3 Sales and Use Tax

Off-site / indirect sales tax revenue projections are estimated based on the taxable sales generated by the spending by employees off-site within both incorporated and unincorporated areas of the County, and the corresponding County sales tax apportionment. Employee spending is based on U.S. Bureau of Labor Statistics ("BLS") Consumer Expenditure Survey data, which provides spending habits of consumers based on household income. Capture rates for spending by employees within the County are approximated by Kosmont based on preliminary evaluation of existing retail amenities within the local trade area.

The County general fund receives a 1.0% distribution from taxable sales within unincorporated County areas (includes 0.25% Triple Flip apportionment). The Riverside County Transportation Commission ("RCTC") receives a distribution of 0.5% from all taxable sales within the County (incorporated and unincorporated areas), as established in 2009 voter-approved measure to continue until at least 2039. The County receives an additional sales tax distribution from the State Prop 172 Public Safety Fund. Effective January 1, 1994, the State collects a 0.5% sales tax and dedicates the revenue for local public safety activities (e.g., sheriff/police, fire protection, county district attorney, county corrections). The State apportions the Prop 172 revenue to each county based on its proportionate share of statewide taxable sales. In most recent fiscal years, the County average share of the total 0.5% Prop 172 sales tax collected within the County is approximately 95.5% (see Appendices D-E).

3.2.4 "Multiplier" Expenditures

Sheriff and fire protection expenditures are estimated on a per capita multiplier basis, utilizing the County Fiscal Year 2014-15 Adopted Budget and the relevant resident/employee population within the Unincorporated County. For the purpose of expenditure budget allocation, total employees within the Unincorporated County (as estimated by ESRI) are multiplied by an equivalency factor of 0.5 to arrive at a number of equivalent residents to be considered along with actual County residents as the service population for County expenditures. General government / administration expenditures are estimated as a percentage of other expenditures

The analyses, projections, assumptions, rates of return, and any examples presented herein are for illustrative purposes and are not a guarantee of actual and/or future results. Project pro forma and tax analyses are projections only. Actual results may differ materially from those expressed in this analysis.

evaluated, consistent with allocations within the County Fiscal Year 2014-15 Adopted Budget (see Appendices G-I).

3.2.5 "Case Study" Expenditures

Recurring transportation (road maintenance) and flood control (storm drain maintenance) expenditures are estimated on a case-study basis, utilizing cost estimates provided by County Staff (adjusted slightly upward for inflation), additionally supported by public works estimates within nearby Riverside County cities (see Appendix J).

3.3 IMPLAN Modeling

This Analysis uses the IMPLAN (IMpact analysis for PLANning) econometric input/output model developed by the Minnesota IMPLAN Group to quantify the economic impact to the local region from Project construction and ongoing operation. This proprietary model estimates the economic benefits on the industries in a given geographic area based on known economic inputs, such as construction costs. The model estimates direct, indirect, and induced benefits expressed in terms of job creation, earnings ("labor income"), and increased economic activity ("output"). Output is defined by IMPLAN as total sales for service industries. For manufacturers, output is equal to sales plus/minus change in inventory. For retail and wholesale trade, output is equal to gross margin (see Appendices M-P).

Direct benefits refer to the initial changes in total economic output, labor income, and employment resulting from expenditures and/or production value changes. Examples of direct benefits include expenditures made for construction activities and the permanent on-site jobs created within the Project.

Indirect benefits result from the purchases made in response to development and operation by the industries that supply required goods and services. Indirect benefits occur in industries indirectly affected by the construction and ongoing operation, such as manufacturing and wholesale trade services.

Induced benefits are the changes in local spending by households employed directly or indirectly in affected industry sectors and the resultant economic activity as a result of construction and ongoing employee spending.

Direct, indirect, and induced benefits are estimated for the County. For reference only, it is estimated that 10% of indirect and induced benefits are estimated to be captured within the nearby City of Calimesa.

3.4 Permanent On-Site Jobs

Permanent on-site jobs are approximated based on Project square footage as estimated by Client and standard employee-per-square-foot assumptions as estimated by the Southern California Association of Governments ("SCAG") (see Appendix F).

4.0 Fiscal and Economic Impacts

4.1 Annual Primary Fiscal Impacts

The Project is estimated to generate approximately $463,300 annually in primary County fiscal revenues and approximately $212,100 in primary fiscal expenditures, yielding an annual net fiscal impact of approximately $251,200. The 30-year present value of the net fiscal impact generated by the Project (discounted at 6.0%) is approximately $3.9 million. To calculate the present value of future fiscal impacts, property tax and property tax in-lieu of VLF revenues were escalated annually using a 2.0% growth factor (lesser of Prop 13 statutory maximum and 10-30 year average growth for California Consumer Price Index). Sales and use tax revenues and fiscal expenditure sources were escalated using a 3.0% growth factor. Table 4.1 summarizes the primary fiscal impacts from the Project. Appendices A-K provide calculation detail by fiscal revenue ad expenditure category.

Table 4.1: Summary of Primary Fiscal Impacts

	Estimated Annual Total	Estimated Annual Growth	30-Year Nominal Total	30-Year Present Value
Primary Fiscal Revenues				
Property Tax (Secured and Unsecured)	$317,300	2.0%	$12,872,300	$5,430,800
Property Tax In-Lieu of VLF	$99,100	2.0%	$4,020,300	$1,696,200
Sales & Use Tax	$46,900	3.0%	$2,231,300	$902,700
Estimated Primary Fiscal Revenues	**$463,300**		**$19,123,900**	**$8,029,700**
Primary Fiscal Expenditures				
Sheriff	$144,300	3.0%	$6,865,100	$2,777,200
Fire Protection	$30,000	3.0%	$1,427,300	$577,400
Transportation (Roadways)	$17,400	3.0%	$827,800	$334,900
Flood Control (Storm Drains)	$1,300	3.0%	$61,800	$25,000
Geneveral Government / Admin	$19,100	3.0%	$908,700	$367,600
Estimated Primary Fiscal Expenditures	**$212,100**		**$10,090,700**	**$4,082,100**
Estimated Net Fiscal Impact	**$251,200**		**$9,033,200**	**$3,947,600**
Revenue/Cost Ratio	*2.18*		*1.90*	*1.97*

Note: 30-Year projections upon full Project build-out and stabilization (2015 dollars)

4.2 Economic Benefits from Project Construction

Project construction-related expenditures are estimated to generate approximately 577 jobs, approximately $28.8 million in labor income, and approximately $67.5 billion in economic output through direct, indirect, and induced economic activity. Table 4.2 summarizes the economic benefits from construction-related activities. The full range of benefits by industry category is provided in Appendices M-N.

Table 4.2: Summary of Economic Benefits from Project Construction

Economic Benefits from Construction

Impact Type	Employment	Labor Income	Output
Direct Effect	400	$21,640,336	$46,200,000
Indirect Effect	73	$3,198,574	$9,049,938
Induced Effect	104	$3,998,238	$12,295,421
Total Countywide	**577**	**$28,837,148**	**$67,545,360**
Estimated Calimesa Capture	18	$719,681	$2,134,536

Notes: Cumulative impacts during construction period. Values in 2015 dollars.

4.3 Economic Benefits from Ongoing Operations

Ongoing operation of the Project is estimated to generate approximately 748 jobs (including 507 permanent on-site full-time equivalent or "FTE" jobs and 241 off-site indirect and induced jobs), $31.9 million in annual labor income, and $67.9 million in annual economic output (includes approximately $42.6 million in direct on-site output and approximately $25.4 million in off-site indirect and induced industry output). Table 4.3 summarizes the economic benefits from ongoing operation of the Project. The full range of benefits by industry category is provided in Appendices O-P.

The analyses, projections, assumptions, rates of return, and any examples presented herein are for illustrative purposes and are not a guarantee of actual and/or future results. Project pro forma and tax analyses are projections only. Actual results may differ materially from those expressed in this analysis.

Table 4.3: Summary of Economic Benefits from Ongoing Operations

Economic Benefits from Ongoing Operation

Impact Type	Employment	Labor Income	Output

Appendix E: Sales and Use Tax (Off-Site / Indirect)

Estimated Annual Taxable Spending / Empl.		$14,100
Estimated # Employees		507
Total Employee Taxable Spending		$7,143,060
Estimated Capture within Unincorporated County	10%	$714,306
Estimated Capture within Incorporated County	40%	$2,857,224
Estimated Total Capture within County	50%	$3,571,530
Distribution to County (only sales w/in Unincorporated County	1.0%	$7,143
Special Distribution to RCTC*	0.5%	$17,858
Public Safety (Prop 172) Sales Tax Distribution	0.5%	$17,858
County Share of Public Safety Sales Tax	95.5%	$17,054
Total County Sales Tax Distribution		$42,055
Projected Use Tax as % of Sales Tax	11.5%	$4,836
Annual Sales & Use Tax to County (Off-Site / Indirect)		**$46,900**

*** RCTC** = Riverside County Transportation Commission (distribution to continue at least until 2039)

Notes: 1.00% sales tax rate includes 0.25% "Triple Flip" apportionment detailed below. All amounts in 2015 dollars.

Triple Flip: In March 2004, California voters approved Proposition 57, which authorized the issuance of $15 billion in bonds to finance a portion of the State's budget deficit and a swap of one-quarter of local sales taxes (0.25%) for an equal amount of "in-lieu" sales taxes to be funded from property tax revenues, specifically, the Educational Revenue Augmentation Fund ("ERAF").

Pubic Safety (Prop 172) Sales Tax: Effective January 1, 1994, the State collects a 0.5% sales tax and dedicates the revenue for local public safety activities (e.g., sheriff/police, fire protection, county district attorney, county corrections). The State apportions the Prop 172 revenue to each county based on its proportionate share of statewide taxable sales. In most recent fiscal years, the County average share of the total 0.5% Prop 172 sales tax collected within the County is approximately 95.5%

Economic Impact of Gateway Distribution Center

John E. Husing, Ph.D.

Project Description and Location. Gateway Distribution Center will have 2,552,206 square feet of industrial space comprised of two high cube logistics facilities of roughly 1,600,000 square feet and 960,000 square feet. The project is located on approximately 228 acres near the intersection of Cherry Valley Blvd. and Roberts Street (*a dirt road*) in unincorporated Riverside County adjacent to the City of Calimesa. The site is 0.4 miles from access to the I-10 freeway along Cherry Valley Blvd. (*see map: front cover*)

There is already a precedent for high volume economic activity in the immediate area:

- Directly south of the project site along Cherry Valley Blvd. is the now defunct Sunny Cal Chicken Ranch. According to Images of Cherry Valley, "the processing plant at this facility was capable of processing 500 cases of eggs per hour, each containing 30 dozen eggs … The ranch originally contained 100 chicken houses, which were 400 feet long, and contained 15,000 birds each "[1]

Truck repair activity is located very near the project site:

- Luther's Truck and Equipment is roughly 500 yards away along Cherry Valley Blvd. on the short route from the proposed center to the I-10 freeway. It was established in 1995 and incorporated in California. According to the Manta website "current estimates show this company has an annual revenue of $1 to 2.5 million and employs a staff of approximately 10 to 19."[2]

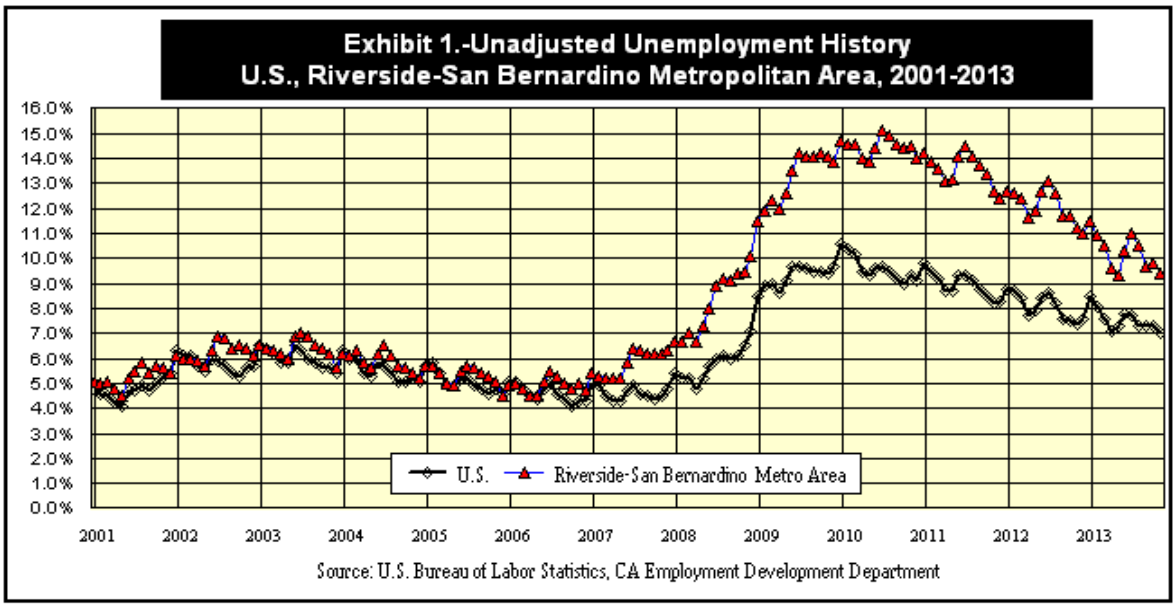
Rancho Calimesa Mobile Home Park:

- The only residential property of any size near the proposed site is the Rancho Calimesa Mobile Home Park located on Calimesa Blvd. directly across the road from the I-10 freeway. It is 0.4 miles northwest of Cherry Valley Blvd. It has approximately 120 units.

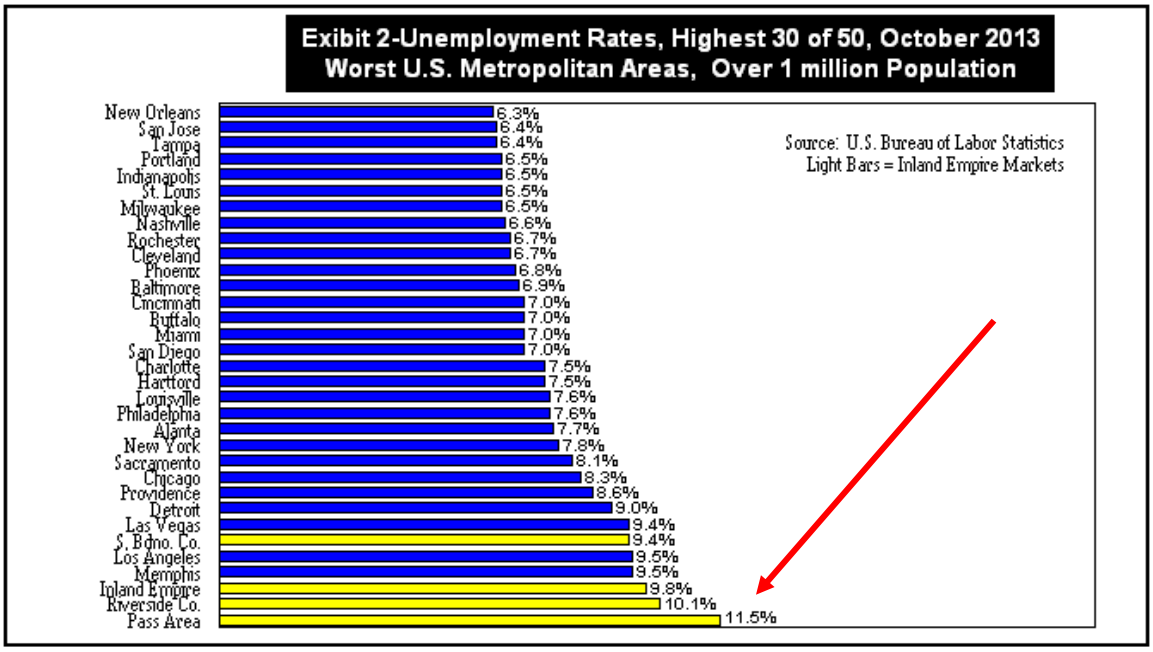
Economic Context. To truly understand the importance of projects like the Gateway Distribution Center, it is necessary to consider the operation within the context of the economies of the Inland Empire and Riverside County where it is located. This starts with unemployment trends. From 2001-2007, the inland area's unemployment rate closely tracked the national level. However starting in 2008, they deviated substantially with the U.S. rate rising rapidly to as high as 10.6% but the Inland Empire's rate exploding to 15.0%. Since these peaks, the inland area's unemployment has remained far above the national level, even as the economy has seen slow improvement at the national and regional levels (*Exhibit 1*).

[1] Images of Cherry Valley, Kenneth Holtzclaw and Tom Chong, 2008, pgs. 23-24

[2] www.manta.com/c/mm4g4jl/luther-s-truck-equipment



As a result, by October 2013, there were 50 metropolitan areas within the U.S. with one million or more people. Of those, the highest unemployment rate was in the Inland Empire at 9.8%. Riverside County had the highest rate of the region's two counties at 10.1%, down from a peak of 15.2% in mid-2010. San Bernardino County's rate was 9.4%. For the Calimesa-Cabazon area, unemployment has been particularly significant. Its rate was **11.5%** in October 2013 down from 17.6% in mid-2010. Job creation is thus vitally important for the inland area, the county and the Pass Area where the Gateway Distribution Center is proposed (*Exhibit 2*).



An important goal for the Pass Area of Riverside County is the creation of good paying jobs close to where people are living. The difficulty faced by the area is seen in several indicators:

- **56.3 minutes** is the average round trip commute time for employees living in the area. According to the 2012 Census Bureau's American Community Survey.
- **0.598** is the jobs:housing ratio for the Pass area. That is the measure of the availability of local jobs for each occupied home in a community. The Pass Area is far below the 1.102 ratio for the Inland Empire or the 1.168 ratio for all of Southern California.
- **$31,466** is the average annual pay for jobs located in the Pass Area in fourth quarter 2012. That was -20.7% below the $39,676 average for Riverside County.

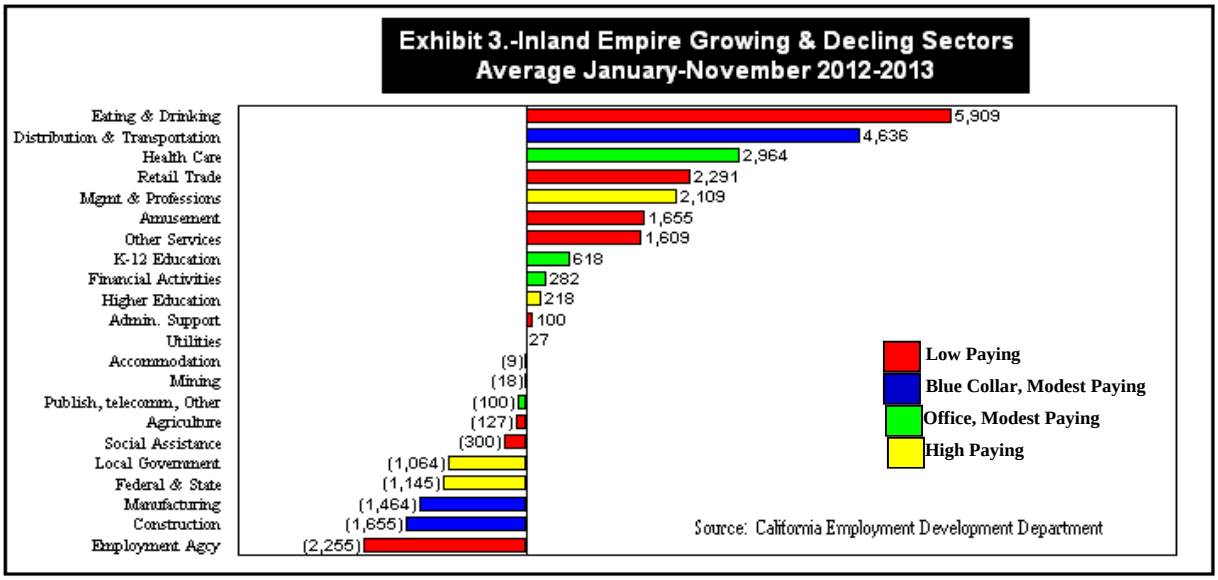
Stages of Growth. These data are not a surprise given that the Pass Area is going through Stage #1 of the three stage growth process that always affects the edge communities of Southern California. In this stage, the density of residential building elsewhere forces home builders into the next area with undeveloped land. This phenomenon reached the Pass Area in the last decade. It brought a lot of people, followed by the growth of lower paying population-serving jobs in sectors like retailing and consumer services. This means the area sees long commutes, a job base that has not caught up with the population growth and the need for higher paying local jobs not dependent on local consumers.

Stage #2 in the process occurs when industrial employers face the same dilemma that housing builders faced earlier. In this stage, the density of facilities located elsewhere reaches a point where regional, national and international firms need to move outward to find space for their operations. As they come, the job base they bring leads to declining blue collar commute times, rising jobs:housing ratios and rising annual average pay levels. That is what projects like the Gateway Distribution Center represent for the Pass Area. Over time, this stage raises the success of the local economy. For instance, Stage #2 has been completed in San Bernardino County's Westend. There, the jobs:housing ratio is 1.376 and the average annual pay is $39,177.

Stage #3 in the final stage in the maturing process. It occurs when better educated workers move into an area and office jobs start to follow them. This has begun in the Westend market. There, the better educated workers have moved in but their jobs have not moved as yet. That is why the average commute time is 63.4 minutes as most of the area's commuters are professionals and office workers going to the coastal counties.

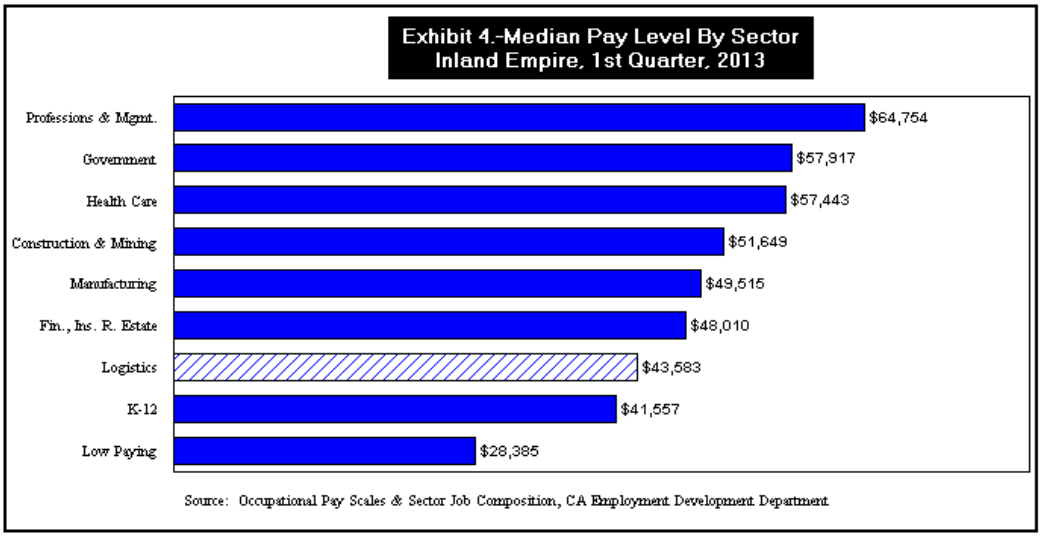
Gateway Distribution Center & The Importance of Logistics Jobs. Given this employment context, there are several aspects of the distribution and transportation sector (*logistics*) of which the Gateway Distribution Center would be a part that are of great importance to the community:

1. With the Inland Empire vitally in need of jobs, the logistics sector is playing a key role in creating local jobs. According to the CA Employment Development Department (*EDD*) from January-November 2013, the inland area added 14,282 jobs (*Exhibit 3*). Of these, 4,636 were in the logistics group. That represents **32.5%** of all new jobs created.



Put another way, in the major metropolitan area with the nation's highest unemployment rate throughout 2013, the logistics sector has been responsible for 1 of every 3 new jobs.

2. Using EDD data on the array of occupations in the logistics sector, weighted by the number of workers in each of the sector's occupations, the median pay level was **$43,583** in first quarter 2013 (*Exhibit 4*). If a person enters the sector and moves up to positions where half the workers in the industry earn more and half make less, this is the income they would earn. If a family had a second wage-earner at the median of $28,385 in the combined low paying sectors (*e.g., restaurant, hotel, retail*), it would have a combined income of $71,968 and be part of the middle class.



Here, it should be noted that the median cost of shelter in the Inland Empire, as measured by the U.S. Census Bureau's American Community Survey for rentals and homeownership weighted by the number a households in each, had a median cost of $1,299 a month. That was -36.6% less than the $2,051 for the rest of Southern

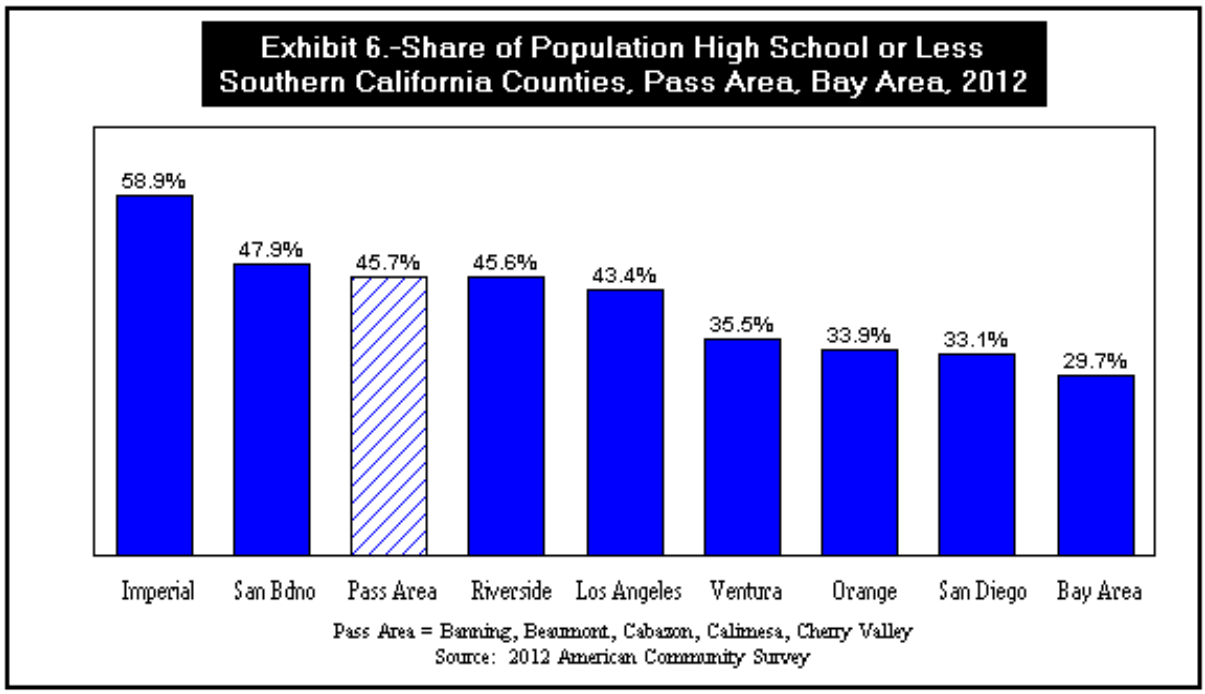
California. According to the U.S. Bureau of Labor Statistics, shelter costs represent 36.3% of a typical household's budget. If prices for all other items are the same, this would means that the same income buys 13.3% more in Riverside County or San Bernardino counties. A $43,583 median income in the inland counties would be the equivalent of **$49,376** in the rest of Southern California.

3. An important difficulty for the Inland Empire is the very large share of its adult population that has a high school or less education (*Exhibit 5*). This makes it necessary to have job growth that can both put residents within reach of middle class incomes while not having serious education barriers to employment.

   Again, EDD provides both the numbers of workers in each occupation in each sector and the educational requirements for those occupations. For the logistics sector of which the Gateway Distribution Center would be a part, **83.0%** of all current employees have jobs requiring a high school or less education (*Exhibit 5*).

   Given that the median income of $43,583 in logistics is the level with 50% of the workers earning more and 50% less, the fact that 83.0% of all workers in the sector are only required to have high school or less educations means that a significant share of those earning the median income or higher are not well educated. The sector has given them a chance to put their families within reach of the middle class.

4. Given the relatively high median incomes earned by workers in the logistics sector and the fact that a huge percentage of workers in the sector have high school or less educations, means that these workers have had the chance to advance in income thanks to on the job learning and movement up skill ladders to ever more responsibility, technical competence and income.



5. The importance of these attributes of the logistics sectors to the Gateway Distribution Center project is seen in data from the U.S. Census Bureau's 2012 American Community Survey. It showed that **45.7%** of Pass Area adults had a high school or less education. It was 45.6% in Riverside County. Among Southern California and Bay Area counties, only Imperial and San Bernardino had higher shares (*Exhibit 5*). A huge share of local adults thus need access to the types of jobs and the skill ladders that logistics offers.

To summarize, the logistic sector of which Gateway Distribution Center would be a part is providing job opportunities of a kind needed by a very significant share of the adults in the Pass Area and Riverside County. That is the case given the high unemployment levels, significant commute times, low jobs:housing ratios, the modes educational levels of local workers and the low average pay levels of local firms. The logistics sector's importance is seen in four facts:

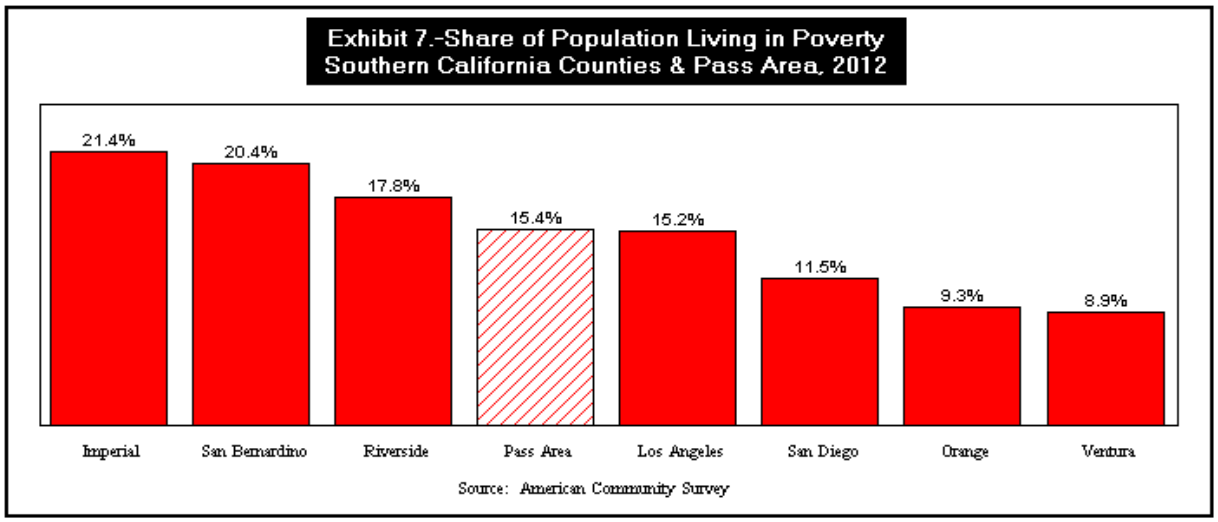
- The sector is growing rapidly (*32.7% of inland job growth*).
- Logistics has a median income (*$43,583*) that puts families within reach of the middle class.
- Most logistics workers (*83.0%*) are in jobs that require a high school diploma or less.
- The sector provides workers on the job learning and skill ladders up which marginally educated employees can advance toward a higher median income level.

Public Health, Job Growth & Logistics. Any consideration of a facility like the Gateway Distribution Center must address the issue of public health. Here, research by the collaboration of the Robert Woods Johnson Foundation and University of Wisconsin School of Public Health

is important as its aim was to determine the importance of the various determinants of public health. They use the results of this research in their annual ranking of the public health of the nation's counties.[3] The relative importance of the various factors was:[4]

- Socio-Economics (*e.g., unemployment, poverty, educational attainment*) 40%
- Population Health Behaviors (e.g., *smoking, inactivity, obesity*) 30%
- Access To Medical Care (*e.g., uninsured, few primary care doctors, screening*) 20%
- Environmental Factors (*e.g., particulate exposure, access to clean water*) 10%

The key role of socioeconomics to public health underscores the importance of bringing down the very high unemployment levels in the Pass Area and Riverside County (*Exhibits 1 & 5*). It also places emphasis on reducing the share of people living in poverty. For all people, this was 17.8% in Riverside County and 15.4% for the Pass Area. These are higher levels than for any of Southern California's coastal counties (*Exhibit 7*).



In Riverside County, the increase in poverty between 1990 and 2012 has been extreme:

- 95% was the county's population growth in this period
- 200% was the increase in the number living below the federal poverty line
    - 131,690 people were poor in 1990
    - 394,650 people were poor in 2012
    - 292,690 more people fell into poverty from 1990-2012

For those concerned with the Inland Empire's public health, the combination of these difficulties emphasizes the need for job creation that can move marginally educated families out of poverty and into the middle class. Projects like the Gateway Distribution Center that facilitate the

[3] County Health Rankings & Road Maps, A Healthier Nation County by County, California, 2013

logistics sector's job growth are a key part of any such strategy. Supporting the priority that needs to be placed on job growth in sectors proving upward mobility through on the job learning was a major outreach effort by the Community Vital Signs project in San Bernardino County:

> "Over 1,000 leaders from business, education, public safety, health and human services, faith and community organizations, transportation and planning came together to make plans for improving health and wellness in the community." [5] [*underlining added*]

The results of this massive outreach effort are seen in its final report:

> "Education, economy and access to healthcare hold the key to a healthier future for the County of San Bernardino, according to a report from Community Vital Signs released at its "Live Well, Age Well" Summit at the National Orange Show in San Bernardino on Thursday, November 14, 2013."[6] [*underlining added*].

Interesting by its absence from the list of seven priorities created by this process was any reference to air quality. This is likely due to the success of past efforts to clean-up the air.

Public Health, Air Quality & Logistics. Despite expert opinion and broad leadership views about the key importance of job growth and lowering poverty to address public health, pressure by the South Coast Air Quality Management District (*AQMD*), NIMBYs and allied groups has forced most hearings and discussions of the Inland Empire's economy to focus on environmental rather than employment issues. This has occurred even though achieving the next iteration of air quality is not a central priority for public health professionals concerned about the region.

[6] Ibid

The anomaly of the air quality issue having such prominence is seen in the clash of two facts:

- From 2001-2012, there has been an increase of 229,967,544 square feet of occupied industrial space in the Inland Empire, mostly taken by distribution and trucking firms.
- At the same time, the CA Air Resources Board's inland monitoring stations show that the number of days that the $PM^{2.5}$ pollutants most associated with truck traffic have exceeded federal standards has fallen to zero or is approaching it (*Exhibit 8*):
  - **88.9** (*2002*) to **0.0** (*2012*) next to the BNSF yards in San Bernardino (*-100.0%*)
  - **79.5** (*2001*) to **0.0** *(2012*) in the midst of Ontario's huge warehousing area (*-100.0%*)
  - **120.2** (*2001*) to **7.0** (*2012*) in Rubidoux next to the SR-60 freeway (*-94.2%*)
  - **46.2** (*2006*) to **7.0** (*2012*) in Mira Loma along the SR-60 and I-15 (*39.2%*)
  - **88.4** (*2002*) to **7.1** (*2011*) in Riverside's Magnolia area (*-62.0%*)
  - **73.7** (*2002*) to **10.6** (*2012*) in Fontana despite wind borne desert particles (*-85.6%*)

The likely reason for this vast improvement is the dramatic increase in the use of clean diesel and the start of the use of LNG engines on trucks and trains.

With $PM^{2.5}$ problems having declined dramatically, AQMD has largely stopped mentioning it and is now focused on ozone. Again, despite the huge increase in the Inland Empire's warehousing activity, the days that ozone is over the California standard have plunged significantly, though the problem is not as close to being eliminated as with $PM^{2.5}$ (*Exhibit 9*). This includes a decline of -46.7% at the Banning Airport monitoring station. In fact, Banning stations have seen a -69.0% decline in problem days since the peak of 129 days in 1973.

Given that the trends in both $PM^{2.5}$ and ozone pollution are sharply downward and that air quality is no longer a primary concern of the Inland Empire's public health professionals, the

question arises as to why AQMD is now aggressively pushing to accelerate the pace of air quality improvements. This is an issue of importance since the agency has indicated that accomplishing this objective will require reducing the expansion of logistics activity in the inland region. The agency wishes to accomplish this despite the fact that it is the one local sector providing serious job growth that also has a relatively high median income and offers numerous marginally educated workers a path out of poverty. The answer appears to lie in the agency's needs versus those of the Inland Empire's public health:

- Under U.S. Environmental Protection Agency (*EPA*) mandates, AQMD can only achieve air quality conformity if it speeds-up the decline in ozone regardless of its impact on local employment and poverty.
- For local Inland Empire officials, the issue is not a lack of commitment to seeing air quality improve. Rather, it is whether they want the pace at which that occurs to have a major impact on local job creation at a time when the region's poverty and unemployment are among the worst in the country.

Projects like the Gateway Distribution Center with its myriad of positive economic impacts thus bring focus to a crucial issue of regulatory balance and whether area officials should be questioning regulatory timelines that create unintended but severe consequences for local families that are least able to afford them.

Gateway Distribution Center – Direct Job Creation. Looking at the specific economic impact of the logistics sector, there are three separate scenarios concerning the level of direct job creation from adding 2,552,206 square feet of logistics space. These depend upon the ultimate tenants that occupy the space.

- **Conventional Warehousing.** A conventional warehousing operation would receive international cargo from the ports of Los Angeles and Long Beach or domestic cargo originating in Southern California or elsewhere in the county. Cargo would ultimately leave the facility bound for outlets in Southern California or regional distribution hubs throughout the country. Inside the facility, a variety of activities might take place. This can include simply storing the goods or sorting them so specific combinations can ultimately be assembled to meet orders from stores or regional hubs. Items from various places in the world might be assembled into final products or boxed together in combined packages. Often such operations have small retail operations co-located on-site. Workers in conventional facilities would employ some information technology in their work, but they would not be considered highly automated.

  Operations of this type can have a wide range of estimates of square feet of space per workers. For instance, Beacon Economics roughly estimates it at 1,650 square feet per worker. This analyst has typically used 3,000 square feet per job based upon tracking employment at warehousing operations in the Inland Empire.

Using the 3,000 square foot assumption, 2,552,206 square feet of new space would conservatively generate **841 direct new logistics jobs** at the Gateway Distribution complex.

- **High Technology Warehousing.** The difference between conventional warehousing and a high technology warehousing is the enormous amount of capital equipment and information technology installed to handle operations. This can be seen in the value of the trade fixtures in different facilities. For example, the Walgren's distribution center in Moreno Valley is regarded as a high technology facility. It has trade fixtures valued at $59.89 per square foot. That is 72.1% more than the $34.80 per square foot for trade fixtures at the more conventional Ross distribution center in nearby Perris.

  Operations of this type are relatively new and can have a wide range of estimates for workers per square foot. Kosmont Companies uses 3,600 square feet per job based upon work from the Southern California Association of Governments. This analyst has analyzed facilities of this type at 3,250 square feet per job.

  Using the Kosmont assumption, 2,552,206 square feet of new space with a high technology tenant would generate **701 direct new logistics jobs** at the Gateway Distribution complex.[7]

  A second characteristic of such facilities is that they pay more than other forms of warehousing because the workers need to be able to work with and/or maintain much more sophisticated equipment. A 25% premium is thus applied to labor force earnings.

- **Fulfillment Center.** The newest trend in logistics operations are fulfillment centers. These facilities receive a huge variety of consumer goods from around the country and around the world. They are then sorted and stored. They are sent to customers who largely order them on-line. The goal of these centers is 24 hour delivery. The work in them is more labor intensive than in other forms of warehousing.

  In the Inland Empire, the most highly publicized fulfillment centers have been the 950,000 square foot Amazon.com facility in San Bernardino and the announced 1,000,000 square foot operation that will be built in Moreno Valley. Interestingly, of the 17 logistics facilities looking for locations in the Inland Empire in first quarter 2013, Jones LaSalle found that seven were fulfillment operations from firms as diverse as Nordstrom's, Dollar Tree, Best Buy and Kohl's.[8]

  Looking at the square feet per permanent worker in these types of facilities, several are known:

  - Amazon's San Bernardino 950,000 square foot operation employs 1,400 workers or **679** square feet per worker.

[7] I-10 Gateway Distribution Center Project, Gross Fiscal Impact and Economic Benefit Analysis, July 2013

[8] Marketing Activity on the Move, Jones LaSalle, Ontario, 2012-2013

- Macy's is building a 1,300,00 square foot facility in Oklahoma with 1,500 workers or **867** square feet per worker.
- Macy's has a 1,300,00 square foot facility in West Virginia with 1,200 workers or **1,083** square feet per worker.
- Amazon's Moreno Valley will be a 1,200,000 square facility with 1,000 workers or **1,200** square feet per worker.
- Kohl's San Bernardino outlet is 951,000 square feet with 500 workers or **1,902** square feet per worker.

In addition to these jobs, each of these facilities adds seasonal workers during holiday seasons. For instance, Kohl's has added 1,700 such workers for the 2013 Christmas season. Interestingly, the square footage per worker in fulfillment centers is equal to or less than the 1,039 square feet per job found in manufacturing.

Based upon these operations, a relatively conservative assumption of 1,100 square feet per permanent fulfillment center job would appear reasonable. Seasonal workers are omitted from the calculation. Using that assumption, a Gateway Distribution complex with 2,552,206 square foot of fulfillment tenants would generate **2,293 direct new logistics jobs.**

Gateway Distribution Center – Secondary & Total Job Creation. When a logistics operation opens in local market, it supplies direct jobs at the facility as outlined. When the money spent by the business and its employees circulates through the local economy, it creates additional economic activity and employment. This is analogous to a gold mining town in the Old West. There, the miners dug up gold and sent it away bringing fresh money into the town. That supported the miners who represented the direct jobs. When the mining companies or miners spent those same dollars at the local general store or saloon, those operations and their workers were also supported. They represent a secondary tier of economic impact also set off by the gold mines.

To estimate the secondary tier of employment and total employment of the three different scenarios for the Gateway Distribution Center, the standard approach is to use an econometric model called IMPLAN designed to provide that information.[9] The market area used for the analysis was Riverside County:

- **Conventional Warehousing.** The 841 direct jobs led to another 564 secondary jobs for a total permanent employment impact of **1,405**.
- **High Technology Warehousing.** The 701 direct jobs led to another 520 secondary jobs for a total permanent employment impact of **1,222**.

[9] IMpacts for PLANning, version 3.1.1001.12 copyright 2013, IMPLAN Group LLC

- **Fulfillment Center.** The 2,293 direct jobs led to another 1,537 secondary jobs for a total permanent employment impact of **3,830**.

Gateway Distribution Center – Direct, Secondary & Total Income Creation. Implan modeling also shows the direct, secondary and total labor income generated by the operation of the three types of uses for the Gateway Distribution Center:

- **Conventional Warehousing.** $51.8 million in direct labor income would be created leading to another $25.3 million in secondary labor income for a total labor income impact of **$77.1 million**.
- **High Technology Warehousing.** $52.8 million in direct labor income would be created leading to another $23.3 million in secondary labor income for a total labor income impact of **$76.1 million**.
- **Fulfillment Center.** $141.2 million in direct labor income would be created leading to another $69.0 million in secondary labor income for a total labor income impact of **$210.1 million**.

Gateway Distribution Center – Direct, Secondary & Total Economy Activity Creation. Implan modeling also shows the direct, secondary and total economic activity generated by the operation of the three types of uses for the Gateway Distribution Center:

- **Conventional Warehousing.** $79.4 million in net new economic activity (*value added*) would be generated leading to another $44.8 million in secondary labor income for a total increase in economic activity of **$124.2 million**.
- **High Technology Warehousing.** $75.8 million in net new economic activity (*value added*) would be generated leading to another $41.4 million in secondary labor income for a total increase in economic activity of **$117.2 million**.
- **Fulfillment Center.** $216.5 million in net new economic activity (*value added*) would be generated leading to another $122.1 million in secondary labor income for a total labor income impact of **$338.6 million**.

Gateway Distribution Center – Other. Two other impacts of the Gateway Distribution Center project are of importance. Specifically, these are the economic impact during the construction of the project, and the impact of the facility on the tax revenues of local governments. In both case, Kosmont Companies has done a thorough analysis of these impacts and their July 2013 report should be referenced:

I-10 Distribution Center, Gross Fiscal Impact and Economic Benefits Analysis

Summary of Economic Impacts. Altogether, the direct and secondary impacts of the Gateway Distribution Center on job creation, increased labor income and growth in the Riverside County economy are summarized in Exhibit 10.

Exhibit 10.-Economic Impact of Gateway Distribution Center, By Type of Tenant

	Employment	Labor Income	Net Output (Value Added)
Conventional Warehouse			
Direct Impact	841	$51,779,113	$79,388,608
Secondary Impact	564	$25,286,985	$44,785,989
Total Impact	**1,405**	**$77,066,098**	**$124,174,598**
High Tech Warehouse			
Direct Impact	701	$52,816,956	$75,827,433
Secondary Impact	520	$23,275,112	$41,407,991
Total Impact	**1,221**	**$76,092,068**	**$117,235,424**
Fulfillment Center			
Direct Impact	2,293	$141,190,276	$216,498,160
Secondary Impact	1,537	$68,957,148	$122,128,753
Total Impact	**3,830**	**$210,147,424**	**$338,626,913**
