GREGG DRILLING AND TESTING, INC.
GREGG IN SITU, INC.
ENVIRONMENTAL AND GEOTECHNICAL INVESTIGATION SERVICES

July 5, 2005

CHJ
Attn: Terrance Davis
1355 E. Cooley Dr.
Colton, California 92324

Subject: CPT Site Investigation
Cherry Valley Blvd & Roberts Ave
Cherry Valley, California
GREGG Project Number: 05-173SH

Dear Mr. Davis:

The following report presents the results of GREGG IN SITU's Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☐
3	Seismic Cone Penetration Tests	(SCPTU)	☐
4	Resistivity Cone Penetration Tests	(RCPTU)	☐
5	UVIF Cone Penetration Tests	(UVIFCPTU)	☐
6	Groundwater Sampling	(GWS)	☐
7	Soil Sampling	(SS)	☐
8	Vapor Sampling	(VS)	☐
9	Vane Shear Testing	(VST)	☐
10	SPT Energy Calibration	(SPTE)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact our office at (562) 427-6899.

Sincerely,
GREGG IN SITU, INC.

Brian Savela

Cone Penetration Test Data & Interpretation

Soil behavior type and stratigraphic interpretation is based on relationships between cone bearing (q_c), sleeve friction (f_s), and pore water pressure (u_2). The friction ratio (R_f) is a calculated parameter defined by $100f_s/q_c$ and is used to infer soil behavior type. Generally:

Cohesive soils (clays)

- High friction ratio (R_f) due to small cone bearing (q_c)
- Generate large excess pore water pressures (u_2)

Cohesionless soils (sands)

- Low friction ratio (R_f) due to large cone bearing (q_c)
- Generate very little excess pore water pressures (u_2)

A complete set of baseline readings are taken prior to and at the completion of each sounding to determine temperature shifts and any zero load offsets. Corrections for temperature shifts and zero load offsets can be extremely important, especially when the recorded loads are relatively small. In sandy soils, however, these corrections are generally negligible.

The cone penetration test data collected from your site is presented in graphical form in Appendix CPT. The data includes CPT logs of measured soil parameters, computer calculations of interpreted soil behavior types (SBT), and additional geotechnical parameters. A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Soil interpretation for this project was conducted using recent correlations developed by Robertson et al, 1990, *Figure SBT*. Note that it is not always possible to clearly identify a soil type based solely on q_c, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the soil behavior type.

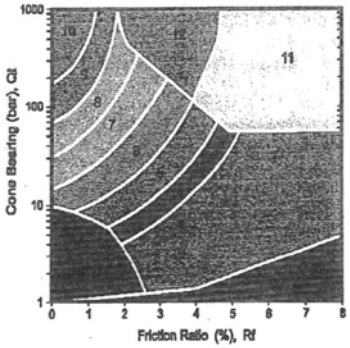

Figure SBT

ZONE	Qt/N	SBT
1	2	Sensitive, fine grained
2	1	Organic materials
3	1	Clay
4	1.5	Silty clay to clay
5	2	Clayey silt to silty clay
6	2.5	Sandy silt to clayey silt
7	3	Silty sand to sandy silt
8	4	Sand to silty sand
9	5	Sand
10	6	Gravely sand to sand
11	1	Very stiff fine grained*
12	2	Sand to clayey sand*

*over consolidated or cemented

LABORATORY TEST PROCEDURES AND RESULTS

The samples obtained during the field investigation were transported to the laboratory for testing and analysis. The results of tests performed on selected samples, including the test procedures are summarized below. The laboratory testing program consisted of the following:

Soil Classification

The soil samples obtained from the borings and test pits were visually classified in accordance with the Unified Soil Classification System. The soil classifications are shown in the Logs of borings (Appendix II).

In-Place Moisture Content and Density

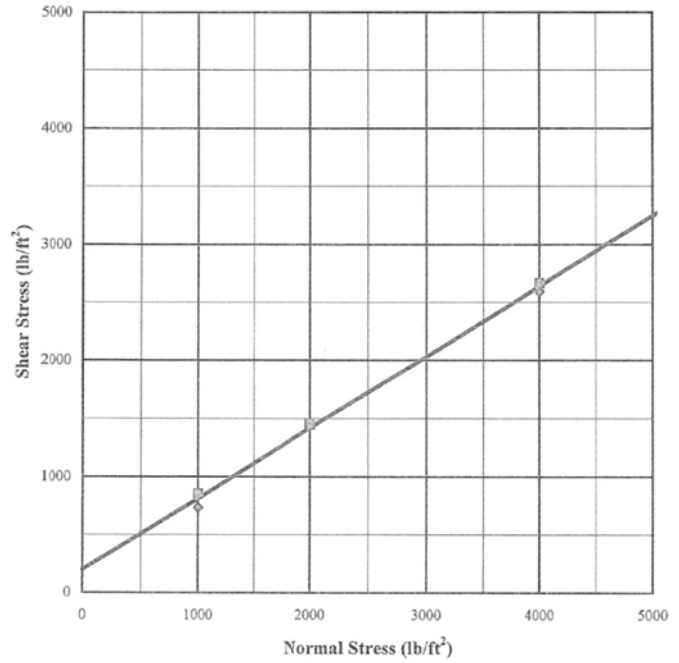
Representative relatively undisturbed and bulk samples of the sub-surface materials were tested to determine their in-place moisture content, in accordance with ASTM: D 2922 and ASTM D 2974-87 Test Methods. The in-place density of relatively undisturbed soil samples were calculated based on the moisture content and direct volume measurement. The test results are shown on the Logs of Borings (Appendix II).

Grain Size

Selected soil samples were tested in accordance with ASTM: D 442 to determine soil particle size as an aid in classification of soil types. The test results are presented in Plate III-1 through III-3

Maximum Dry Density and Optimum Moisture Content

Maximum dry density and optimum moisture content tests were performed on representative bulk soil samples in accordance with ASTM: D 1557. The results are shown in Table III-1.



Direct Shear Test Data For Compacted Fill
(Remolded Sample to 90% R.C - Ultimate)

Project No: 665-000-01
Date : April 3 2009
Plate III-14

Noblett & Associates

CVAR_09754

Expansion Index

Representative bulk soil samples were tested for expansion potential following the UBC Standard 18-2 and classified in accordance with UBC 18-I-B. Test results are presented in the following Table III-3.

Table III-3

Location	Expansion Index	Expansion Potential (UBC 29-2)
HS-2 @ 34 ft	12	Very Low
HS-3@ 7 ft	8	Very Low

Table III-1

Location	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
HS-2 @ 34 ft	137.0	8.0
HS-3@ 7 ft	132.5	8.5

Consolidation

Consolidation tests were performed on remolded samples of the sub-surface materials to determine the compressibility characteristics. The test specimens were soaked prior to the tests to simulate possible adverse field conditions. The test results are presented on Plates III-4 through III-13.

Direct Shear

Direct shear tests were performed on remolded samples of the subsurface materials with a direct shear machine of the strain-controlled type in which the rate of strain is 0.01 inches per minute. The remolded samples were compacted to 90 percent relative compaction (ASTM: D1557). Each sample was soaked in a confined state prior to shearing. Each sample was sheared under varied normal loads ranging from 1.0 ksf to 4.0 ksf. The test results are shown in composite plot on Plate III-.14

Sulfate Content

Selected bulk samples were tested for soluble sulfate content in accordance with the Hach method. The test results are shown in Table III-2.

Table III-2

Sample	Water Soluble Sulfate In Soil (Percentage by weight (%))	Sulfate Exposure (UBC Table 19-A-4)
HS-2 @ 34 ft	0.0029	Negligible
HS-3@ 7 ft	0.0031	Negligible

C.H.J., Inc.
TJG Cherry Valley
Your #04806-3, MJS&A #05-1044LAB
29-Jul-05

Sample ID			13	22
Resistivity		**Units**		
as-received		ohm-cm	20,000	11,000
saturated		ohm-cm	5,000	5,900
pH			7.0	7.0
Electrical				
Conductivity		mS/cm	0.10	0.10
Chemical Analyses				
Cations				
calcium	Ca^{2+}	mg/kg	52	40
magnesium	Mg^{2+}	mg/kg	27	39
sodium	Na^{1+}	mg/kg	ND	ND
Anions				
carbonate	CO_3^{2-}	mg/kg	ND	ND
bicarbonate	HCO_3^{1-}	mg/kg	113	113
chloride	Cl^{1-}	mg/kg	20	ND
sulfate	SO_4^{2-}	mg/kg	ND	57
Other Tests				
ammonium	NH_4^{1+}	mg/kg	na	na
nitrate	NO_3^{1-}	mg/kg	na	na
sulfide	S^{2-}	qual	na	na
Redox		mV	na	na

Electrical conductivity in millisiemens/cm and chemical analysis were made on a 1:5 soil-to-water extract.
mg/kg = milligrams per kilogram (parts per million) of dry soil.
Redox = oxidation-reduction potential in millivolts
ND = not detected
na = not analyzed

A Critical Failure Surface Searching Method, Using A Random Technique For Generating Circular Surfaces, Has Been Specified.

4000 Trial Surfaces Have Been Generated.

200 Surface(s) Initiate(s) From Each Of 20 Points Equally Spaced

Along The Ground Surface Between X = 140.00(ft)
and X = 225.00(ft)

Each Surface Terminates Between X = 300.00(ft)
and X = 700.00(ft)

Unless Further Limitations Were Imposed, The Minimum Elevation At Which A Surface Extends Is Y = 0.00(ft)

10.00(ft) Line Segments Define Each Trial Failure Surface.

Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Evaluated. They Are Ordered - Most Critical First.

* * Safety Factors Are Calculated By The Modified Bishop Method * *

Total Number of Trial Surfaces Attempted = 4000

Number of Trial Surfaces With Valid FS = 4000

Statistical Data On All Valid FS Values:
FS Max = 6.542 FS Min = 1.865 FS Ave = 3.264
Standard Deviation = 1.004 Coefficient of Variation = 30.76 %

Failure Surface Specified By 29 Coordinate Points

     Sum of the Resisting Forces (including Pier/Pile, Tieback,
Reinforcing
     Soil Nail, and Applied Forces if applicable) =  425609.75 (lbs)

     Average Available Shear Strength (including Tieback, Pier/Pile,
Reinforcing,
     Soil Nail, and Applied Forces if applicable) =   1524.49(psf)

     Sum of the Driving Forces =   358949.00 (lbs)

     Average Mobilized Shear Stress =    1285.72(psf)

     Total length of the failure surface =     279.18(ft)

          CAUTION - Factor Of Safety Is Calculated By The Modified
Bishop
                    Method. This Method Is Valid Only If The Failure
Surface
                    Approximates A Circular Arc.

                 *** SEISMIC SLOPE DISPLACEMENT DATA ***
          (Note: kv is set = zero for displacement calculations)
          Seismic Yield Coefficient (ky) =  0.2926(g)
          Calculated Newmark Seismic Displacement =   0.257(ft)

          Non-Symmetrical Sliding Resistance Has Been Specified
          for Downhill Sliding.

A Critical Failure Surface Searching Method, Using A Random
Technique For Generating Circular Surfaces, Has Been Specified.

4000 Trial Surfaces Have Been Generated.

200 Surface(s) Initiate(s) From Each Of 20 Points Equally
Spaced
Along The Ground Surface Between X = 140.00(ft)
and X = 200.00(ft)

Each Surface Terminates Between X = 250.00(ft)
and X = 700.00(ft)

Unless Further Limitations Were Imposed, The Minimum Elevation
At Which A Surface Extends Is Y = 0.00(ft)

10.00(ft) Line Segments Define Each Trial Failure Surface.

Following Are Displayed The Ten Most Critical Of The Trial
Failure Surfaces Evaluated. They Are
Ordered - Most Critical First.

* * Safety Factors Are Calculated By The Modified Bishop Method
* *

Total Number of Trial Surfaces Attempted = 4000

Number of Trial Surfaces With Valid FS = 4000

Statistical Data On All Valid FS Values:
FS Max = 10.096 FS Min = 1.867 FS Ave = 4.364
Standard Deviation = 1.979 Coefficient of Variation =
45.36 %

SLOPE STABILITY ANALYSIS SYSTEM

Modified Bishop, Simplified Janbu, or GLE Method of Slices.

(Includes Spencer & Morgenstern-Price Type Analysis)
Including Pier/Pile, Reinforcement, Soil Nail, Tieback,
Nonlinear Undrained Shear Strength, Curved Phi Envelope,
Anisotropic Soil, Fiber-Reinforced Soil, Boundary Loads, Water
Surfaces, Pseudo-Static & Newmark Earthquake, and Applied Forces.

ALTERNATIVE "B"

Perforated Pipe Surrounded with Rock & Filter Fabric

FILTER MATERIAL: Minimum volume of 9 cu. ft. per lineal ft. of ¾ in. maximum rock.

PIPE: ABS or PVC pipe or approved substitute with a minimum of 8 ¼ in. perforations per lineal ft. in bottom half of pipe.

ASTM D2751, SDR 35 or ASTM D1527, SCHD. 40	ASTM D3034, SDR 35 or ASTM D1785, SCHD. 40

NOTE: For continuous run less than 500 ft. use 6 in. dia. pipe
For contiuous run in excess of 500 ft. use 8 in. dia. pipe
For continuous run in excess of 1000 ft. use 10 in. dia. pipe

FILTER FABRIC: Mirafi 140 filter fabric or approved equivalent.

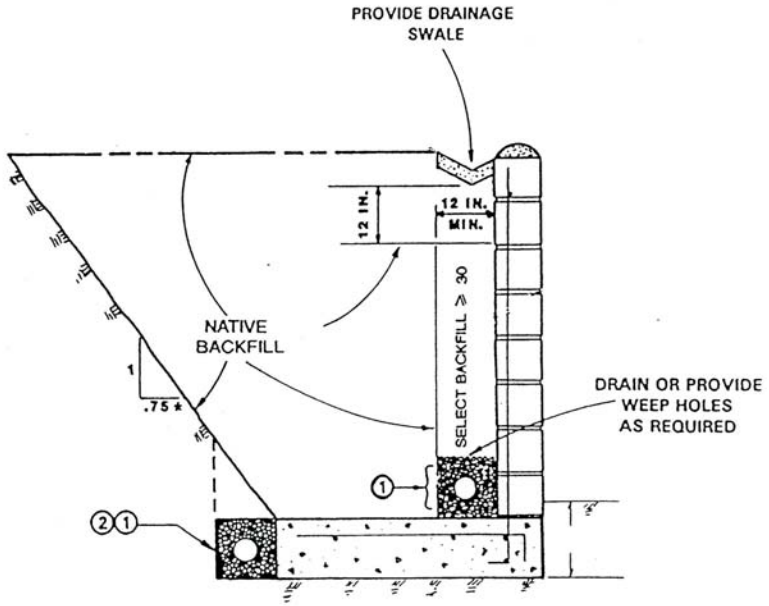
TYPICAL

RETAINING WALL BACKFILL



* OR AS REQUIRED FOR SAFETY

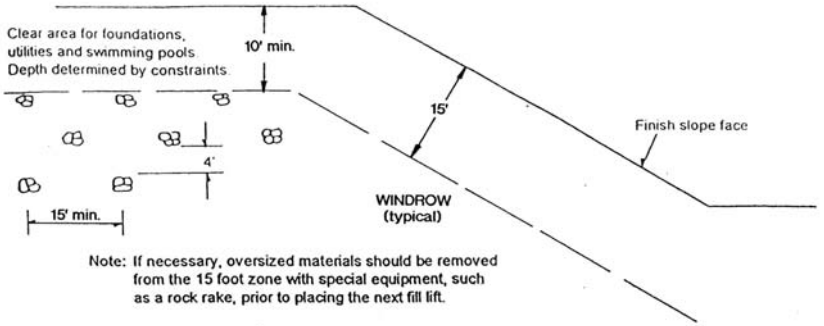
(1) 4-INCH PERFORATED PVC, SCHEDULE 40 OR APPROVED ALTERNATE. PLACE PERFORATION DOWN AND SURROUND WITH A MINIMUM OF 1 CUBIC FOOT PER LINEAL FOOT(1 FT^3/FT.) OF 3/4 INCH ROCK OR APPROVED ALTERNATE AND WRAPPED IN FILTER FABRIC.

(2) PLACE DRAIN AS SHOWN WHERE MOISTURE MIGRATION THROUGH THE WALL IS UNDESIRABLE.

NOT TO SCALE

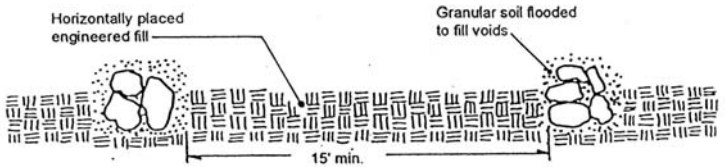
PROJECT NO. :
105-03
DATE :

ROCK DISPOSAL DETAIL



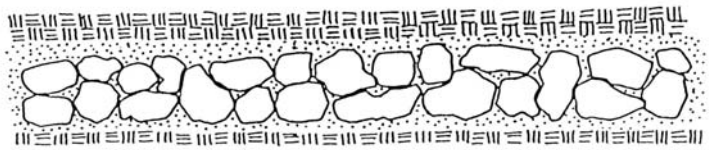
Note: If necessary, oversized materials should be removed from the 15 foot zone with special equipment, such as a rock rake, prior to placing the next fill lift.

TYPICAL WINDROW DETAIL (END VIEW)



Note: Engineered fill shall be brought up at a higher elevation along windrow so granular soil can be flooded in a "trench condition".

PROFILE VIEW



Note: In some situations, rock blankets may be utilized.

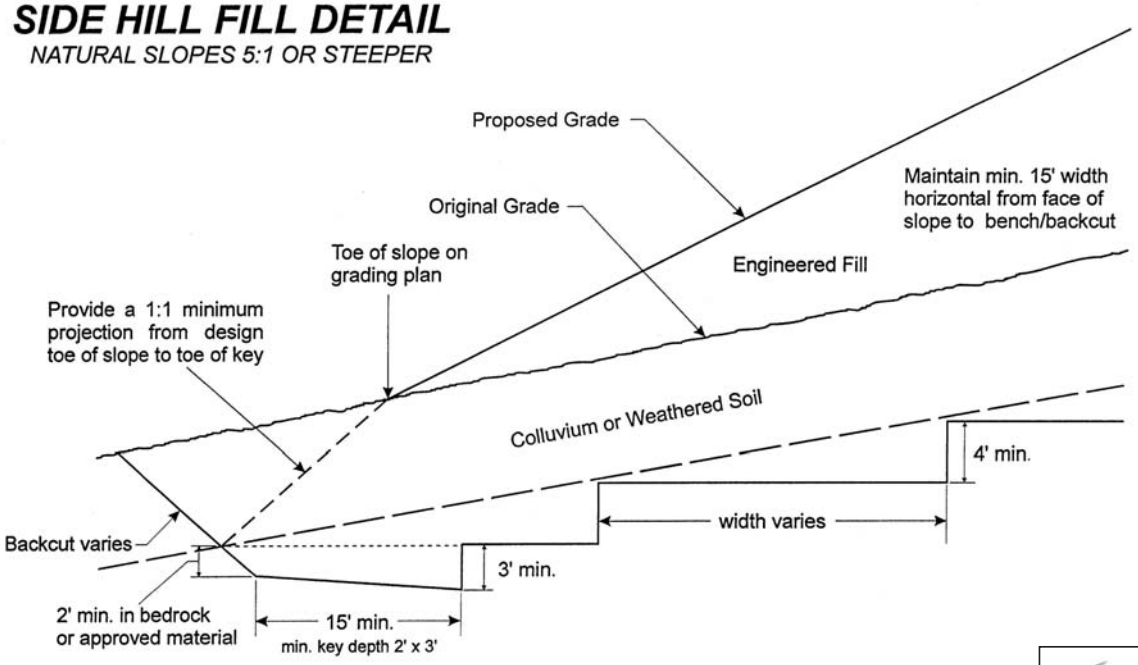
SIDE HILL FILL DETAIL

NATURAL SLOPES 5:1 OR STEEPER



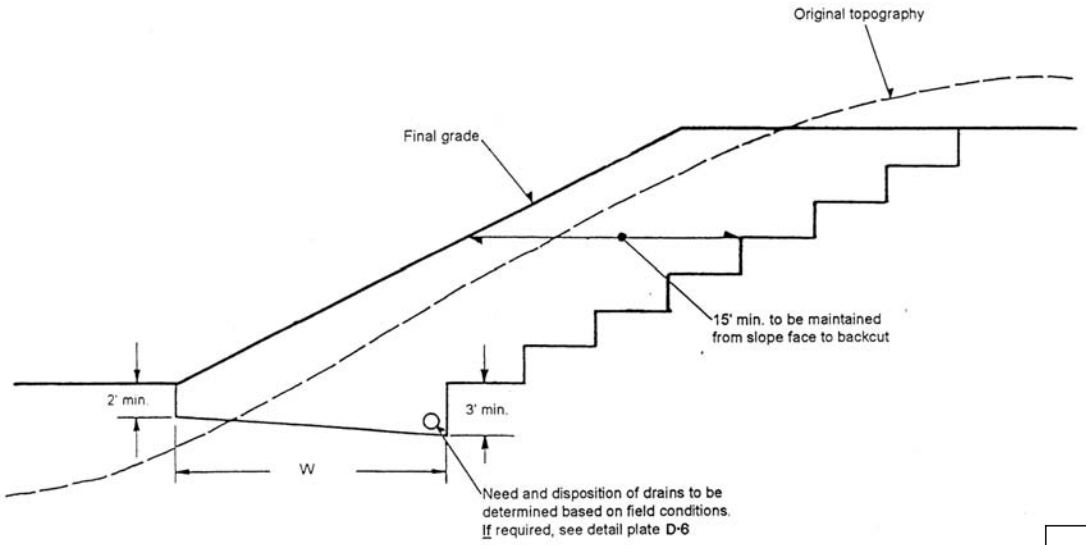
1) Where the natural slope approaches or exceeds the design slope ratio, special recommendations will be provided by the soil engineer.

2) The need for and disposition of drains will be determined by the soil engineer based upon exposed conditions.

PROJECT NO. : 105-03

DATE :

SKIN FILL ON NATURAL GROUND

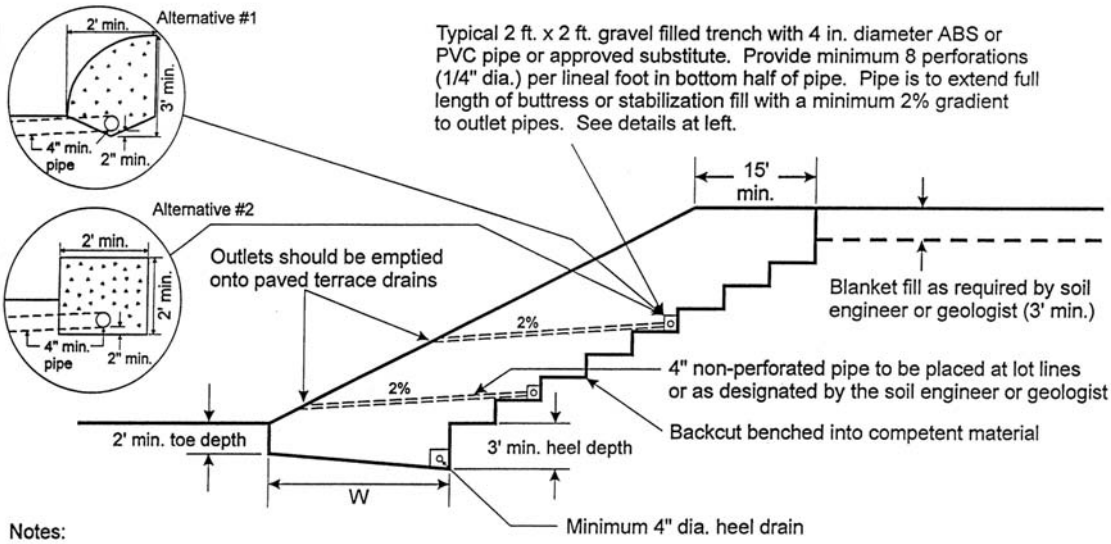


Note 1) The keyway "W" shall be no less than H/L and/or the width of equipment.
2) Bottom if keyway evaluation may need reconditioning.

PROJECT NO. : 105-03

DATE :

STABILIZATION / BUTTRESS FILL DETAIL



Notes:

1. ABS-ASTM D 2751, SDR 35 or ASTM D 1527 Sched. 40 PVC-ASTM D 3034, SDR 35 or ASTM D 1785 Sched. 40
2. Outlets to be provided every 100 ft. and joined to perforated backdrain pipe by L's or T's Min. 2% gradient.
3. Gravel trench to be filled with 3/8" gravel or equal mixture of No. 2 and No. 3 rock.
4. Backdrains and lateral drains located at elevation of each bench drain. The necessity for additional backdrains shall be determined in the field by the soil engineer of geologist.
5. Detail depicts two separate fill key conditions. In both cases, the keyway "W" shall be no less than H/2 and/or the width of equipment.

Attention: Mr. Brian Rupp

Dear Mr. Rupp:

Pursuant to your request, Neblett & Associates, Inc. have completed the fault investigation for your site in the Cherry Valley area in the County of Riverside. The results, conclusions and recommendations of this investigation are attached herein.

A cursory review of your conceptual plans indicate the plan will be feasible and the approximate building footprint can be positioned within the buildable area of the site.

We appreciate the opportunity to provide our services and are looking forward to reviewing the forthcoming grading plan.

Respectfully Submitted,
NEBLETT & ASSOCIATES, INC.

Project No.: 665-000-02

1.0 Introduction:

This report has been prepared to present our findings and conclusions of our (N&A) fault investigation performed in June and July of 2008 as well as to summarize and incorporate findings of the previous fault investigations and letter transmittals by the former geotechnical consultant – C.H.J. Incorporated (Aug. 3, 2005 through Sept. 15, 2006).

After our review of the former consultant's reports, our review of CDMG FER-235 (Treiman, 1994) and supplement No.1 (Treiman, 1995), our review of Riverside County's Fault Hazard Management Zone, our preliminary site reconnaissance, and our review of the site's structural geology, stratigraphy, and geomorphology, some issues arose that warranted resolution from a geotechnical standpoint. Paramount among these was the determination of precise fault location, particularly for the South Branch of the Cherry Valley Fault Zone (CVFZ).

1.1 Site Description:

The site has an irregular rectangular shape consisting of 395 acres and is located in the San Timoteo Badlands near the western portion of the San Gorgonio Pass and the southern flank of the San Bernardino Mountains (Figure 1). It is located just east of the Interstate 10 on the north side of Cherry Valley Boulevard. The site is accessible via unpaved, graded roads (Figure 2).

The northern half of the site is characterized by badlands topography with narrow ridgelines, steep flanks and narrow valleys trending northeast-southwest.

The southern half is relatively flat with subdued ridgelines in the north trending west-southwest merging into a flat alluvial plain trending east-west.

Vegetation consists predominately of native grasses with sage scrub and occasional scrub oak in the north. The southern portion of the site appears to have been cultivated for agriculture in the past.

A water line and fiber optic cable traverse the northern portion of the site in an east-west trend with several utility vaults. Some cuts, fills and roadways are associated with this easement.

1.2 Purpose and Scope of Investigation:

Paramount among our objectives was the refinement of the location of the South branch of the Cherry Valley Fault Zone – especially in the eastern portion of the site where potential structural setback zones from faulting could affect proposed development. The significant extrapolation distances between fault outcrops in CHJ's roadcuts and fault trenches and their highly variable measurements of the fault's strike and dip warranted additional subsurface fault trenches.

In brief, the scope of this fault investigation included the following:

- A thorough review of available documents and maps from federal, state and local authorities.
- Perform an aerial photo lineament analysis.
- Perform a site reconnaissance.
- Develop Structure Contour based on CHJ's measured outcrops on the South Branch of the CVFZ.
- Excavate and log six fault trenches.
- Log roadcut along east property line.
- Provide a report of findings, conclusions and recommendations.

1.3 Summary of Previous Investigations:

Various geologists have indicated essentially two parallel strands of the Cherry Valley Fault Zone that traverse the site from the northwest to the southeast. Treiman has summarized their work in the CDMG, FER-235, Plate Ia (1994) and their fault strand locations are primarily based on aerial photo interpretation (see Plate Ia. Attached as Figure 3). Treiman (1994) depicts these faults mapped by Shuler (1953) as two sub-parallel normal faults which merge to

PROJECT 665-000-01 DATE 9-22-08

form one trace and Shuler shows the fault zone juxtaposing terrace deposits (on the south side) against San Timoteo Formation. Bloyd's trace (1971) showed only one concealed trace approximately coincident with Shuler's northern trace. Bloyd indicated the Cherry Valley Fault is a "postulated fault" based on groundwater data. Matti and Morton (1974-1991) show two traces similar to Shuler's and consider the Cherry Valley Fault Zone in the vicinity of the subject site as the western extension of the San Gorgonio Pass Fault Zone. The Preliminary Fault Activity map of California (Jennings, 1992) indicates the Cherry Valley Fault Zone to have late Quaternary displacement (past 700,000 years).

The County of Riverside (1990) has established a Fault Hazard Management Zone for the Cherry Valley Fault Zone within and in the vicinity of the site for planning purposes. They depict three strands of the Cherry Valley Fault Zone in the northeast portion of the site (Figure 4). Two of these appear coincident with Shuler (1953) and Matti et al. (1992). The third northwesterly-trending strand may be coincident with the fault mapped by ICG (1990).

CHJ Inc. performed a site specific subsurface investigation of faulting with a report dated Aug. 3, 2005. They utilized aerial photo lineament analyses, geologic field mapping, excavation of 5 trenches totaling 2,215 lineal feet from 15 to 21 feet deep, and 4 slope cuts totaling 2,600 lineal feet. The results of this investigation identified two fault splays associated with the Cherry Valley Fault Zone trending northwest to southeast across the site. They determined the southern branch of the two faults to be inactive. The age of activity of the north branch could not be determined.

As a result, for the North Branch Fault and the northeastern portion of the site beyond the areas covered by their explorations, they recommended a Restricted Use Zone to mitigate the potential for surface rupture (CHJ, 2005).

Immediately east of the subject site, Leighton Consulting, Inc., 2004) and Leighton and Associates, Inc. (2006) conducted geotechnical investigations and fault investigations for the Danny Thomas Portion of the Sunny-Cal Egg Ranch Project (~122 acres). Their fault investigations included their designated Fault B (CHJ's and this firm's North branch extension) and Fault A (CHJ's and N&A's South Branch extension).

In July of 2004, Earth Consultants International (ECI) provided Leighton and Associates, Inc. with a report titled "Report, Age Estimates of the Near-Surface Deposits in Support of a Fault

CVAR_09821

Trenching Study Conducted by Leighton and Associates". This report was included in Leighton Consulting, Inc. fault investigation report dated Aug. 3, 2004. They utilized investigative techniques including aerial photo lineament analyses, the excavation and logging of 8 fault trenches to intersect the South Branch of the Cherry Valley Fault Zone, soil stratigraphic age analyses (ECI) and radio carbon age-dating.

Based on the report and soil stratigraphic analyses by ECI, the South Branch of the Cherry Valley Fault Zone on the Danny Thomas portion of the Sunny-Cal Egg Ranch is inactive (their designated Fault A).

In August of 2006, Leighton and Associates, Inc. provided a supplemental fault investigation report concerning the location and activity of the North Branch of the Cherry Valley Fault Zone (their designated Fault B) within the Danny Thomas portion of the Sunny-Cal Egg Ranch. They utilized logging of a road cut (335 lineal feet) and 7 fault trenches totaling 660 lineal feet from 4 to 15 feet deep. They conclude the North Branch of the Cherry Valley Fault Zone (their designated Fault B) as inactive.

According to Leighton & Associates (2006), their review of a faulting investigation by James R. Evans (2005) located approximately ½ mile east of their Danny Thomas site indicated he probably intercepted the South Branch of the Cherry Valley Fault Zone where he established a 100 ft. wide structural setback zone for that fault.

In September of 2006, C.H.J. Inc. issued an update to their subsurface investigation of faulting report (2005) for the subject site. Based on the evidence from Leighton's investigation (2006), they "conclude that the fault (Fault B) mapped by this firm are the same geologic feature. Additionally, based on the soil age estimates of the alluvial soils reported by Leighton of un-ruptured soils across the fault trace, we conclude that the Cherry Valley Fault-North Branch mapped at the subject site is considered inactive as defined by the State of California and are recommending that the RRUZ associated with the Cherry Valley Fault-North Branch be removed."

This firm's review comments regarding these investigative reports is provided in Section 6.0 of this report.

2.0 Geomorphic Setting:

The subject site is located at the western end of a relatively broad east-west trending trough known as the San Gorgonio Pass between the San Jacinto Mountains on the south and the San Bernardino Mountains to the North (Figure 5). This pronounced morphologic feature is predominately due to the tectonics of the area consisting of complex faulting, folding and uplift. The erosional and depositional processes have played a minor role in the geomorphology of the area when compared to the tectonic processes.

The San Gorgonio Pass is the lowest topographic break in southern California through the mountains to the inland deserts, separating Mt. San Gorgonio (elevation 11,502 ft.) and Mt. San Jacinto (elevation 10,786 ft.), the two highest mountains in southern California. The crest of the pass is the headwaters of three major drainage basins: the interior-draining Whitewater River-Salton Trough to the east; the generally interior-draining San Jacinto basin to the south; and the Santa Ana basin to the west.

The flanks and the floor of the trough contain dissected old alluvial fan deposits, old alluvial gravel and sand sediments, and recent alluvial gravel and sand of stream channels that have formed relatively flat prediments sloping gently to the trough's axis.

The subject site is located at the western end of this trough on the north flank. The site and its vicinity are within the San Timoteo Badlands characterized by northeast to southwest trending narrow ridges and valleys that provides the source for the older alluvial fan deposits and younger alluvial sands and gravels to the south.

Within the subject site, the typical northeast-southwest trending ridges and valley drainages changes direction at the Cherry Valley Fault Zone (north and south branch) to east-northeast to west-southwest trending ridges and valley drainages. (Figure 6). The modern drainage of the recent alluvial plain in the south again changes direction from east-northeast to west-southwest immediately south of the Cherry Valley Fault Zone to east-west in the southern portion of the site.

These changes in drainage flow direction suggest that they are predominately controlled by fault movements and uplift.

3.0 Geologic Setting:

3.1 Regional Geologic Setting

The site is located near the boundary of the northeastern Peninsular Ranges and the southeastern Transverse Ranges consisting of the San Jacinto Mountains and the San Bernardino Mountains respectively. The northeastern Peninsular Ranges are part of the Southern California Batholith which is comprised of Paleozoic to Mesozoic age igneous, metasedimentary and metavolcanic rock types overlain unconformably by non marine clastic sediments of late tertiary and Quaternary age.

The northwesterly trend of elongate ranges and valleys of this portion of the province are terminated abruptly by the general east-west grain of the Transverse Ranges.

The southeastern portion of the Transverse Range contain the San Bernardino Mountains which have been uplifted along the San Andreas and Banning Faults on the south and along several steeply dipping reverse faults on the north.

The subject site is situated at the juncture of the Transverse Range and the Peninsular Range in the western end of the San Gorgonio Pass Area. (Figure 7). In this area, the Mojave Desert segment and the Coachella Valley segment of the San Andreas Fault Zone step left from each other and this fault zone becomes a complex combination of strike-slip faults and thrust and tear faults that include the Banning Fault and the San Gorgonio Valley Fault Zone. The Cherry Valley Fault Zone of the subject area is considered a western extension of the San Gorgonio Pass Fault Zone (Matti and Morton (1993).

The site is also located in the "Badlands" area of relatively low hills southeast of Calimesa characterized by narrow ridge lines and steep-walled flanks comprised predominately of the San Timoteo Formation within the Peninsular Ranges province (Figure 8). This Plio-Pleistocene age sedimentary unit consists of fluviatile sandstones, and gravels with minor lacustrine siltstones. The floor and edges of the San Gorgonio Pass trough consist of dissected old alluvial terrace deposits and younger alluvial sands and gravels. These units are present in the southern portion of the subject site.

LEGEND

SURFICIAL SEDIMENTS
Unindurated, undissected

Qg *Alluvial gravel and sand of stream channels*
Qa *Alluvial sand, gravel and clay of level areas, covered by residual soil*

— UNCONFORMITY —

OLDER SURFICIAL SEDIMENTS
Weakly indurated alluvial fan deposits derived from local terrains

Qoa *Alluvial gravel and sand, light reddish brown and of granitic and gneissic detritus of San Bernardino Mountains in north areas, brownish gray in south area; top surface slopes slightly from source terrains*

— UNCONFORMITY —

SAN TIMOTEO FORMATION
(San Timoteo Beds of Frick, 1921) Stream laid alluvial sediments of detritus derived from plutonic and metamorphic rocks of San Bernadino Mountains NE of Banning Fault and deposited on plutonic and meta-sedimentary rocks of Peninsular Ranges NE of San Jacinto Fault zone; weakly indurated; upper part yielded vertebrate fauna diagnostic of Blancan Stage, Plio-Pleistocene (Frick, 1921, Savage et. al. 1954) or Irvingtonian Stage, earliest Pleistocene, (Repenninga 1987) lower or main part inferred to be of Pliocene age (Morton and Matti, 2001)

QTst *Upper part, sandstone, light gray to tan, fine to coarse grained arkosic and minor conglomerate of mostly granitic detritus, some gneissic and quartzitic detritus; includes thin layers of soft greenish to light reddish silty claystone, overlain by older alluvium*
QTsg *Conglomerate/conglomerate, brownish gray, crudely bedded, of poorly sorted subrounded clasts of granitic and gneissic detritus in sandy matrix, base unexposed, overlain by older alluvium; probably proximal facies of upper part (QTst); exposed adjacent to Banning fault*
Tst *Main part (middle part of Morton and Matti, 2001) sandstone, minor conglomerate and claystone, similar to those of upper part; conformably overlain by upper part (QTst), conformably underlain by Mount Eden Formation (Tme), but thins and buttresses eastward onto basement rocks as shown.*

MOUNT EDEN FORMATION
(of Frazier, 1931), present only near and SE of Mount Eden, stream laid sediments, clasts derived from basement rocks of Peninsular Ranges, moderately lithified, conformable below San Timoteo Formation, overlies basement rocks; mostly sandstone, lithified divided into 4 members by Morton and Matti 2001; one member contains vertebrate fauna diagnostic of late Hemphillian Stage, middle Miocene, dated about 5.3 MA (Morton and Matti 2001)

Tme *Sandstone, medium grained, arkosic, includes interbeds of micaceous silty shale, strata light gray to light reddish maroon, locally contains concretions*
Tmg *Granitic conglomerate, composed of subrounded to subangular boulders and cobbles of light gray massive biotite-hornblende quartz diorite (tonalite), unsorted; form lenses within and at top of unit Tme, derived from quartz diorite to NE (Morton and Mattei, 2001)*

— UNCONFORMITY —

PLUTONIC ROCKS
medium grained holocrystalline granitic rocks; age, Cretaceous

gr *Granitic rock of Mount Eden, granite to monzo-granite (Morton and Matti, 2001) composed of quartz, potassic feldspar and sodic plagioclase feldspar in nearly equal amounts but with somewhat more potassic feldspar, scattered flakes of white mica and almost no mafic minerals, nearly white, massive; intrusive into meta-sedimentary rocks; exposed only near and SE of Mount Eden*
qdi *Granodiorite of east area; composed of quartz, potassic feldspar and sodic plagioclase feldspar in nearly equal amounts but with somewhat more sodic plagioclase feldspar, minor biotite, light gray, massive to very faintly gneissoid*
qdx *Quartz diorite (Bonzal Tonalite of Larsen, 1948) composed of about 1/3 quartz, 2/3 sodic plagioclase feldspar, minor potassic feldspar and 5-10% biotite and hornblende, light gray gneissoid, with abundant dark gray discoid inclusions (xenoliths) parallel to gneissoid foliation; exposed only at SW corner of quadrangle*
grq *Granitic rock exposed NE of Banning fault at NE corner, of quartz monzonite composition, of quartz, potassic feldspar and sodic plagioclasefeldspar in nearly equal amounts and about 5-10% biotite as evenly scattered flakes, light gray, massive, somewhat incoherent*

HORNBLENDE DIORITE GABBRO

hdg *Mafic rock exposed at NE corner of quadrangle NE of Banning fault; gray-black, medium grained, massive, composed of about 75% hornblende, 0-30% plagioclase feldspar, locally contains green epidote as secondary veinlets; age Mesozoic (Cretaceous)*

METASEDIMENTARY ROCKS
Remnants of metasedimentary petrolith of San Jacinto Mountains, exposed only near and SE of Mount Eden in this quadrangle; age inferred to be Paleozoic (Morton and Matti; 2001)

ms *Mica schist-phyllite, composed of biotite mica, feldspar and quartz, ranges to fine grained gneiss, locally includes calcsilicate skarn, dark gray, foliated along relict bedding planes*
ml *Marble, of calcite and dolomite, pale gray to white, medium to coarse grained, indistinctly bedded, locally contains skarn of diopside, wollastonite, tosterite, garnet and graphite (Morton and Matti 2001) occurs as layers and lenses in unit ms*
mig *Mixture of metasedimentary rocks (schist-gneiss-ms) with quartz diorite (qdx); complexly migmatized, at southwest corner*

GNEISS

gn *Gray quartz-feldspar-biotite gneiss, thin bedded, hard but brittle; age, Precambrian (?), occurs as small pendant remnants engulfed in unit grq NE of Banning fault*

3.2 Regional Tectonic Setting:

The tectonic setting of southern California is dominated by the northwest-trending San Andreas Fault and its sister faults which have a right-lateral movement pattern between the North American Plate and the Pacific Plate. Local compression and/or extension as a result of the translational motion along this plate boundary has formed left-lateral, reverse, normal and blind thrust faults.

3.2.1 San Andreas Fault:

The main strand of the San Andreas Fault in southern California has been divided into two segments – the Mojave Desert segment separating the San Bernardino Mountains from the San Gabriel Mountains, and the Coachella Valley segment separating the Peninsular Ranges from the San Bernardino Mountains (Matti and Morton, 1993). The main strand deflects west in the San Gorgonio Pass area where the fault zone becomes more complex and does not have a clean, currently active, throughgoing fault break but is a combination of older strike-slip faults and newer thrust and tear faults (Treiman, 1994). The Banning and San Gorgonio Pass faults – including the Cherry Valley Fault Zone, are part of this complex fault system in the San Gorgonio Pass area.

The Coachella Valley segment splits into two principal strands as it approaches the San Bernardino Mountains. The most northern has been designated as the North Branch of the San Andreas Fault by Diblee (1975), the Mission Creek Fault by Allen (1957), and the Coachella Valley Segment of the San Andreas Fault by Matti et al. (1992). This strand merges to the northwest into the Mill Creek and Mission Creek faults (Figure 7). The southern strand of the Coachella Valley segment is designated as the South Branch of the San Andreas Fault by Dibblee (1975), the Banning Fault by Allen (1957), and the Coachella Valley segment of the Banning Fault by Matti et al. (1992). Upon its approach into the San Gorgonio Pass it veers westward (Figure 7).

3.2.2 San Gorgonio Pass Fault Zone:

This zone is characterized by discontinuous reverse and thrust faults and associated tear faults (Treiman, 1994) generally located at the base of the San Bernardino Mountains (Figure 7). The San Gorgonio Pass Fault Zone includes, from the west to east, the Cherry Valley Fault Zone, a fault along the toe of the Banning Bench, and a northeast-trending segment crossing the lower part of the Millard Canyon Fan.

The Cherry Valley Fault Zone in the subject site's vicinity has been mapped by Matti and Morton (1974-91) as two traces. This fault zone has been mapped by various workers (Figure 3) predominately as two sub-parallel faults which merge to the east to form one trace near the eastern property boundary (Figure 7) and then veers northeast, displacing remnants of a mid – to late – Pleistocene fan (Treiman, 1994).

East of the subject site, the Cherry Valley fault becomes the San Gorgonio Pass Fault Zone and is characterized as a sinuous trace forming several discontinuous scarps on the older fan mid-Pleistocene fan surfaces (Matti and Morton, 1993), Farther east, the fault steps southward from the range from forming the Highland Springs scarp and the toe of the Banning Bench. Matti et al. (1993) infer northwest-trending, right-lateral tear faults in this area. (Figure 7). This fault zone continues northeast as a thrust fault where it eventually merges with the Banning Fault near Gorgonio Canyon.

3.2.3 Banning Fault:

The Banning Fault is considered an ancestral trace of the San Andreas Fault (Allen, 1957; Matti et al., 1992) which has been inferred from the Indio Hills to the San Jacinto Fault (Figure 7). During late Cenozoic time the Banning Fault was principally a right-lateral fault, but it has since responded mainly to compressional tectonics in Gorgonio Pass and continuing as a strike-slip fault only to the east (Matti and Morton 1993).

This fault is located approximately ¼ mile north of the subject site where it consists of a prominent high-angle trace which separates Pleistocene San Timoteo Formation on the south from granitic rock to the north (Figure 8). Displacement in this area is indicated as a strike-slip by Matti et al. (1992).

East of Cabazon, the Banning Fault represents a branch of the Coachella Valley segment of the San Andreas Fault and is considered active.

3.2.4 Mill Creek Fault:

This branch of the San Andreas Fault (the "North Branch" of Diblee, 1964) is a major structural boundary of basement rock types separating predominately granitic rocks along the northeast side from predominately gneissic rocks on the southwest side. The Mill Creek Fault is located approximately 10 miles north of the subject (Figure 7). Matti et al. (1993) believe that this strand is no longer an active part of the San Andreas Fault Zone, although it may have been locally reactivated by dip-slip movement.

3.2.5 Beaumont Plain Fault Zone:

Matti et al. (1993) identified four north-northwest trending normal faults which terminate near the southeast corner of the subject site (Figure 7). They are considered an extensional zone of faults irregularly expressed as scarps in mid-Pleistocene and older surfaces and are considered inactive (Treiman, 1994).

3.2.6 San Jacinto Fault:

The San Jacinto Fault is located approximately 6 miles southwest of the site (Figure 7) and consists of a system of northwest-trending, right-lateral, strike-slip faults. This fault traverses rocks of Peninsular Ranges type and the alluviated San Bernardino Valley before entering the southeastern San Gabriel Mountains (Figure 7). There the fault splays into several sub-parallel strands that traverse rocks of Peninsular Ranges type and San Gabriel Mountains type (Matti and Morton, 1993).

The San Jacinto Fault is the closest known active fault to the site and is considered the most influential with respect to ground shaking and rupture. More large historic earthquakes have occurred on the San Jacinto Fault than any other fault in Southern California (Working Group on California Earthquake Probabilities, 1988).

3.2.7 Historical Seismicity:

A large earthquake ruptured the northern reaches of the San Bernardino segment of the San Andreas Fault on Dec. 8, 1812 which has been inferred by Jacoby et al. (1987) using dendrochronological evidence, and by fault trenching by Fumal et al. (1993) at Wrightwood. This event may have ruptured into the San Bernardino Valley (Fumal, 1993).

Another major event known as the great 1857 Fort Tejon earthquake ruptured the Mojave segment of the San Andreas Fault. In 1948, a magnitude 6.5 earthquake ruptured the Coachella Valley segment of the San Andreas Fault in the Desert Hot Springs area.

An earthquake of magnitude 5.9 occurred on July 8, 1986, 10 km. northwest of North Palm Springs. Kahle and others (1987) indicated the epicenter near the Mission Creek fault with most of the associated surface faulting occurring along the Banning Fault with minor ruptures along Mission Creek and Garnet Hill Faults.

The Working Group of California Earthquake Probabilities (1988) indicate 7 magnitude 6.0 or greater earthquakes occurring on the San Jacinto Fault since 1899. Two of theses include the magnitude 6.5 earthquake near Lytle Creek in 1899 and 6.2 magnitude event in Loma Linda in 1923.

Figure 7 (from Matti et al. 1992) presents the modern tectonic regime illustrating relations between faults and crustal blocks in the vicinity of the south-central Transverse Ranges.

3.3 Site Geology:

The main geologic units within the site include the Plio-Pleistocene San Timoteo formation in the northeast, and in the southwest old alluvium of an old dissected alluvial fan, with young alluvium along the valley floors. Structurally, the site is dominated by two splays of the Cherry Valley Fault – the North Branch and the South Branch which transect the site in a northwest to southeast trend (Figure 11). The South Branch generally places the San Timoteo Formation in fault contact with the older alluvium, except in the southeast where it juxtaposes older alluvial units against one another.

In some of our fault trenches, the old alluvium can be separated into a younger and older unit. These have not been differentiated on the geologic map (Figure 11).

Colluvium is the loose heterogeneous, and incoherent mass of soil material and rock fragments deposited by sheetwash, or slow continuous downslope creep collecting at the base of gentle slopes and hillslides. Colluvium mantles the slope of the site but is generally less than 2ft. in thickness and therefore has not been delineated on Figure 11.

Undocumented artificial fill is present as backfill for the fault trenches of former investigations as well as this investigation. Artificial fill is also present with and in the vicinity of the San Gorgonio Pass Water Agency Pipeline easement that transgresses the northern portion of the site. Some of our fault trenches indicate that past agricultural activities and trenching have spilled fill along the edges of the flat-topped ridges in the southern half of the site.

The geologic units mapped at the site are discussed below in order from youngest to oldest.

3.3.1 Undocumented Fill (afu):

This unit has been delineated as shown on Figure 11. Where observed, this unit consists of a heterogeneous mixture of pebbly sand, silty sand, sandy silt, and coarse sand with cobbles and an occasional boulder. In addition to the minor undocumented fills within the fault trenches, spill fills associated with the former investigator's slope cuts are evident downslope. Historic aerial photo analyses and trenching have revealed that an east-west trending ridge located near the eastern property boundary has been cut and "flat-topped" for agricultural purposes. This grading occurred near CHJ Trench "T-4" and extends westerly to the ridge terminus, west of Neblett Trench NT-2. In addition, a significant undocumented canyon fill was placed south-southeast of NT-5. This fill was likely placed concurrently with aforementioned ridge-top cut and used the spoils generated from same.

3.3.2 Younger Alluvium (Qya):

Younger alluvial units outcrop in the active drainages which generally trend southerly to southwesterly onsite. The materials were only exposed in one of the Fault study trenches (NT-4, at its westerly end)). In NT-4, these younger alluvial materials consisted of silty sands and

lesser gravelly sands. Local outcrops within active drainages reveal a highly variable lithology for this unit, which is consistent with the deposition of finer materials during relatively quiescent periods and very coarse materials during periodic storm events.

3.3.3 Older Alluvium (Qoa):

Older alluvial units onsite consist of reddish brown clayey sands and yellowish brown silty sands. Both units have frequent gravel and gravelly sand lenses. The reddish brown clayey sands are highly oxidized and re-mineralized, suggesting a significant difference in age. In the fault trenches, where these units could be differentiated, they have been denoted as Qoa_1 and Qoa_2. These units are usually massive to poorly bedded with localized well-bedded gravels. Where bedded, the units displayed horizontal or near horizontal bedding except where proximal to faulting, where dips of up to 45 degrees were observed.

3.3.4 San Timoteo Formation (Qtst):

The San Timoteo Formation is located primarily northeast of the South Branch of the Cherry Valley Fault (Figure 9) and consists predominately of cobble-boulder conglomerate with minor interbedded fine to medium sandstones. The conglomerate matrix is generally moderately to well-cemented and the interbedded sandstones are relatively thin compared to the thick massive conglomerates. Clasts are moderately weathered to decomposed and consist of granodiorite, greenstone, quartzite and monzogranite from the adjacent Transverse Ranges. The unit is generally matrix supported with localized clast supported lenses, and is massive to poorly bedded.

Structurally, beds dip at shallow angles to the southwest except near the North Branch of the Cherry Valley Fault and other faults in the northeast portion of the site where beds dip nearly vertical.

These fluviatile sediments were deposited during the Pliocene and Pleistocene time when the depositional basin was subsiding, uplift of the San Bernardino and San Jacinto Mountains was occurring, and movements within the San Andreas and San Jacinto fault systems was taking place (Morton & Matti, 1993).

3.4 Site Faults:

Two main faults, the north and south branches of the Cherry Valley Fault Zone (CVFZ) have been mapped onsite. Though these two main breaks help define the zone, lineaments and geomorphic evidence suggest a zone of faulting and deformation associated with the CVFZ that may be as wide as 500-700 feet.

North Branch CVFZ

The North Branch has been exposed onsite in one trench by CHJ (T-1B) and two CHJ road cuts (SC-2 and SC-4). The north branch is characterized by steeply dipping (near vertical) faulting that is located roughly 200-300 feet north-northeast of, and roughly parallel to, the South Branch. The fault generally juxtaposes massive conglomeratic sandstone units within the San Timoteo Formation making relative offset difficult to determine. This fault was not trenched for this report due to its location, over 200 feet north of the conceptual development footprint.

South Branch CVFZ

This fault has been exposed in CHJ trenches (T-1B, T-2, T-3, T-4) and road cuts (SC-1, SC-2 and SC-3) and in Neblett Trenches (NT-2, NT-3A, NT-5, NT-6) and in road cut RC-1. It is characterized by a northwest to east-west trending, north dipping reverse fault. Dips are low to moderate angle (10-45 degrees). Drag folding along the main rupture observed and logged by both CHJ and N&A indicate reverse/thrust kinematics. Relative offsets were not measurable in exposures and trenches but are significant, as the fault juxtaposes older San Timoteo (Plio-Pleistocene) over relatively younger alluvial units. Significant changes in stratigraphy, topography, geomorphology, and streamflow direction, are present along the entire mapped trace of this fault. This fault was the central focus of this report, due to its potential effect on the conceptual development footprint.

4.0 Investigative Techniques:

4.1 Aerial Photo Lineament Analysis:

A total of 5 stereo-pair Aerial Photographs from the Fairchild Collection at Whittier College were analyzed using a Sokkia MS27 stereoscope. In addition, various online satellite images from Google Earth were also utilized.

LIST OF REVIEWED STEREOSCOPIC AERIAL PHOTOGRAPHS

FLIGHT NUMBER	FRAME NUMBER	DATE
C-6060	150	12/7/39
C-12095	1:106 through 1:107	8/24/48
C-16123	1:29 through 1:30	2/15/51
C-23023	9:09 through 9:11	2/26/58

The lineaments were categorized into three types – strong, moderately strong, and weak lineaments. The following provides the basis for characterizing each type:

Strong Lineaments:

This type is characterized by a strong alignment of offset or deformed ridgelines, beheaded streams, faceted spurs on ridgelines, well defined alignment of topographic breaks, and a pronounced alignment of change in topography.

Moderately Strong Lineaments:

This type of lineament is a less pronounced alignment of topographic breaks and ridgeline offsets which often coincide with some faceted spurs and slight drainage deflections.

Weak Lineaments:

Weak lineaments are recognized as alignments of subtle changes in topography and ridgeline offsets. Slight tonal changes are sometimes recognizable from changes in bedrock lithology and/or vegetation.

Aerial Photo Analysis: Our aerial photo analysis revealed many moderate to strong lineaments that were not observed or denoted by previous workers. In addition, unusual geomorphology/topography in the form of bent drainages, beheaded box canyons and uplifted terrace surfaces were also noted by geologists from this firm.

4.2 Field Reconnaissance Mapping:

During the fault trenching, the slope cuts by CHJ and other exposures were observed and mapped in the vicinity of the South Branch of the Cherry Valley Fault. A road cut near the eastern property line denoted as RC-1 was cleaned and logged in detail.

4.3 Fault Trenching:

A total of six fault trenches were excavated during this investigation utilizing a Hitachi ZX450H Excavator (Plate 1). The trenches varied in length from 120 ft. to 970 ft.± and averaged 12 to 15 ft.± in depth. Both walls of the trenches were "stepped" with a 5 ft.± horizontal bench for safety purposes and to facilitate logging. All trenches were logged by geologists from this firm at a scale of 1 inch = 5 feet. In addition to the six trenches an existing road cut located near the eastern property line (RC-1) was also re-exposed/cleaned with a ZX450H Excavator and detail-logged by geologists from this firm.

The trenches were strategically located between the CHJ trenches to decrease the extrapolation distance between fault exposures, and to determine if the moderately strong lineament trenching southeast in the east-central portion of the property was fault related. This lineament also coincided with the structure contour of the South Branch of the Cherry Valley Fault.

5.0 Results of Investigation:

5.1 Aerial Photo Lineament Analysis:

Google Earth Images facilitated the delineation of the various lineaments within and near the subject site. Figure 9 depicts the strong, moderately strong, and weak lineaments within and adjacent to the site boundaries.

The Strong lineament mimics the North Branch of the Cherry Valley Fault of CHJ and this firm as shown on Figure 9 and Figure 10. Distinct topographic breaks across ridgelines are aligned in the northwest portion of the site and a linear trough with deflected ridgelines and drainages are aligned in the central and east-central portion of the site.

Southwest of the strong lineaments is a moderately strong lineament which mimics the location of the South Branch of the Cherry Valley Fault across ridgelines in the northwest and towards the southeast where the lineament veers southeast of the known location of the South Branch of the Cherry Valley Fault in the eastern portion of the site.

Two parallel moderately strong lineaments are recognized in the northeast portion of the site north of the North Branch of the Cherry Valley Fault. Topographic changes and deflections of ridgeline are aligned, which suggest possible faulting.

Two weak lineaments are recognized northeast of the site which may or may not be fault related.

5.2 Fault Trench NT-1:

FT-1 was excavated along a spur ridge just southeast of the south branch of the CVFZ located in CHJ Road Cut 3. This trench crossed both the structure contour developed using the strike and dip from CHJ's south branch measurements at Road Cuts1-3, and the topographic/geomorphic anomalies recognized by this firm. NT-1 exposed unfaulted Older Alluvium (Qoa) for its entire length. These older alluvial materials consisted of fine-grained silty sands with lesser gravelly sands and clayey sands, generally in the 7.5YR to 10YR range hues. The units observed ranged from massive to poorly stratified. Main lithologic units were observed to be unbroken along the entire length of the trench (Figure 13, in map pocket).

5.3 Fault Trench NT-2:

NT-2 was excavated near CHJ trench FT-2, and exposed the south branch of the CVFZ near station 0+45 (Plate 2). San Timoteo formation is in erosional contact with older alluvium on the north side of the fault, which is in reverse fault contact with underlying similar older alluvium on the south side. The measured strike and dip of the main fault surface of the south branch at NT-2 is roughly east-west and dipping 28 to 29 degrees north. The proximity of the San Timoteo formation, the low-angle faulting, the characteristic reddish brown clayey sand gouge (observed in CHJ roadcuts SC1-SC3), and the reverse kinematics (reverse drag-folding, particularly distinct along upper plate lithologic units) strongly supports that the fault exposed is the south branch of the CVFZ. (Figure 14, in map pocket). Analyses of historic aerial photographs confirm that the lack of soil development and unusually flat terrain in the vicinity of NT-2 is due to prior grading or agricultural use.

5.4 Fault Trenches NT-3 and NT-3A:

Trenches NT-3 and NT-3A crossed both the structure contour developed using the strike and dip from CHJ's south branch measurements at Road Cuts SC-1 SC-2 and SC-3, and the topographic/geomorphic anomalies recognized by this firm.. It was extended to the north as Trench NT-3A in order to expose the south branch of the CVFZ. Trenches NT-3and NT-3A exposed Older Alluvial (Qoa) materials consisting of silty sands, coarse gravel and gravelly sands. The South Branch of the CVFZ was exposed near STA 0+75 in Trench FT-3A. The South Branch at FT-3A differed from other trenches in that the faulted materials were relatively unbedded/massive and therefore did not display the drag folding observed in other excavations. (Figure 15, in map pocket).

Analyses of historic aerial photographs confirm that the lack of soil development and unusually flat terrain in the vicinity of NT-3A is due to prior grading or agricultural use.

5.5 Fault Trench NT-4:

This trench crossed both the structure contour developed using the strike and dip from CHJ's south branch measurements at Road Cuts SC1 through SC3, and the topographic/geomorphic anomalies recognized by this firm. NT-4 exposed unbroken older alluvium for its entire

length. These materials consisted of silty sands, and lesser coarse gravel and gravelly sands. Younger alluvium (Qya) was exposed at the westerly end of NT-4. (Figure 16, in map pocket)

5.6 Fault Trench NT-5:

This trench was excavated west of trench NT-3 and exposed the south branch of the CVFZ near station 1+15 (Plate 3). At this trench location, the south branch of the CVFZ places older alluvium against similar older alluvial units. Within the Qoa, reverse drag-folding was observed, particularly on the upper plate (northern) units. The measured trend of the main fault surface of the south branch at NT-5 is roughly N85W and dipping 33-43 degrees northeast (Figure 17, in map pocket). At NT-5, a zone of sub-parallel minor faulting was observed extending southerly to approx Station 1+65. This resulted in local widening of the structural setback (see geologic map). Analyses of historic aerial photographs confirm that the lack of soil development and unusually flat terrain in the vicinity of NT-5 is due to prior grading or agricultural use.

5.7 Fault Trench NT-6:

This trench was excavated west of trench NT-2 and exposed the south branch of the CVFZ near station 0+85 (Plates 4 and 5). At this trench location, the south branch of the CVFZ places older alluvium against differing older alluvial units. Within the Qoa, reverse drag-folding was observed, particularly on the upper plate (northern) units. In addition, the upper plate was pervasively sheared, faulted and fractured with extensive carbonate infill along these features (Plate 6). The north end of the trench exposed older alluvial units which were highly oxidized (5YR and 7.5YR hues) which were in un-faulted, erosional contact with relatively less oxidized, and probably younger (7.5YR to 10YR) older alluvial units. These less oxidized units were in fault contact with similar older alluvial (7.5YR to 10YR) units on the southern, lower plate. The measured trend of the main fault surface of the south branch at NT-6 is roughly N85W and dipping 24-26 degrees northeast (Figure 18, in map pocket). On our logs the more oxidized unit is denoted Qoa_1, and the less oxidized unit as Qoa_2. These units are not differentiated on the geologic map, due to unknown outcrop pattern. Analyses of historic aerial photographs confirm that the lack of soil development and unusually flat terrain in the vicinity of NT-6 is due to prior grading or agricultural use.

5.8 East Road Cut RC-1:

A fault outcropping within an existing road cut located near the eastern property boundary was observed by geologists from this firm during preliminary site reconnaissance. This road cut was mapped in detail to determine whether the fault located there was part of the south branch or other fault splays projected southeasterly along the trend of the north branch (Figure 19, in map pocket). The road cut was first cleaned with a Hitachi ZX450H and then detail-logged by geologists from this firm. The fault exposed in RC-1 was determined to be the South Branch of the CVFZ, which juxtaposes differing older alluvial units at this location.

The kinematics of the fault observed in RC-1 were very similar to those observed in other trenches (NT-2, NT5 and NT-6). All of these exposures displayed moderate to low angle faults (28-45 degree dips) with reverse-kinematic drag-folding, particularly evident within upper plate stratigraphic units. This data, coupled with previous locations from the CHJ trenching, confirms the east-west trend of the South Branch in the eastern portion of the property. This differed greatly with vertical faulting and localized vertical bedding observed on the North Branch of the CVFZ, which is still exposed in CHJ SC-4 (Plate 7).

Activity of Faulting:

During this fault investigation, N&A has not attempted to age-date the South Branch of the Cherry Valley fault or the North Branch of the Cherry Valley fault. This fault investigation concentrated on refining the location and attitude of the South Branch of the Cherry Valley fault in order to position future structures outside the restricted use zone at final grades. No unbroken datable soil horizons or other unbroken pre-holocene units were exposed in any of the N&A excavations. In addition, no carbon or datable materials were encountered in any of the excavations.

It is our opinion that there is no direct indisputable evidence to designate the South Branch and North Branch of the Cherry Valley fault, and any possible faults northeast of the South Branch of the Cherry Valley fault, as inactive. In addition, there is relatively strong geomorphic and topographic evidence that indicate that the Cherry Valley Fault Zone is potentially active. Consequently, N&A has delineated a setback for the South Branch and "Recommended Restricted Use Zone" from the South Branch extending to the north and northeast property line

as shown on Figure11. No evidence of faulting was observed southerly of the South Branch CVFZ in any of the excavations.

6.0 Review of previous work and analyses:

Previous reports and letters from CHJ were reviewed by geologists from this firm. Though the work done was fairly extensive, some aspects of the location and age-dating of faulting onsite were not made clear from our standpoint, and warranted futher study. These issues are listed and described below:

6.1 Fault Location

CHJ's trenches were spaced great distances apart and major changes in strike on faults exposed were not explained or investigated. The south branch changed in strike from N60-70W to nearly east-west between CHJ's excavations SC-3 and T-2. Outcrops to the north of SC-3 showed that the south branch maintained its strike and dip for over 2,200 lineal feet. The significant strike change was never confirmed or explained. In addition, a moderately strong lineament suggested that the fault continued at the N60-70W, 10NE orientation (Figure 9). Two structure contours were prepared using both N&A field mapping and the CHJ measured strikes and dips on the South Branch from Trench T-1B and road cuts SC-2 and SC-3 (N65-70W, 10-15NE), see Figure. 12. These structure contours also paralleled/coincided with many of the aforementioned lineaments and geomorphic anomalies observed during our aerial photo analysis. The structure contours also projected southerly of all 2005 CHJ fault trenches. GPS measurements (measured with Trimble GeoXT, sub-meter accuracy) of the outcrops along the South Branch also confirmed that the structure contour was representative of the hypothetical planar orientation and structure contour of the fault surface (Figure 12). In order to confirm that the South Branch or related faulting did not continue southeasterly from CHJ SC-3 and south of CHJ T-2 through T-4, we sited subsequent trenches along the structure contour and photo lineaments.

6.2 CHJ onsite Age Dating Techniques:

NORTH BRANCH, CHERRY VALLEY FAULT ZONE

The CHJ 2005 field study and report did not determine the status of activity of the North Branch of the Cherry Valley fault within the site and CHJ designated a recommended restricted use zone from a point 50 feet southwest of the trace of the North Branch to the northern and northeast property line (C.H.J. Inc., 8/3/05). The North Branch was not located beyond cut SC-4 (Figure 11, and Plate 7).

On Sept. 15, 2006, C.H.J. Inc. provided an update that removed the recommended restricted use zone for the North Branch. They determined that the North Branch is inactive based on the results of a nearby fault investigation performed by Leighton and Associates (L&A) dated Aug. 3, 2004. Leighton's study was done for a separate parcel, easterly adjacent to the subject site. The L&A trenches for the age-dating study of the North Branch were excavated over 2,900 feet east of the CHJ mapped/non-queried hard point location of the North Branch within the subject property and did not expose or locate any faults. It is our opinion that to accept that this is the same fault (North Branch, CVFZ) without any field confirmation over such a great distance, and to accept that fault's inactivity based on the L&A report does not adequately address the location or activity of faulting of the North Branch of the CVFZ on the subject site.

SOUTH BRANCH, CHERRY VALLEY FAULT ZONE

Age dating of the South Branch occurred at CHJ Trench FT-1B, in which localized fluviatile channel deposits appeared to be unbroken across the fault trace. The rationale for inactivity stated that the unbroken deposits were Pleistocene, due to their 2.5YR reddish Munsell hue. The inherent flaw with this "color based" age date/activity assessment is that 7.5YR hued older alluvial materials appear to underlie this fluvial cap conformably, and are in fault contact with the San Timoteo Formation. We feel that the capping fluvial unit likely had reddish source materials, which are common in the local outcrops of both older alluvium, and, to a lesser degree, in occasional red beds within the San Timoteo Formation, and that their age estimation is therefore dubious. The fact that the underlying alluvial materials in fault contact with the

San Timoteo Formation are less oxidized than the stratigraphically younger, un-faulted, reddish, capping material is supportive of our hypothesis.

In addition, there are dark reddish brown materials in the active alluvial channels throughout the site, due to upslope outcrops of reddish brown older alluvium as their source (see Plate 11). Consequently, we feel that solely using color as an indicator of age in this locality is not reliable. Local soil age estimates where the source material is highly oxidized should be accompanied by correlative evidence to support that the observed oxidation/rubefaction occurred in-situ and that the soil was not simply transported from the ancient, already oxidized source materials.

Leighton's fault investigations utilized aerial photo lineament analyses, fault trenching, radio-carbon age dating, the degree of weathering of cobbles and boulders, soil stratigraphic analyses, soil development index, and maximum horizon index. Based on N&A's review of their data and conclusions, we disagree that they have proven with indisputable evidence that the North and South Branch of the Cherry Valley fault are inactive.

The primary supporting evidence of fault activity age estimates reported in the L&A fault studies performed on the North Branch (2004) and the South Branch (2006) are similarly color/oxidation based, and additionally invoke the high degree of weathering of larger clasts (chiefly granitic and metamorphic cobbles and boulders) observed within the younger alluvium. Again, the upslope outcrops of older alluvial materials located northerly adjacent to L&A trenches is Munsell 2.5 YR to 5YR hue older alluvium (Plate 11), so the color of the material observed should not be used without other evidence to support the age estimation. The degree of weathering of larger fraction is also very problematic for use as evidence of age at this locality. There is an abundance of cobble to boulder size clasts, many of which exhibit extreme weathering/in-situ decomposition within both the older alluvial and the San Timoteo Formation conglomerate. These units comprise the vast majority of the immediate upslope alluvial sources onsite. As with the color based estimates, if the coarse fraction within the source rock exhibits the same properties with respect to weathering, then this weathering should not be invoked as an indication of age in the underlying alluvial materials.

Finally, the soil stratigraphic analyses performed by ECI for L&A are in direct conflict with Carbon-14 age dates derived from direct sampling of carbon fragments within the L&A Trench

T-1. They explain the age discrepancy by invoking bioturbation of both carbon samples. Their sample acquisition techniques are described in detail within the report and do not mention any evidence of contamination or bioturbation. We feel that to invoke bioturbation of both samples, after the carbon dates do not agree with the ECI soil-stratigraphic age estimation, is not consistent with the overall evidence.

The Carbon-14 dates from Trench T-1 at 6.5 feet deep(510±40 yrs B.P.) and at 12 feet deep (2990± 40 yrs. B.P.) do not seem unreasonable to N&A. Based on this firm's previous trenching and C-14 age dating experience in this and similar depositional environments, several feet of alluvial deposition can occur during a single rainstorm event.

It is our opinion that the base of the Holocene is likely to be found much deeper in the alluvium than the L&A trenches were excavated and may be in the 20 to 30 foot depth range.

In summary, it is the opinion of this firm that the previous age dating efforts performed by CHJ and the CHJ acceptance of nearby work by Leighton and Associates for the CVFZ (North and South Branches) are inconclusive. In addition, the evidence for recent faulting which include topographic and geomorphic expression, stream channel capture and migration, elevated terrace surfaces, and major stratigraphic offset of alluvial and bedrock materials, though not conclusive, are indicative of relatively modern activity.

7.0 Conclusions

Based on the results of this fault investigation using aerial photo lineament analyses, fault trenching, geologic field mapping, observation of exposed roadcuts, and review of previous fault investigations by others, Neblett and Associates has successfully located the South Branch of the CVFZ onsite (Figure 11). Our analyses have resulted in a structural setback zone located 50 feet south of, and 100 feet to the north of the South Branch. We have also established a Restricted Use Zone (RUZ) located north and northeast of the South Branch to the north and northeast property boundary (Figure 11). If habitable structures are proposed for this area, a through fault investigation comparable to that presented herein, will be required.

8.0 Future Work

Upon the development of a grading plan, this firm will be required to re-position the structural setback zone based on the proposed grades. The footprint of the proposed commercial structure can then be analyzed for conformance with the re-positioned structural setback and the restricted use zone.

Closure

We greatly appreciate the opportunity to provide our services and look forward to working you and the other project team members.

Repectfully submitted,

Project # 105-04

Attn: Mr. Brian Rupp
Project Manager

Subject: **Response to Review Comments by Riverside County,TLMA-Planning Regarding the I-10 Gateway Job Center, Project Parcel Map No. 36093, County of Riverside, California**

References: See attached List of References

Dear Mr. Rupp:

In accordance with your request, Ginter & Associates, Inc. (G&A) is providing this transmittal in response to the review comments provided by the County of Riverside, TLMA-Planning Department's Chief Engineering Geologist, Mr. David L. Jones and their geotechnical consultants, Geopacifica, concerning the response report by Neblett & Associates, Inc. (N&A) dated 7/29/2009 and the Grading Plan Review report by G&A dated 1/7/2013.

Riverside County Comment #1:

"As requested in the County's May 28, 2009 comments, comment #6, the consultant should explain how the lack of age dating of the onsite faults might affect development of the site (ground shaking potential probabilities, near source motions, etc.) See also consultant's "Additional Notes" provided in the Neblett & Associates, Inc. July 29, 2009 Response."

G&A Response to Comment #1:

The lack of age dating of the onsite faults should not affect the development of the site with respect to ground shaking, near-source motions or surface rupture. Any potential seismogenic movement on the Cherry Valley Fault Zone (CVFZ) will be manifested at depth (i.e. several miles in depth) and would probably not be visible or affect the near surface. Ground-shaking from potential movement on the CVFZ at depth will be masked and minimal compared to the ground-shaking caused by earthquakes on the San Andreas Fault to the east and the San Jacinto Fault to the west.

The articles referenced from the GSA concerning the San Gorgonio Pass were based on models utilizing various theories and scenarios. As of this date, no direct evidence for designating the CVFZ as "active" per the CGS mandate has been found to our knowledge. The authors of the referenced articles acknowledge that the San Andreas Fault Zone is a complex system of strike-slip and north-dipping thrust faults that transfer dextral-oblique slip through the San Gorgonio Pass region and that an as yet undermined amount of dextral slip is partitioned onto a number of structures in the San Gorgonio Pass. This may suggest that potential seismogenic movement at depth could be shared by the Banning Fault, CVFZ and other faults that could result in less ground-shaking with minor earthquake magnitudes.

Riverside County Comment #2:

"The consultant's response to the County's May 28, 2009 comments, comment #10 states: 'While faults may indeed underlie the site south of the mapped South Branch, our trenches did not expose any evidence of ground rupture or stratigraphic offset of beds within these middle Pleistocene older alluvial materials.' Please explain as the consultant did not trench the southern portion of the site. Also, please provide the necessary positive lines of evidence to support the presence or absence of active faults on the southern portion of this site."

G&A Response to Comment #2:

As in most of southern California, faults can be observed in outcrops and in bedrock concealed by surficial deposits that are commonly very old and much older than the Holocene. Consequently, the statement was made that south of older alluvium (Qoa) in the vicinity of the ridge where NT-4 was trenched, faults may be present that are currently concealed by younger alluvium (Qya).

The following are positive lines of evidence to support the absence of active faults in the southern portion of the site:

- No publications and/or geologic maps from federal, state, county or local agencies delineate any faults in this area of the site and on trend east and west of the site.

- Based on our aerial photo lineament analysis, no lineaments, including weak or tonal lineaments, were found within this area of the site or on trend east and west of the site.

- No geomorphic expression of faulting is present in this area of the site and on trend east and west of the site.

- Leighton's fault investigation (8/3/2004) and supplemental fault investigation (8/4/2006) for the easterly adjacent Danny Thomas Ranch indicated no evidence of faulting south of Station 0+60 in T-1 or within the entire length of T-3, which spanned the easterly projected suspect area of faulting questioned on the subject site.

- Leighton's aerial photograph review (8/3/2004) indicated no geomorphic expression was observed in the younger or older alluvial soils located within or south of the valley located east of the subject site.

- No evidence of faulting was encountered in the infiltration test pits, or the boring, that were located in the suspect area south of the older alluvium near NT-4.

Riverside County Comment #3:

"The consultant's response to the County's May 28, 2009 comments, comment #37 speaks to "critical structures". The consultant should consider using different terminology for the structure types allowed within the "Recommended Restricted Use Zone" and "Structural Setback". The term "critical structure" has a specific mean (e.g. fire station, hospital). Is the consultant suggesting other habitable structures can be placed on these areas?"

G&A Response to Comment #3:

We apologize for the "critical structures" terminology, which should be revised to read "habitable structures" for the Structural Setback Zone.

Likewise, the "Recommended Restricted Use Zone" can be utilized for non-habitable facilities, such as horse stables, soccer fields, etc. that will have less than 1,000 hrs. of human occupancy per year. Additional fault investigation in the future in this area would be required and approved by the controlling agencies to remove any portions of the restricted use zone for construction of potential habitable structures.

GEOTECHNICAL:

- In Section 7.6-Settlement in reference #2 the consultant provides the opinion that settlement will occur due to seismic activity, loading from fill placement and loading from proposed structures. The consultant also provided recommendations for settlement monuments for the deeper fill area. The consultant should provide anticipated settlement amounts and the justification for those numbers (laboratory testing, calculations, etc.). We require both the primary and secondary fill settlement amounts and time-frame. The County of Riverside would like to see no more than 1" static and 2" seismic settlement after ground modification measures have been performed.

G&A Response:

The planned mass grading of the site involves complete removal of the younger alluvium (Qya) and replacement with compacted fill. The maximum depth of proposed fill after removal of younger alluvium is approximately 80± vertical feet placed over older alluvium of approximately 100 feet in thickness. The areal loading from fill placement will cause settlement due to the compressibility of the fill and in place older alluvial materials.

A critical profile of 80 feet of compacted fill (after removal of 20 feet of younger alluvium) placed on top of 100 feet of older alluvium was considered in consolidation settlement calculation. A bulk density value of 125 pcf was considered for compacted fill as well as for older alluvium that will be left in place. Pre-consolidation pressures for soil layers in alluvium were conservatively assumed equal to the existing overburden pressures. Compression ratios for the older alluvium were obtained based on the average value from the consolidation tests performed by the previous consultant Neblett and Associates, Inc. and are summarized below:

Older Alluvium Sample Location	**Compression Ratio**	
	Rebound Curve Cer	**Virgin Curve Cec**
HS-1 at 35 feet	0.6 %	4.2 %
HS-2 at 30 feet	0.5%	2.5 %
HS-2 at 40 feet	0.6 %	3.3 %
HS-4 at 15 feet	0.6 %	2.7 %
HS-4 at 35 feet	0.7 %	2.4 %
Average	***0.6%***	***3.0 %***

Compression ratios for compacted engineered fill were assumed 0.5 % and 2.5 % for rebound curve and virgin curve, respectively. During grading, adequate samples should be obtained for each type of fill material in deep fill areas and consolidation testing should be performed to validate the consolidation characteristics assumed in our calculation.

Considering the maximum fill depth and anticipated consolidation characteristics of the fill and older alluvium, the computed primary consolidation settlement is on the order of 27-inches. The calculation sheet is included as an attachment. Due to the granular nature of the site soils, the majority of this settlement will occur during grading operations and long-term secondary settlement would be negligible.

The amount of remaining consolidation settlement after achieving finished grade elevation and the time frame of occurrence will depend on many factors, such as soil type, compressibility and permeability characteristics, initial density and moisture condition, ground water conditions, sequence of loading, and other factors. We recommend that the settlement monuments should be installed as soon as the finished grades are achieved in deep fill areas. After installation of settlement monuments, the Project Civil Engineer should survey the actual locations of the monuments and incorporate the locations in the project plans. Settlement monuments should be monitored by the Project Civil Engineer and the results be provided to the Project Geotechnical Engineer for evaluation. The monitoring program should be in accordance with the frequency recommended by the Project Geotechnical Engineer and should be continued until primary settlement is essentially complete. The recommended frequency of settlement monitoring is shown below:

Period	Monitoring Frequency
First month following installation	Weekly
1 -3 months	Bi-weekly
From 3 months to completion of Primary settlement	Monthly

The settlement monitoring frequency may be revised by the Project Geotechnical Engineer based on evaluation of the settlement data. The proposed settlement monitoring should be performed for a minimum duration of 6 months.

The Project Geotechnical Engineer should evaluate the magnitude and progress of settlements to determine if the primary settlements are complete and the long-term settlements have stabilized to acceptable limits. If the magnitude and rate of settlement

are excessive, it may be necessary to delay construction until primary consolidation has occurred and the rate of settlement has stabilized. One the amount and rate of settlement has reached acceptable limits, the subject areas will be released for construction of the planned improvements.

- Please provide an estimate of settlement due to seismic shaking.

G&A Response:

Seismically induced settlement consists of dry dynamic settlement (above ground water) and liquefaction-induced settlement (below groundwater). During a strong seismic event, seismically induced settlement can occur within loose to moderately dense, dry or saturated granular soils. In view of the absence of groundwater and the 200-300 ft. depth of the regional groundwater, the potential for liquefaction is considered remote. Complete removal of the younger alluvium (Qya) approximately 20ft. in depth and replacement with compacted engineered fill to the design grades is recommended. The native material underlain by the compacted fill or in the cut areas will consist of older alluvial sediments (Late Pleistocene Qoa) that are generally dense and consolidated due to their age (11,000 + years). Due to the dense nature of the underlying sediments, they are not considered greatly susceptible to dry dynamic seismic settlement. However, to be conservative, it would be reasonable to assume a seismic settlement of 0.5 inch for a 7.5 magnitude earthquake with a peak ground acceleration of 0.61g. The seismically induced settlement caused by ground shaking is expected to be generally uniform.

- The consultant, in reference #2 states, in Section 7.8 “Erosion/Debris Flows”, that the installation of designed devices to protect the slopes and control surface drainage will help “**mitigate”** the potential erosion and debris flow during storm event. Are there additional measures and devices which will “**eliminate**” the potential for debris flow and damage to improvements or structures. Please comment.

G&A Response:

This firm is unaware of any feasible devices that will “eliminate” the potential for debris flow and damage to improvements to structures. However, it is this firm’s opinion that the civil engineer’s plans indicate berms, debris basins and drainage swales, together with appropriate vegetation on slopes, will be employed in accordance with the standards of care and practice in the industry.

- Has the geotechnical consultant considered the Cherry Valley Fault trace a potential avenue for water seepage? Please comment.

G&A Response:

Based on the logs of fault trenches exposing the South Branch of the Cherry Valley Fault, the fault is "healed" with clay gouge material, which is impermeable and will not provide potential avenue for water seepage.

GEOLOGIC:

In reference #2, Section 3.4 "Site Faults" the consultant makes the statement "Though these two main breaks help define the zone, lineaments and geomorphic evidence suggest a zone of faulting and deformation associated with the CVFZ that may be as wide as 500-700 feet. With the consultants statements that the faults must be considered "potentially active" please provide additional justification for a structural setback recommended at 50 feet south of and 100 feet north and northeast of the south branch.

G&A Response:

G&A has taken a conservative approach and recommended a structural setback of 50 ft. south and 100 ft. north of the trace of the south branch of the CVFZ that transgresses the proposed development envelopes. Potential ground shaking, if it occurs, will be more intense on the upper plate of this thrust fault than the lower plate. Consequently, we propose a 50 ft. and 100 ft. structure setback on the lower and upper plate accordingly. Since no development is proposed north of this zone, G&A deems it unnecessary to provide any structural setbacks for the north branch of the CVFZ or others that may exist.

If you have any questions or require further information, please don't hesitate to contact us.

5.PLANNING. 4 DRT - GEO01442 (cont.) REQUIRED

approval. In addition, the following clarification and/or additional clarification shall also be submitted to the County Geologist for review and approval:

1.As requested in the County's May 28, 2009 comments, comment #6, the consultant should explain how the lack of age dating of the onsite faults might affect development of the site (ground shaking potential probabilities, near source motions, etc.). See also consultant's "Additional Notes" provided in the Neblett & Associates, Inc. July 29, 2009 Response.

2.The consultant's response to the County's May 28, 2009 comments, comment #10 states: "While faults may indeed underlie the site south of the mapped South Branch, our trenches did not expose any evidence of ground rupture or stratigraphic offset of beds within these middle Pleistocene older alluvial materials. Please explain as the consultant did not trench the southern portion of the site. Also, please provide the necessary positive lines of evidence to support the presence or absence of active faults on the southern portion of this site.

3.The consultant's response to the County's May 28, 2009 comments, comment #37 speads to "critical structures". The consultant should consider using different terminology for the structure types allowed within the "Recommended Restricted Use Zone" and "Structural Setback". The term "critical structure" has a specific meaning (eg. fire station, hospital). Is the consultant suggesting other habitable structures can be placed on these areas?

RIVERSIDE COUNTY PLANNING DEPARTMENT
GEOTECHNICAL AND GEOLOGIC REPORT REVIEW CHECK CORRECTIONS

GEO 1442#2

February 28, 2013
Revised April 10, 2013

Mr. David L. Jones
Planning Department
County of Riverside, California

On February 11 and April 9, 2013, I received and reviewed the following documents:

1. Response to Review Comments by Riverside County, TLMA-Planning Regarding the I-10 Gateway Job Center Project, Parcel map No. 36093, Cherry Valley Area, County of Riverside, CA, GEO 1442, by Neblett & Associates, Inc., dated July 29, 2009
2. Grading Plan Review, Parcel Map No. 36093, I-10 Gateway Job Center, Cherry Valley Area, County of Riverside, CA, by Ginter & Associated, dated January 7, 2013
3. Comments Concerning Neblett & Associates, Inc's Response to Review Comments by riverside county, TLMA-Planning Regarding the I-10 Gateway Job Center, Cherry Valley Area, Riverside County, CA by Ginter and Associated, dated January 7, 2013
4. Sensitivity of the Southern Sand Andreas Fault System to Tectonic Boundary conditions and Fault Configurations, by Justin Herbert and Michele Cooke, October, 2012
5. A New Perspective on the Geometry of the San Andreas Fault in Southern California and Its Relationship to Lithospheric Structure, by Gary Fuis, dated February 2012

I also utilized the following documents for the technical review of document 1:

3060
INDUSTRY ST
SUITE 105
OCEANSIDE
CA 92054
TEL: 760.721.5488
FAX: 760.721.5539

6. Technical Guidelines for Review of Geotechnical and Geologic Reports; County of Riverside, 2000 edition, Transportation and Land Management Agency, Building and Safety Department, Planning Department, Transportation Department.
7. Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117A, California Division of Mines and Geology, 1997, Revised 2008

The purpose of our review is to check that the submitted documents provide soil/geologic data/information to meet the standards of practice within, and guidelines for reports of, Riverside County, California and any requirements and standards set by the State of California for Geologic, Seismic and Engineering reports. As a note, acceptance and/or approval of the consultant report at the Planning level does not guarantee or constitute acceptance/approval for grading or a grading permit. Response to certain review items will be required at the submittal/review level for Building and Safety for acceptance/approval for grading and grading permits.

Based on our review the geotechnical documents #1-5, prepared and submitted for the proposed I-10 Job Center in the Cherry Valley Area of Riverside County, CA, GEO 1442 **does not** provide adequate soil/geologic data/information to meet the minimum Planning Department guidelines for Riverside County and **is not** approved for entitlement purposes. I have items that need clarification prior to approval:

GEOTECHNICAL

- In Section 7.6 – Settlement in reference #2 the consultant provides the opinion that settlement will occur due to seismic activity, loading from fill placement and loading from proposed structures. The consultant also provided recommendations for settlement monuments for the deeper fill areas. The consultant should provide anticipated settlement amounts and the justification for those numbers(laboratory testing, calculations, etc.). We require both the primary and secondary fill settlement amounts and time-frame. The County of Riverside would like to see no more that 1" static and 2" seismic settlement after ground modification measures have been performed.
- Please provide an estimate of settlement due to seismic shaking.
- The consultant, in reference #2 states, in Section 7.8 "Erosion/Debris Flows", that the installation of designed devices to protect the slopes and control surface drainage will help "**mitigate**" the potential erosion and debris flow during storm

GEOPACIFICA
GEOTECHNICAL CONSULTANTS

events. Are there additional measures and devices which will "**eliminate**" the potential for debris flow and damage to improvements or structures. Please comment.

- Has the geotechnical consultant considered potential stabilization fills for areas where the Cherry Valley Fault is exposed in cut slopes? Please comment.
- Does the geotechnical consultant consider the Cherry Valley Fault trace a potential avenue for water seepage? Please comment.

GEOLOGIC

- In reference #2, Section 3.4 "Site Faults" the consultant makes the statement "Though these two main breaks help define the zone, lineaments and geomorphic evidence suggest a zone of faulting and deformation associated with the CVFZ that may be as wide as 500-700 feet. With the consultants statements that the faults must be considered "potentially active" please provide additional justification for a structural setback recommended at 50 feet south of and 100 feet north and northeast of the south branch.

If you have any questions, please do not hesitate to contact us.

Respectfully,

James F. Knowlton

PLANNING DEPARTMENT

5.PLANNING. 4 DRT - GEO01442 REQUIRED

County Geologic Report (GEO) No. 1442, submitted for this site (APN: 413-270-012 & 013, 407-220-004, 007-9, 016, 017) (no current project application), was prepared by Neblett & Associates, Inc. and is entitled: "Fault Investigation, Tentative Tract No. 30545, GEO No. 1442, Cherry Valley Area, County of Riverside, California", dated September 22, 2008. In addition, the following reports were submitted for this GEO:

C.H.J. Incorporated, August 3, 2005, "Subsurface Investigation of Faulting, Cherry Valley Gateway project, Tentative Tract No. 30545, Northeast of Cherry Valley Boulevard and Interstate 10, Cherry Valley Area, Riverside County, California".

C.H.J. Incorporated, September 15, 2006, "Update to Subsurface Investigation of Faulting, Cherry Valley Gateway Project, 244+/- Acres Northeast of Cherry Valley Boulevard and Interstate 10, Cherry Valley Area, Riverside County, California".

Neblett & Associates, Inc., "Response to Review Comments by Riverside County, TLMA-Planning Regarding the I-10 Gateway Job Center Project, Parcel Map No. 36093, Cherry Valley Area, County of Riverside, California GEO No. 1442.

Ginter & Associates, Inc., June 26, 2012, "Updated Consultant of Record for the I-1o Gateway Job Center, Tentative Tract May (sic) No. 34863, Cherry Valley Area, County of Riverside, California Geo No. 1442"

Ginter & Associates, Inc., January 7, 2013, "Grading Plan Review, Parcel Map No. 36093, I-10 Gateway Job Center, Cherry Valley Area, County of Riverside, California"

These documents are herein incorporated as a part of GEO01442.

Prior to scheduling this project for public hearing, clarification and/or additional information, relative to the issues enumerated by Geopacifica in their February 28, 2013 Geotechnical Report Review Check Corrections memo, shall be submitted to the County Geologist for review and

PLOT PLAN:TRANSMITTED Case #: PP25337 Parcel: 407-220-017

5. DRT CORRECTIONS REQUIRED

5.PLANNING. 4 DRT - GEO01442 (cont.) REQUIRED

approval. In addition, the following clarification and/or additional clarification shall also be submitted to the County Geologist for review and approval:

1.As requested in the County's May 28, 2009 comments, comment #6, the consultant should explain how the lack of age dating of the onsite faults might affect development of the site (ground shaking potential probabilities, near source motions, etc.). See also consultant's "Additional Notes" provided in the Neblett & Associates, Inc. July 29, 2009 Response.

2.The consultant's response to the County's May 28, 2009 comments, comment #10 states: "While faults may indeed underlie the site south of the mapped South Branch, our trenches did not expose any evidence of ground rupture or stratigraphic offset of beds within these middle Pleistocene older alluvial materials. Please explain as the consultant did not trench the southern portion of the site. Also, please provide the necessary positive lines of evidence to support the presence or absence of active faults on the southern portion of this site.

3.The consultant's response to the County's May 28, 2009 comments, comment #37 speads to "critical structures". The consultant should consider using different terminology for the structure types allowed within the "Recommended Restricted Use Zone" and "Structural Setback". The term "critical structure" has a specific meaning (eg. fire station, hospital). Is the consultant suggesting other habitable structures can be placed on these areas?

GEOTECHNICAL AND GEOLOGIC REPORT REVIEW CHECK CORRECTIONS

GEO 1442#2

February 28, 2013
Revised April 10, 2013

Mr. David L. Jones
Planning Department
County of Riverside, California

On February 11 and April 9, 2013, I received and reviewed the following documents:

1. Response to Review Comments by Riverside County, TLMA-Planning Regarding the I-10 Gateway Job Center Project, Parcel map No. 36093, Cherry Valley Area, County of Riverside, CA, GEO 1442, by Neblett & Associates, Inc., dated July 29, 2009
2. Grading Plan Review, Parcel Map No. 36093, I-10 Gateway Job Center, Cherry Valley Area, County of Riverside, CA, by Ginter & Associated, dated January 7, 2013
3. Comments Concerning Neblett & Associates, Inc's Response to Review Comments by riverside county, TLMA-Planning Regarding the I-10 Gateway Job Center, Cherry Valley Area, Riverside County, CA by Ginter and Associated, dated January 7, 2013
4. Sensitivity of the Southern Sand Andreas Fault System to Tectonic Boundary conditions and Fault Configurations, by Justin Herbert and Michele Cooke, October, 2012
5. A New Perspective on the Geometry of the San Andreas Fault in Southern California and Its Relationship to Lithospheric Structure, by Gary Fuis, dated February 2012

I also utilized the following documents for the technical review of document 1:

3060
INDUSTRY ST
SUITE 105
OCEANSIDE
CA 92054
TEL: 760.721.5488
FAX: 760.721.5539

6. Technical Guidelines for Review of Geotechnical and Geologic Reports; County of Riverside, 2000 edition, Transportation and Land Management Agency, Building and Safety Department, Planning Department, Transportation Department.
7. Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117A, California Division of Mines and Geology, 1997, Revised 2008

The purpose of our review is to check that the submitted documents provide soil/geologic data/information to meet the standards of practice within, and guidelines for reports of, Riverside County, California and any requirements and standards set by the State of California for Geologic, Seismic and Engineering reports. As a note, acceptance and/or approval of the consultant report at the Planning level does not guarantee or constitute acceptance/approval for grading or a grading permit. Response to certain review items will be required at the submittal/review level for Building and Safety for acceptance/approval for grading and grading permits.

Based on our review the geotechnical documents #1-5, prepared and submitted for the proposed I-10 Job Center in the Cherry Valley Area of Riverside County, CA, GEO 1442 **does not** provide adequate soil/geologic data/information to meet the minimum Planning Department guidelines for Riverside County and **is not** approved for entitlement purposes. I have items that need clarification prior to approval:

GEOTECHNICAL

- In Section 7.6 – Settlement in reference #2 the consultant provides the opinion that settlement will occur due to seismic activity, loading from fill placement and loading from proposed structures. The consultant also provided recommendations for settlement monuments for the deeper fill areas. The consultant should provide anticipated settlement amounts and the justification for those numbers(laboratory testing, calculations, etc.). We require both the primary and secondary fill settlement amounts and time-frame. The County of Riverside would like to see no more that 1" static and 2" seismic settlement after ground modification measures have been performed.
- Please provide an estimate of settlement due to seismic shaking.
- The consultant, in reference #2 states, in Section 7.8 "Erosion/Debris Flows", that the installation of designed devices to protect the slopes and control surface drainage will help "**mitigate**" the potential erosion and debris flow during storm

GEOPACIFICA
GEOTECHNICAL CONSULTANTS

events. Are there additional measures and devices which will "**eliminate**" the potential for debris flow and damage to improvements or structures. Please comment.

- Has the geotechnical consultant considered potential stabilization fills for areas where the Cherry Valley Fault is exposed in cut slopes? Please comment.
- Does the geotechnical consultant consider the Cherry Valley Fault trace a potential avenue for water seepage? Please comment.

GEOLOGIC

- In reference #2, Section 3.4 "Site Faults" the consultant makes the statement "Though these two main breaks help define the zone, lineaments and geomorphic evidence suggest a zone of faulting and deformation associated with the CVFZ that may be as wide as 500-700 feet. With the consultants statements that the faults must be considered "potentially active" please provide additional justification for a structural setback recommended at 50 feet south of and 100 feet north and northeast of the south branch.

If you have any questions, please do not hesitate to contact us.

Project # 105-05

Attn: Mr. Brian Rupp

Subject: **Grading Plan Review**
For the Revised TPM# 36564
San Gorgonio Crossings,
County of Riverside, California

References: See attached List of References

Introduction:

The subject site, formerly known as the I-10 Gateway Job Center, is now called the San Gorgonio Crossings. The revised plan was prepared by Albert A. Webb Associates at a scale of 1"=80' dated 9/3/14 and is attached (in pockets).

The *Grading Plan Review, Parcel Map # 36093 I-10 Gateway Job Center* dated 1/7/13 and subsequent response dated 6/3/13 by Ginter & Associates, Inc. was approved by the Riverside County Planning Department on September 4, 2013. The geotechnical site conditions, recommendations and conclusions of these documents generally remain applicable unless superseded by the contents of this report.

The modifications to the plan by the designated project civil engineer warrant the presentation of the revised cross sections and geotechnical engineering analyses contained herein.

General Summary of Plan Design Changes:

- Removed Retaining Walls
- Decreased the area of the building footprints
- Modified slopes along the northern, southern, eastern and western perimeters
- Added two water tanks in the northeast portion
- Slightly re-positioned storm drain channels and WQMP infiltration basins

Revised Geotechnical Map and Cross Sections:

Cross sections 1-1" through 7'7" have been revised to reflect the revised grades. The geology shown on the sections has not changed.

The geotechnical map (Figure 1, enclosed in pocket) has been modified to reflect the re-positioning of some of the stabilization keyways, as shown on the pertinent cross sections.

Revised Slope Stability Analyses:

Revised global and surficial slope stability analyses were performed to evaluate the stability of the largest engineered fill slope (section7-7") and the largest cut slope in older alluvium (Section 3-3"). Detailed slope stability analyses are present in Appendix II. The results of the stability analyses indicate that the proposed slopes will provide factors of safety greater than 1.5 and 1.1 under static and pseudostatic conditions, respectively, conforming to the County of Riverside standards and are acceptable, as planned. Similarly, the factors of safety for the surficial stability conditions also meet the required minimum safety factor of 1.5.

Geotechnical Construction Recommendations:

All pertinent parties need to review the recommendations found in the referenced report dated January 7, 2013.

Plan Review, Observations, and Testing:

Ginter & Associates, Inc. should be provided with precise grading and foundation plans, when available, for our review to evaluate the preliminary recommendations presented herein and to develop additional/revised recommendations, as appropriate.

Field observation and testing during precise and remedial grading must be performed by a representative of this firm to verify conformance of the earthwork to the requirements of the regulating agencies, the project specifications, and the recommendations presented in this report. Any earthwork performed in connection with the subject project without the full knowledge of, and not under the direct observation of this firm, will render the recommendations of this report invalid.

Limitations:

This report and the report dated 1/7/13 have been prepared for the exclusive use of TSG Cherry Valley, L.P. and its design consultants relative to the design and construction of the proposed project. This report is not intended for other parties, and it may not contain sufficient information for other purposes.

The Owner or Owner Representative should make sure that the information and preliminary recommendations presented in this report and the 1/7/13 report are brought to the attention of the Project Architect and Project Engineer and incorporated into the project plans.

The findings contained in this report are based upon our evaluation and interpretation of the information obtained from limited borings and/or test pits and the results of the laboratory testing and engineering analysis. The opinions and recommendations provided were based on the assumption that the geotechnical conditions, which exist across the site, are similar to those observed in the test excavations. The condition and characteristics of the sub-surface materials at locations and depths other than those excavated and observed may be different and no representations are made as to their quality and engineering properties. Should any conditions encountered during construction differ from those described herein, this office should be contacted immediately for evaluation of the actual conditions and for appropriate recommendations prior to continuation of work.

The findings and recommendations presented herein were obtained in accordance with currently accepted professional engineering principles and practices in the field of geologic and geotechnical engineering and reflect our best professional judgment. We make no other warranty, either express or implied.

We thank you for the opportunity to provide our services for your project and look forward to working with you and the project team during site grading, design and construction. If you have any questions or require additional information, please contact the undersigned.

****

SLOPE STABILITY ANALYSIS SYSTEM
Modified Bishop, Simplified Janbu, or GLE Method of Slices.
(Includes Spencer & Morgenstern-Price Type Analysis)
Including Pier/Pile, Reinforcement, Soil Nail, Tieback,
Nonlinear Undrained Shear Strength, Curved Phi Envelope,
Anisotropic Soil, Fiber-Reinforced Soil, Boundary Loads, Water
Surfaces, Pseudo-Static & Newmark Earthquake, and Applied Forces.

****

Analysis Run Date: 11/18/2014
Time of Run: 12:42PM
Run By: Username
Input Data Filename: C:\SLOPE\CherryValley\Nov 2014\3-1.in
Output Filename: C:\SLOPE\CherryValley\Nov 2014\3-1.OUT
Unit System: English
Plotted Output Filename: C:\SLOPE\CherryValley\Nov 2014\3-1.PLT
PROBLEM DESCRIPTION: Section 3-3', I-10 Gateway Center, Cut Slope in Qoa, PN: 105-03, Static

BOUNDARY COORDINATES

Default Y-Plus Value = 0.00(ft)

ISOTROPIC SOIL PARAMETERS
2 Type(s) of Soil

Soil Type No.	Total Unit Wt. (pcf)	Saturated Unit Wt. (pcf)	Cohesion Intercept (psf)	Friction Angle (deg)	Pore Pressure Param.	Pressure Constant (psf)	Piez. Surface No.
1	120.0	120.0	200.0	30.0	0.00	0.0	0
2	120.0	120.0	250.0	32.0	0.00	0.0	0

A Critical Failure Surface Searching Method, Using A Random Technique For Generating Circular Surfaces, Has Been Specified.
4000 Trial Surfaces Have Been Generated.
200 Surface(s) Initiate(s) From Each Of 20 Points Equally Spaced Along The Ground Surface Between X = 100.00(ft)
and X = 225.00(ft)
Each Surface Terminates Between X = 300.00(ft)
and X = 600.00(ft)
Unless Further Limitations Were Imposed, The Minimum Elevation At Which A Surface Extends Is Y = 0.00(ft)
10.00(ft) Line Segments Define Each Trial Failure Surface.
Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Evaluated. They Are Ordered - Most Critical First.
* * Safety Factors Are Calculated By The Modified Bishop Method * *
Total Number of Trial Surfaces Attempted = 4000
Number of Trial Surfaces With Valid FS = 4000
Statistical Data On All Valid FS Values:
FS Max = 6.518 FS Min = 1.763 FS Ave = 3.043

Standard Deviation = 0.890 Coefficient of Variation = 29.25 %

SLOPE STABILITY ANALYSIS SYSTEM
Modified Bishop, Simplified Janbu, or GLE Method of Slices.
(Includes Spencer & Morgenstern-Price Type Analysis)
Including Pier/Pile, Reinforcement, Soil Nail, Tieback,
Nonlinear Undrained Shear Strength, Curved Phi Envelope,
Anisotropic Soil, Fiber-Reinforced Soil, Boundary Loads, Water
Surfaces, Pseudo-Static & Newmark Earthquake, and Applied Forces.

Sum of the Resisting Forces (including Pier/Pile, Tieback, Reinforcing Soil Nail, and Applied Forces if applicable) = 473742.28 (lbs)
Average Available Shear Strength (including Tieback, Pier/Pile, Reinforcing, Soil Nail, and Applied Forces if applicable) = 1594.17(psf)
Sum of the Driving Forces = 416726.72 (lbs)
Average Mobilized Shear Stress = 1402.31(psf)

```
Total length of the failure surface =     297.17(ft)
CAUTION - Factor Of Safety Is Calculated By The Modified Bishop
          Method. This Method Is Valid Only If The Failure Surface
          Approximates A Circular Arc.
        *** SEISMIC SLOPE DISPLACEMENT DATA ***
(Note: kv is set = zero for displacement calculations)
Seismic Yield Coefficient (ky) =  0.2707(g)
Calculated Newmark Seismic Displacement =   0.301(ft)
Non-Symmetrical Sliding Resistance Has Been Specified
for Downhill Sliding.
              **** END OF GSTABL7 OUTPUT ****

SLOPE STABILITY ANALYSIS SYSTEM
Modified Bishop, Simplified Janbu, or GLE Method of Slices.
(Includes Spencer & Morgenstern-Price Type Analysis)
Including Pier/Pile, Reinforcement, Soil Nail, Tieback,
Nonlinear Undrained Shear Strength, Curved Phi Envelope,
Anisotropic Soil, Fiber-Reinforced Soil, Boundary Loads, Water
Surfaces, Pseudo-Static & Newmark Earthquake, and Applied Forces.

A Critical Failure Surface Searching Method, Using A Random Technique For Generating Circular Surfaces, Has Been Specified.
4000 Trial Surfaces Have Been Generated.
200 Surface(s) Initiate(s) From Each Of 20 Points Equally Spaced
Along The Ground Surface Between X = 50.00(ft)
and X = 150.00(ft)
Each Surface Terminates Between X = 250.00(ft)
and X = 500.00(ft)
Unless Further Limitations Were Imposed, The Minimum Elevation
At Which A Surface Extends Is Y = 0.00(ft)
10.00(ft) Line Segments Define Each Trial Failure Surface.
Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Evaluated. They Are Ordered - Most Critical First.
* * Safety Factors Are Calculated By The Modified Bishop Method * *
Total Number of Trial Surfaces Attempted = 4000
Number of Trial Surfaces With Valid FS = 4000
Statistical Data On All Valid FS Values:
FS Max = 9.706 FS Min = 2.465 FS Ave = 4.537
Standard Deviation = 1.493 Coefficient of Variation = 32.92 %

SLOPE STABILITY ANALYSIS SYSTEM
Modified Bishop, Simplified Janbu, or GLE Method of Slices.
(Includes Spencer & Morgenstern-Price Type Analysis)
Including Pier/Pile, Reinforcement, Soil Nail, Tieback,
Nonlinear Undrained Shear Strength, Curved Phi Envelope,
Anisotropic Soil, Fiber-Reinforced Soil, Boundary Loads, Water
Surfaces, Pseudo-Static & Newmark Earthquake, and Applied Forces.

Analysis Run Date: 11/18/2014

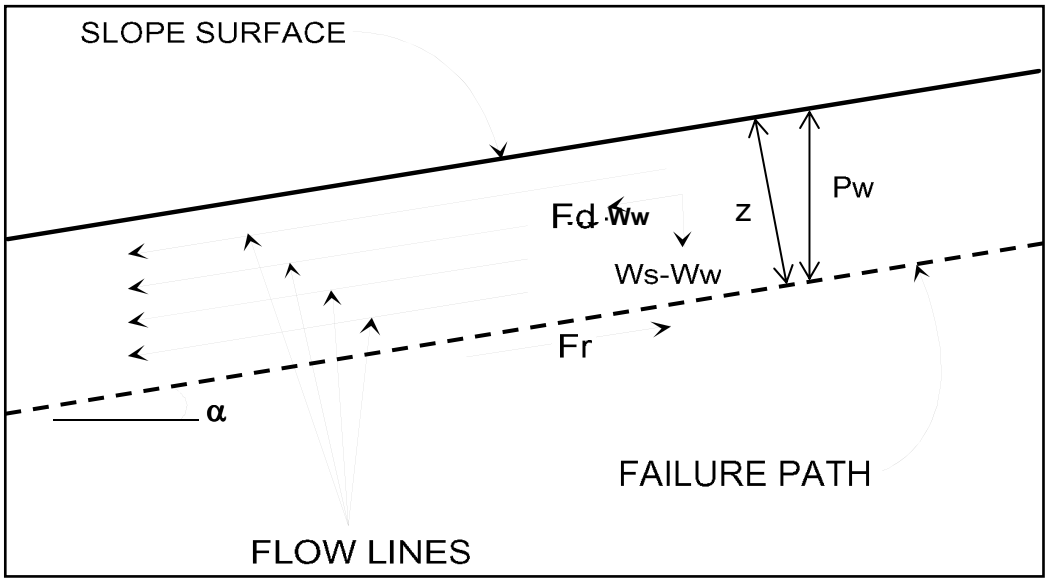
Sum of the Resisting Forces (including Pier/Pile, Tieback, Reinforcing Soil Nail, and Applied Forces if applicable) = 283406.72 (lbs)
Average Available Shear Strength (including Tieback, Pier/Pile, Reinforcing, Soil Nail, and Applied Forces if applicable) = 1293.16(psf)
Sum of the Driving Forces = 200125.45 (lbs)
Average Mobilized Shear Stress = 913.15(psf)
Total length of the failure surface = 219.16(ft)
CAUTION - Factor Of Safety Is Calculated By The Modified Bishop Method. This Method Is Valid Only If The Failure Surface Approximates A Circular Arc.

*** SEISMIC SLOPE DISPLACEMENT DATA ***
(Note: kv is set = zero for displacement calculations)
Seismic Yield Coefficient (ky) = 0.3803(g)
Calculated Newmark Seismic Displacement = 0.152(ft)
Non-Symmetrical Sliding Resistance Has Been Specified for Downhill Sliding.

**** END OF GSTABL7 OUTPUT ****

SURFICIAL SLOPE STABILITY



Assume: (1) Saturation To Slope Surface
(2) Sufficient Permeability To Establish Water Flow

P_w = Water Pressure Head=(z)(cos^2(α))
W_s = Saturated Soil Unit Weight
W_w = Unit Weight of Water (62.4 lb/cu.ft.)
u = Pore Water Pressure=(W_w)(z)(cos^2(α))
z = Layer Thickness
α = Angle of Slope
phi = Angle of Friction
c = Cohesion
F_d = (0.5)(z)(W_s)(sin(2α))
F_r = (z)(W_s-W_w)(cos^2(α))(tan(phi)) + c
Factor of Safety = F_r/F_d

Engineered Fill Slope

Given:

W_s (pcf)	c (psf)	ϕ (degrees)	z (ft)	Slope Ratio:	α (degrees)
120	200	30	4	2.0 :1	26.5

Calculations:

P_w	u	F_d	F_r	**Factor of Safety**
3.20	199.97	191.58	306.57	**1.60**

LAND USE / ZONING:

EXISTING LAND USE: VACANT
PROPOSED LAND USE: DISTRIBUTION CENTER
EXISTING ZONING: CONTROLLED DEVELOPMENT AREAS (W-2)
PROPOSED ZONING: INDUSTRIAL PARK (I-P)

ACERAGE:

GROSS SITE AREA: 229.98 AC.
NET SITE AREA: 225.03 AC.

LANDSCAPE AREA:

44.1% PROPOSED
10% REQUIRED
3,208,680 S.F. PROPOSED COVERAGE

EARTHWORK ESTIMATE:

CUT: 3,040,000 CY
FILL: 2,342,000 CY
SHRINKAGE: 5413,000 CY
NET: 185,000 CY EXPORT

UTILITY COMPANIES:

WATER: YUCAIPA VALLEY WATER DISTRICT
SEWER: YUCAIPA VALLEY WATER DISTRICT
ELECTRIC: SOUTHERN CALIFORNIA EDISON
TELEPHONE: VERIZON
GAS: SOUTHERN CALIFORNIA GAS COMPANY
CABLE: TIME WARNER CABLE

PROJECT DESCRIPTION:

THE SITE WILL INCLUDE THE DEVELOPMENT OF TWO WAREHOUSE/DISTRIBUTION BUILDINGS WITH 1,193,760 SQUARE FEET OF WAREHOUSE SPACE, 30,000 SQUARE FEET OF OFFICE SPACE, 531 TRUCK AND TRAILER PARKING SPACES, 706 AUTOMOBILE PARKING SPACES AND 306 LOADING DOCKS ON A 229.98 GROSS ACRE SITE.

LEGAL DESCRIPTION:

IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, BEING A PORTION OF THE NORTH HALF OF SECTION 30, TOWNSHIP 2 SOUTH, RANGE 1 WEST, SAN BERNARDINO MERIDIAN, ACCORDING TO THE OFFICIAL PLAT THEREOF.

EASEMENT NOTES:

(A) INDICATES AN EASEMENT IN FAVOR OF SOUTHERN CALIFORNIA EDISON COMPANY, FOR ELECTRICAL LINES AND INCIDENTAL PURPOSES, RECORDED APRIL 17, 1958 AS INSTRUMENT NO. 27945 IN BOOK 2257, PAGE 22, OF OFFICIAL RECORDS.

(B) INDICATES AN EASEMENT IN FAVOR OF SOUTHERN CALIFORNIA EDISON COMPANY, FOR ELECTRICAL LINES AND INCIDENTAL PURPOSES, RECORDED JULY 14, 1954 AS INSTRUMENT NO. 60488, OF OFFICIAL RECORDS.

(C) INDICATES AN EASEMENT IN FAVOR OF COUNTY OF RIVERSIDE, FOR MAINTENANCE, EMBANKMENT SLOPES AND INCIDENTAL PURPOSES,RECORDED JUNE 21, 1918 AS INSTRUMENT NO. 126809, OF OFFICIAL RECORDS.

(D) INDICATES AN EASEMENT IN FAVOR OF EVERETT L. HILLARD AND ETHEL M. HILLARD, FOR ROAD, PUBLIC UTILITIES AND INCIDENTAL PURPOSES, RECORDED OCTOBER 16, 1981 AS INSTRUMENT NO. 81-195388, OF OFFICIAL RECORDS.

Phase I Environmental Site Assessment

THIS PAGE INTENTIONALLY LEFT BLANK

R M Environmental, Inc.

Geology - Environmental - Geotechnical Engineering

April 6, 2009
Project No. 09-613

Mr. Brian Rupp
The Shopoff Group
8951 Research drive
Irvine, CA 92618

SUBJECT: **REPORT OF FINDINGS**
Updated Phase I Environmental Site Assessment
201± Acres, TSG Property
APNs 407-220-(004, 007-009, 014, 016, 017)
Cherry Valley Area, Riverside County, California

Dear Mr. Rupp:

1.0 INTRODUCTION

This report presents the findings of our updated Phase I Environmental Site Assessment (PSA) of the site conducted in accordance with our Proposal No. 09-009 dated March 19, 2009. The prior PSA of the site (RME, June 2007) had revealed no significant evidence of recognized environmental conditions pertaining to the site.

The purpose of this investigation was to further assess the potential for the presence or likely presence of hazardous substances or petroleum products on the property under conditions which indicate an existing release, a past release, or a material threat of a release of hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water in connection with the property.

The scope of work completed for this investigation included a field reconnaissance of the site and surrounding areas, record and document review, historic map and aerial photo review, and submittal of this report.

ACCOMPANYING MAPS AND APPENDICES
Figure 1 - Site Location Map
Figure 2 - Site Map

Appendix A - References
Appendix B - Selected Site Photographs
Appendix C - Transaction Screen Questionnaire
Appendix D - Site Assessment Data Report (EDR, dated May 7 and 22, 2007, and March 23 and 25, 2009)

2.0 SITE DESCRIPTION

The site consists of 201 ± acres of land located north of Cherry Valley Boulevard, Cherry Valley, Riverside County, California. The site is identified as Assessor Parcel Numbers (APNs) 407-220-(004, 007, 008, 009, 014, 016, 017). The geographic relationships of the site are shown on Figure 1 - Site Location Map.

Our field reconnaissance of the site for this investigation was performed between March 19 and 24, 2009.

2.1 General Site Description

The site consists of APNs 407-220-(004, 007, 008, 009, 014, 016, 017) located in the N 1/2 of Section 30, Township 2 South, Range 1 West, San Bernardino Base Meridian, Cherry Valley, County of Riverside, California.

The site currently consists of undeveloped land with miscellaneous dirt access roads. Several areas of miscellaneous non-hazardous debris were observed throughout the property. Two burned mobile trailers and miscellaneous non-hazardous debris were observed in the central portion of the site. A transmission waterline with associated structures was observed to traverse through the northern portion of the property. No additional site developments were observed on the subject property.

A site map is presented as Figure 2 - Site Map.

2.2 Current Site Operations

Currently, the entire site consists of undeveloped land with miscellaneous dirt access roads.

2.3 Surrounding Properties

The surrounding properties of the site were observed as sparse residential properties and undeveloped land to the north, an apparent drainage structure and agricultural land with an associated well to the east, Cherry Valley Boulevard to the south, and Windfall Farms ranch and undeveloped land to the east.

3.0 SITE RECONNAISSANCE/INTERVIEWS

3.1 Site Reconnaissance

The site reconnaissance for this investigation was performed between March 19 and 24, 2009. The site reconnaissance consisted of traversing the site in order to observe surficial soil conditions, structures, possible generators or storage of hazardous materials, drainage, land use, vegetation, and any notable surface conditions which would indicate the presence of hazardous waste or petroleum product contamination on or near the site.

3.2 Interviews

On March 20, 2009, our environmental assessor interviewed Mr. Randy Downing, property owner of a parcel located north and adjacent to the site. Mr. Downing indicated he had lived at his location for approximately nine years. According to Mr Downing, he had no knowledge of hazardous substances ever being present on the subject site. Mr. Downing also indicated he had no knowledge of any storage or use of petroleum substances on the subject property.

3.3 Transaction Screen Questionnaire

For this investigation, in accordance with ASTM E 1528, a Transaction Screen Questionnaire was completed by Mr. Randy Downing, adjacent property owner, and our environmental assessor performing this investigation. The completed questionnaires are included in Appendix C of this report.

4.0 RECORD AND DOCUMENT REVIEW

4.1 Government Agency Review

For this investigation, R M Environmental, Inc. (RME), retained the services of Environmental Data Resources, Inc. (EDR), to perform a database review in accordance with ASTM E1527-05 - *Standard Practice for Environmental Site Assessment: Phase I Environmental Site Assessment Process*. The EDR environmental database report is presented in Appendix D. The following environmental databases were reviewed by EDR for this environmental investigation:

- Federal- National Priority List (NPL), proposed and delisted NPL, Comprehensive Environmental Response, Compensation, and Liability Information (CERCLIS/CERC-NFRAP), Corrective Action Report (CORRACTS), Resource Conservation and Recovery Information System (RCRIS-TSD/LQG/SQG), Emergency Response Notification System (ERNS), Superfund (CERCLA) Consent Decrees, ROD, Facility Index System/Facility Identification Initiative Program Summary Report (FINDS), Hazardous Materials Information Reporting System (HMIRS), Material Licensing Tracking System (MLTS), Mines Master Index File (MINES), NPL Liens, PCB Activity Database System, Department of Defense Sites, RCRA Administrative Action Tracking System, Toxic Chemical Release Inventory System, Toxic Substances Control Act, Section 7 Tracking Systems, FIFRA/ TSCA Tracking System.

- State and Local- Annual Workplan Sites, Cal-Sites, Cortese, Notify 65, Toxic Pits, Solid Waste Information System, WMUDS/SWAT, LUST, Bond Expenditure Plan, Underground Storage Tank Facilities, Voluntary Cleanup Program Properties, INDIAN UST, CA FID UST, HIST UST, Aboveground Storage Tank Facilities (AST), Cleaner Facilities, Waste Discharge System, List of Deed Restrictions, No Further Action Determination, School Property Evaluation Program, Properties Referred to Another Agency, No Further Action Determination, Properties Needing Further Evaluation, CA SLIC, and HAZNET.

- Tribal Records- Indian LUST, Indian UST.

- EDR Proprietary Records- Manufacturing Gas Plants, EDR Historical Auto Stations, EDR Historical Cleaners.

Additional governmental agencies contacted by RME included the following:

- Riverside County Assessors Office

- Riverside County Department of Flood Control

4.2 Agency Findings

Information obtained by the database search and our governmental agency review indicated the following:

- No Federal, NPL, RCRA, CORRACTS,or TSD sites are located within 1 mile of the site;
- No known oil or gas wells are on record within 1 mile of the site;
- There are no known CAL-SITES (formerly ASPIS), CHMIRS, or HAZNET sites located within 1 mile of the site;
- There are no Solid Waste Facility/Landfill or LUST sites within ½ mile of the site.

The EDR environmental database report is presented in Appendix D.

From the records of Riverside County, the Assessor Parcel Numbers (APNs) of the site are 407-220-(004, 007, 008, 009, 014, 016, 017). The current owner of the site is recorded as Levinkel & TSG Cherry Valley, L.P., c/o William Shopoff.

4.3 Sanborn Map Report

Sanborn fire insurance maps consist of documented sites which previously or currently contain chemicals/substances that pose a possible increase in fire potential or threat.

For this investigation, a Sanborn fire insurance map search was conducted for the area north of Cherry Valley Boulevard, Cherry Valley, California. A copy of the Sanborn Map report is included in Appendix D of this report. No Sanborn Maps were found for the information submitted.

4.4 Environmental Lien Search

For the preparation of the referenced Phase I Environmental Assessment process of the site (RME, June 2007), an environmental lien search was conducted by Environmental Data Resources, Inc. (EDR) for APN 407-220-009 of the subject site. No environmental liens were identified for APN 407-220-009.

4.5 Review of Previous Environmental Investigations

In May 2007, R M Environmental, Inc., performed a Phase I Environmental Site Assessment of the subject property and the adjacent property (APNs 413-270-(012, 013)). The scope of work completed for the investigation included a field reconnaissance of the site and surrounding areas, personal interviews, record and document review, historic map and aerial photo review, selected soil sampling and laboratory analysis, evaluation of the data collected, and submittal of a report.

The findings of the above Phase I Environmental Site Assessment indicated no significant evidence of recognized environmental conditions pertaining to the site. No additional environmental investigation was recommended for the project site.

5.0 HISTORICAL SITE USAGE

Presented below is the historical review of the usage of the site based on historical maps and aerial photographs for the site.

5.1 Aerial Photograph Review

The referenced aerial photographs were carefully reviewed to evaluate past developments of the site. Based on this review, man-made developments of the site included the following:

Date of Flight	Comments
1938	The central and southern portions of the site were observed to be developed as agricultural land. The north portion of the site was observed as undeveloped. An apparent drainage wash was observed on the southern portion of the property, adjacent to Cherry Valley Boulevard. The surrounding properties were observed as undeveloped land to the north, west, and east, and Cherry Valley Boulevard (formerly Woodland Avenue) to the south.
May 25, 1949	An apparent irrigation reservoir, a horse ranch, and several apparent drainage structures were observed to border the subject site to the west. The site and remaining surrounding properties appeared similar to that observed in the 1938 photographs.
1953	The site and surrounding properties appeared similar to that observed in the 1949 photographs.
January 29, 1962	The hilly terrain throughout the site was observed to have been cleared of vegetation. The remaining site and surrounding properties appeared similar to that observed in the 1953 photographs.
1967	The site was observed as fallow agricultural land with terraces cleared of vegetation. Several apparent small structures were observed to border the site to the east. The remaining site and surrounding properties appeared similar to that observed in the 1962 photographs.
May 24, 1974	The irrigation reservoir and drainage structures formerly present to the west of the site were not observed. The site and remaining surrounding properties appeared similar to that observed in the 1967 photographs.

1980	The site and surrounding properties appeared similar to that observed in the 1974 photographs.
January 23, 1980	The site and surrounding properties appeared similar to that observed in the 1980 photographs.
February 23, 1984	Several residential structures were observed on the property north of the subject site. The site and remaining surrounding properties appeared similar to that observed in the 1980 photographs.
1990	The site and surrounding properties appeared similar to that observed in the 1984 photographs.
January 21, 1990	The site and surrounding properties appeared similar to that observed in the 1990 photographs.
1994	The site and surrounding properties appeared similar to that observed in the 1990 photographs.
January 30, 1995	The site and surrounding properties appeared similar to that observed in the 1994 photographs.
March 2, 2000	The site and surrounding properties appeared similar to that observed in the 1995 photographs.
2002	An apparent disturbance related to the placement of a water pipeline in the north portion of the site was observed. The remaining site and surrounding properties appeared similar to that observed in the 2000 photographs.
April 18, 2005	The site and surrounding properties appeared similar to that observed in the 2002 photographs.

Selected site aerial photographs are included in Appendix D.

5.2 Findings of Historic Maps

For this investigation, we reviewed the following historic maps of the project:

- 5,208-scale U.S.G.S. map, Perris Quadrangle, 15 Minute Series, dated 1943. The site appeared as undeveloped land with an apparent access road. An apparent drainage was observed to traverse the southern portion of the site.

- 2,000-scale U.S.G.S. map, El Casco Quadrangle, 7.5 Minute Series, dated 1953. The site appeared similar to that observed in the 1943 map.

- 2,000-scale U.S.G.S. map, El Casco Quadrangle, 7.5 Minute Series, dated 1967. The site appeared similar to that observed in the 1953 map.

- 2,000-scale U.S.G.S. map, El Casco Quadrangle, 7.5 Minute Series, dated 1967, photo-revised 1979. The site appeared similar to that observed in the 1967 map.

Copies of the historical topographic maps used for this investigation are included in Appendix D.

5.3 Site History

The site has reportedly been used for agricultural purposes dating back to the early 1930's. The reported site history and significant site usage includes:

* Prior 1938 - Prior 1967: The site appeared to be developed with agriculture fields

* 1980-Present: - The subject site consists of cleared/undeveloped land

Site history is based on historical maps and aerial photographs and information gathered from interviews. Several of the historical resources utilized for the review of the site history are included in Appendix D of this report.

6.0 SITE GEOLOGY/HYDROGEOLOGY

6.1 Site Geology

The site is located in the western margin of the San Gorgonio Pass between the Traverse Ranges Geomorphic Province to the north and the Peninsular Ranges Geomorphic Province to the south. Lateral displacement and uplift of the region has occurred on a series of major, northwest-trending faults which are thought to be related to the regional tectonic framework. Some of these fault zones have remained active to the present time which include the Cherry Valley Fault zone which is located approximately 1/4 to ½ mile to the northeast, the Banning Fault zone located approximately 2 miles to the northeast, the San Andreas Fault zone located approximately 7 miles to the northeast, and the San Jacinto Fault zone located approximately 8 miles to the southwest.

Locally, the site is underlain by several hundred feet of Quaternary age sedimentary deposits.

6.2 Hydrogeologic Setting

The site is located in the Singleton storage unit of the San Timoteo Creek Drainage Basin. Based on review of the "San Gorgonio Pass Water Agency - Engineer's Report on Water Conditions' (San Gorgonio Pass Water Agency, November 1997) and the Geocheck - Physical Setting Source Addendum to the EDR environmental database report for this project, the depth to the regional groundwater in the vicinity of the site is approximately 150 to 200 feet below the ground surface.

Two inactive groundwater wells (Well Nos. 1 & 2) are located west and adjacent to the site. Based on well measurements of Well No. 1 conducted on May 22, 2007, the depth to groundwater is approximately 195 feet below ground surface (bgs). In a conversation with Mr. Randy Downing, owner of property north and adjacent to the site, the depth to groundwater in wells located in Mr. Downing's property have varied from 50 to 100 feet bgs.

7.0 CONCLUSIONS AND OPINION

"We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527 of the TSG Property located north of Cherry Valley Boulevard, Cherry Valley, Riverside County, California [APNs 407-220-(004, 007-009, 014, 016, 017)], the property. Any exceptions to, or deletions from, this practice are described in Section 8.0 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property except for the following:"

* Areas of miscellaneous non-hazardous debris were observed on the subject property. These materials should be properly removed and disposed from the site prior to site development.

In the event that any hazardous materials are found during subsequent site operations, **R M Environmental, Inc.,** and the proper authorities should be notified immediately.

8.0 DATA GAPS

The information gathered for this investigation is presented in this report. Considering this information, several areas of gaps in data in regard to the site still remain. Listed below are the specific data gaps identified for this investigation and the significance of the missing data.

* An environmental lien search was not conducted for this investigation. Based on the findings of the prior PSA of the site (RME, June 2007), environmental liens were not identified for the site. It is our opinion, the absence of an additional environmental lien search is insignificant.

No additional data gaps are know for the subject property.

9.0 LIMITS OF INVESTIGATION

This Phase I Environmental Site Assessment was performed using the degree of care and skill ordinarily exercised under similar circumstances by engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

In preparing this report, we were provided information derived from secondary sources and personal interviews. Except as described in this report, we have made no independent investigation as to the accuracy or completeness of the information derived from these sources. We have assumed the information provided to us by our sources was accurate and complete.

10.0 QUALIFICATIONS & SIGNATURE

"We declare that, to the best of our knowledge and belief, we meet the definition of Environmental Professional as defined in §312.21 of this part."

"We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312."

The opportunity to be of service is sincerely appreciated. If you have any questions, please call us at (909) 446-0041.

Sincerely,

R M ENVIRONMENTAL, INC.,

Question — ~~Owner~~ — Occupants (if applicable) — Observed During Site Visit

Question	Owner			Occupants (if applicable)			Observed During Site Visit		
1. Is the *property* or any *adjoining property* used for an industrial use?	*Yes*	*No* ✓	*Unk*	*Yes*	*No*	*Unk*	*Yes*	*No*	*Unk*
2. *To the best of your knowledge, has the property* or any *adjoining property* been used for an industrial use in the past?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
3. Is the *property* or any *adjoining property used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing or recycling facility?*	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
4. To the best of your knowledge has the *property* or any *adjacent property* been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
5. Are there currently, or to the best of your knowledge have there been previously, any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of greater than 5 gal(19L) in volume or 50 gal(190L) in the aggregate, stored on or used at the *property* or at the facility?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
6. Are there currently, or to the best of your knowledge have there been previously, any industrial *drums* (typically 55 gal(208 L) or sacks of chemicals located on the *property* or at the facility?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
7. Has *fill dirt* been brought onto the *property* that originated from a contaminated site or that is of an unknown origin?	Yes	No	Unk ✓	Yes	No	Unk	Yes	No	Unk
8. Are there currently, or to the best of your knowledge have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal?	Yes	No	Unk ✓	Yes	No	Unk	Yes	No	Unk
9. Is there currently, or to the best of your knowledge has there been previously, any *stained soil* on the *property*?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
10. Are there currently, or to the best of your knowledge have there been previously, any registered or unregistered *storage tanks* (above or underground) located on the *property*?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk
11. Are there currently, or to the best of your knowledge have there been previously, any *vent pipes, fill pipes, or access ways* indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property*?	Yes	No ✓	Unk	Yes	No	Unk	Yes	No	Unk

12. Are there currently, or to the best of your knowledge have there been previously, any *flooring, drains, or walls* located within the facility that are stained by substances other than water or are emitting foul odors?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
13. If the *property* is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well be designated as contaminated by any government environmental/health agency?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
14. Does the *owner* or *occupant* of the *property* have any knowledge of *environmental liens* or governmental notification relating to past or recurrent violations of environmental laws with respect to the *property* or any facility located on the *property*?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
15. Has the *owner* or *occupant* of the *property* been informed of the past or current existence of *hazardous substances* or *petroleum products* or environmental violations with respect to the *property* or any facility located on the *property*?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
16. Does the *owner* or *occupant* of the *property* have any knowledge of any *environmental site assessment* of the *property* or facility that indicated the presence of *hazardous substances* or *petroleum products* on, or contamination of, the *property* or recommended further assessment of the *property*	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
17. Does the *owner* or *occupant* of the *property* know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any *hazardous substance* or *petroleum products* involving the *property* by any *owner* or *occupant* of the *property*?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
18. Does the *property* discharge waste water on or adjacent to the *property* other than storm water into a sanitary sewer system?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
19. To the best of your knowledge, have any *hazardous substances* or *petroleum products*, unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the *property*?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk
20. Is there a *transformer, capacitor*, or any hydraulic equipment for which there are any records indicating the presence of PCBs?	Yes	No	Unk	Yes	No	Unk	Yes	No	Unk

The EDR FieldCheck®System enables EDR's customers to make certain online modifications to the maps and text contained in EDR Radius Map Reports. As a result, the maps and text contained in this Report may have been so modified. EDR has not taken any action to verify any such modifications, and this report and the findings set forth herein must be read in light of this fact. The EDR FieldCheck System accesses user-modified records from previously submitted reports. Any user-modified record from a previous report that is plotted outside the search radius of this report may not be included in this report.

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

CVAR_09974

EXECUTIVE SUMMARY

A search of the environmental records was conducted by Environmental Data Resources, Inc. (EDR). RM ENVIRONMENTAL used the EDR FieldCheck System to review and/or revise the results of this search, based on independent data verification by RM ENVIRONMENTAL. The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 09/29/2008
Date Data Arrived at EDR: 10/10/2008
Date Made Active in Reports: 11/19/2008
Number of Days to Update: 40

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/29/2008

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 09/29/2008
Date Data Arrived at EDR: 10/10/2008
Date Made Active in Reports: 11/19/2008

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/07/2008
Date Data Arrived at EDR: 10/16/2008
Date Made Active in Reports: 12/08/2008

Next Scheduled EDR Contact: 04/13/2009
Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 12/03/2007
Date Data Arrived at EDR: 12/06/2007

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Transporters, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Local Lists of Hazardous waste / Contaminated Sites

CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

TSP PROPERTY - SHOPOFF
NORTH OF CHERRY VALLEY BLVD.
CHERRY VALLEY, CA 92320

TARGET PROPERTY COORDINATES

Latitude (North):	33.97200 - 33° 58' 19.2"
Longitude (West):	117.0231 - 117° 1' 23.2"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	497866.0
UTM Y (Meters):	3758857.2
Elevation:	2440 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	33117-H1 EL CASCO, CA
Most Recent Revision:	1979

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

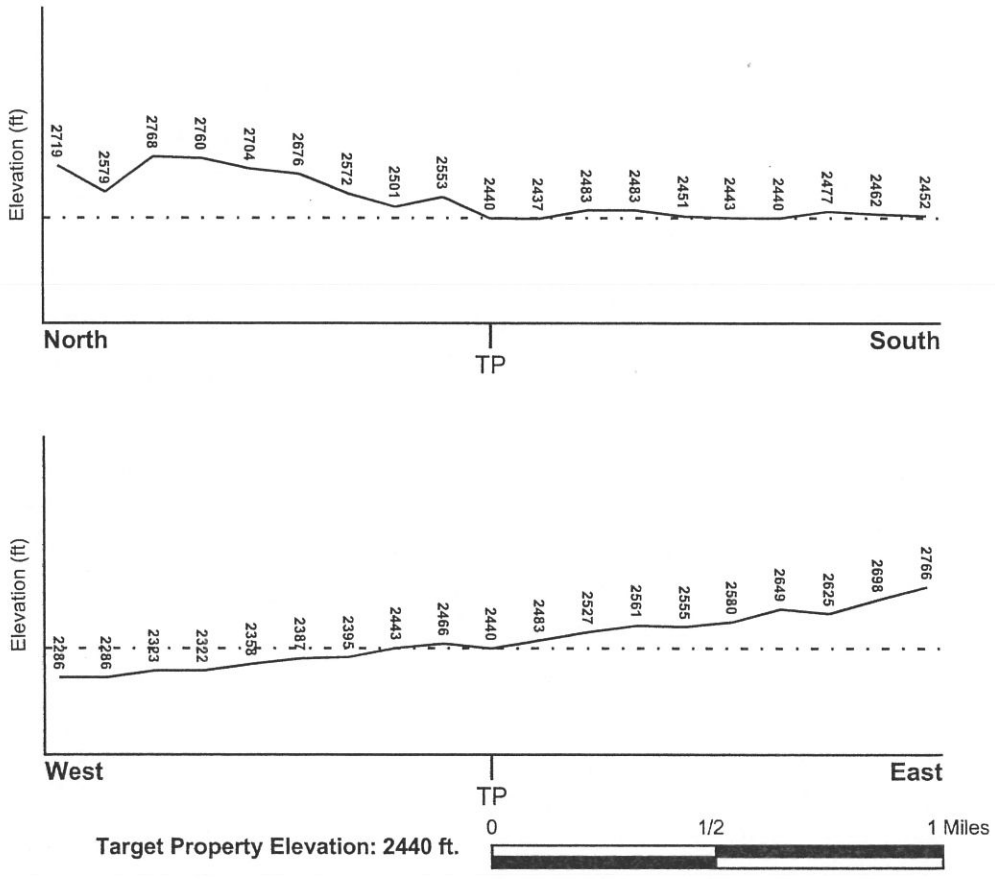
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

CVAR_10029

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
RIVERSIDE, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0602450785A

Additional Panels in search area: 0607400000A

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
EL CASCO	Not Available

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6
2	7 inches	40 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6
3	40 inches	59 inches	stratified loamy sand to coarse sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 7.8 Min: 5.6

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: Terrace escarpments

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: RAMONA

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
2	14 inches	22 inches	fine sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
3	22 inches	68 inches	sandy clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6
4	68 inches	74 inches	gravelly sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.6

Soil Map ID: 4

Soil Component Name: HANFORD

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

The Sanborn Library includes more than 1.2 million Sanborn fire insurance maps, which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ✓ Library of Congress
- ✓ University Publications of America
- ✓ EDR Private Collection

Limited Permission To Make Copies

RM Environmental (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

www.edrnet.com

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Historical Topographic Map Report

Environmental Data Resources, Inc.s (EDR) Historical Topographic Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topographic Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the early 1900s.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Environmental LienSearch™ Report

The EDR Environmental LienSearch Report includes results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers follows established procedures to:

- search for parcel information, legal description, and ownership based on client supplied address information;
- research indexes and title repositories;
- obtain a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument (title, parties involved, and description); and
- provide a copy of the deed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Title Order Number:
File Number: NHRV-1276397

Exhibit "A"

Real property in the unincorporated area of the County of Riverside, State of California, described as follows:

PARCEL 1: (APNS: 407-220-008 AND 009)

THE NORTH HALF OF THE NORTHEAST QUARTER, AND THE NORTHEAST QUARTER OF THE NORTHWEST QUARTER OF FRACTIONAL SECTION 30, TOWNSHIP 2 SOUTH, RANGE 1 WEST, SAN BERNARDINO BASE AND MERIDIAN, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, ACCORDING TO THE OFFICIAL PLAT THEREOF:

EXCEPT THAT PORTION DESCRIBED IN PARCEL 3 HEREIN.

PARCEL 2: (APNS: 407-220-014, 016 AND 017)

THE SOUTH HALF OF THE NORTHEAST QUARTER AND THE SOUTHEAST QUARTER OF THE NORTHWEST QUARTER OF FRACTIONAL SECTION 30, TOWNSHIP 2 SOUTH, RANGE 1 WEST, SAN BERNARDINO BASE AND MERIDIAN, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, ACCORDING TO THE OFFICIAL PLAT THEREOF:

EXCEPT THE SOUTHERLY RECTANGULAR 50.00 FEET OF SOUTHEAST QUARTER OF THE NORTHWEST QUARTER OF SAID FRACTIONAL SECTION 30, AS GRANTED TO THE COUNTY OF RIVERSIDE, BY DEED RECORDED NOVEMBER 22, 1949 IN BOOK 1125 PAGE 431 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA;

ALSO EXCEPT THAT PORTION DESCRIBED IN PARCEL 3 HEREIN;

ALSO EXCEPT THAT PORTION DESCRIBED IN THE DEED TO THE COUNTY OF RIVERSIDE RECORDED JUNE 21, 1978 AS INSTRUMENT NO. 126809 OF OFFICIAL RECORDS OF RIVERSIDE COUNTY, CALIFORNIA.

PARCEL 3: (APNS: 413-270-012 AND 013; 407-220-004 AND 007)

LOTS 72, 73 AND K TOGETHER WITH PORTIONS OF LOTS 67, 68, 69, 70, 71, 76 AND M IN BLOCK 4 OF KADOTA CITY FIG GROVES, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, AS SHOWN BY MAP ON FILE IN BOOK 13 PAGE 53 OF MAPS, RECORDS OF RIVERSIDE COUNTY, CALIFORNIA, AND A PORTION OF THE NORTHWEST QUARTER OF SECTION 30, TOWNSHIP 2 SOUTH, RANGE 1 WEST, SAN BERNARDINO BASE AND MERIDIAN, IN THE COUNTY OF RIVERSIDE, STATE OF CALIFORNIA, ACCORDING TO THE OFFICIAL PLAT THEREOF, DESCRIBED AS A WHOLE AS FOLLOWS:

BEGINNING AT THE SOUTHEAST CORNER OF LOT 74 IN BLOCK 4 OF SAID KADOTA CITY FIG GROVES; THENCE NORTH 00° 22' 25" EAST, 1, 144.28 FEET ON THE WEST LINES OF SAID LOTS M AND K;

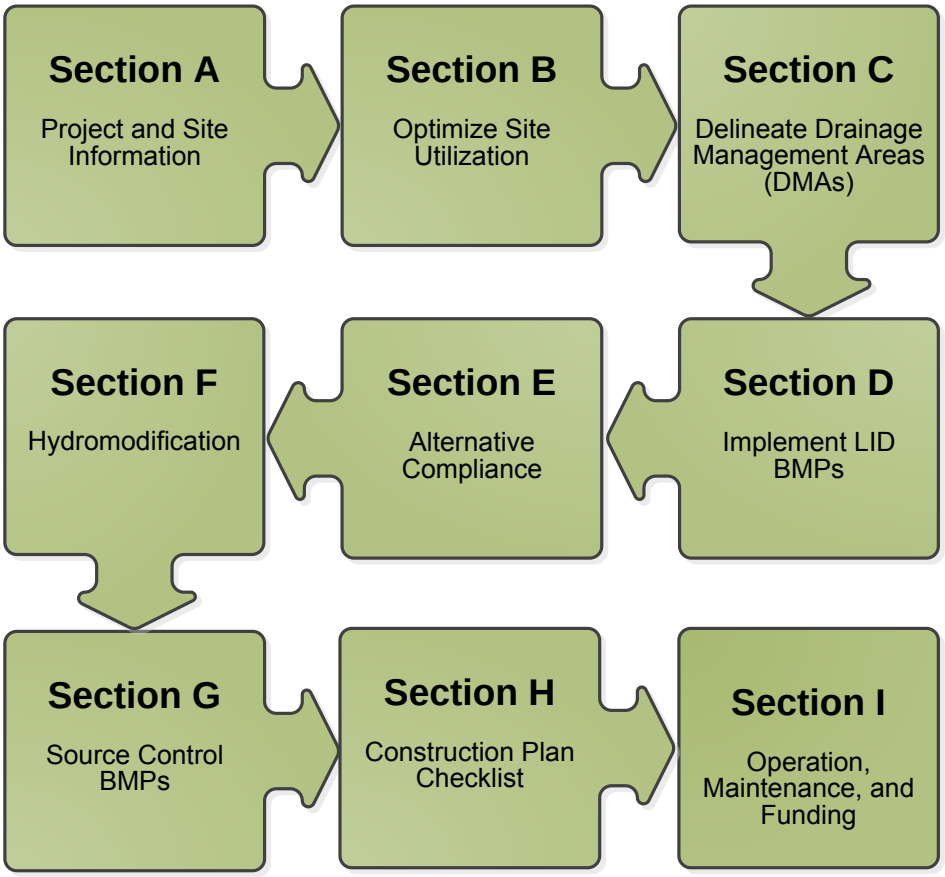
Revision Date(s):

Prepared for Compliance with
Regional Board Order No. **R8-2010-0033**

A Brief Introduction

This Project-Specific WQMP Template for the **Santa Ana Region** has been prepared to help guide you in documenting compliance for your project. Because this document has been designed to specifically document compliance, you will need to utilize the WQMP Guidance Document as your "how-to" manual to help guide you through this process. Both the Template and Guidance Document go hand-in-hand, and will help facilitate a well prepared Project-Specific WQMP. Below is a flowchart for the layout of this Template that will provide the steps required to document compliance.



OWNER'S CERTIFICATION

This Project-Specific Water Quality Management Plan (WQMP) has been prepared for ***TSG Cherry Valley, L.P. C/O The Shopoff Group*** by ***Albert A. Webb Associates*** for the ***Shopoff Realty Investments – San Gorgonio Crossings*** project.

This WQMP is intended to comply with the requirements of ***the County of Riverside*** for ***County of Riverside Ordinance No. 745*** which includes the requirement for the preparation and implementation of a Project-Specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation and funding of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. In addition, the property owner accepts responsibility for interim operation and maintenance of Stormwater BMPs until such time as this responsibility is formally transferred to a subsequent owner. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity. The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under ***County of Riverside Water Quality Ordinance*** (Municipal Code ***Chapter 13.12 – Stormwater Drainage System Protection Regulations***).

"I, the undersigned, certify under penalty of law that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

What is the Water Quality Design Storm Depth for the project?	0.79”

The Shopoff – San Gorgonio Crossings project proposes to develop approximately 150 acres of vacant land. The project is located northeast of the intersection of I-10 and Cherry Valley Boulevard. The project proposes to build 2 warehouse/distribution facilities totaling approximately 1,819,000 SF with associated parking, loading docks, drive aisles, and landscaped areas.

The site is presently vacant with little vegetation. Elevations on the site vary from 2580 feet above mean sea level (MSL) to 2390 feet. The existing site drains to a natural channel which conveys the runoff to the west to a basin west of Roberts Street which conveys the water to San Timoteo Creek. The proposed site will replace the natural channel with an improved channel which will continue to convey off-site flows and treated on-site flows to the west toward the basin west of Roberts Street. The northerly off-site flows will be conveyed to the west by a channel and will not enter the site. All flows will continue to reach San Timoteo Creek.

The Design Capture Volume will be treated by 2 Extended Detention Basins. In general, each building with associated parking, loading docks, drive aisles, and landscaped areas drain to its respective Extended Detention Basin. Both basins are located in fill and treat very large areas so infiltration and

bio-retention were not feasible treatment options for this project. The project is required to mitigate the Hydrological Conditions of Concern. The Extended Detention Basins will also mitigate these increased flows.

A.1 Maps and Site Plans

When completing your Project-Specific WQMP, include a map of the local vicinity and existing site. In addition, include all grading, drainage, landscape/plant palette and other pertinent construction plans in Appendix 2. At a **minimum**, your WQMP Site Plan should include the following:

- Drainage Management Areas
- Proposed Structural BMPs
- Drainage Path
- Drainage Infrastructure, Inlets, Overflows
- Source Control BMPs
- Buildings, Roof Lines, Downspouts
- Impervious Surfaces
- Standard Labeling

Use your discretion on whether or not you may need to create multiple sheets or can appropriately accommodate these features on one or two sheets. Keep in mind that the Co-Permittee plan reviewer must be able to easily analyze your project utilizing this template and its associated site plans and maps.

A.2 Identify Receiving Waters

Using Table A.1 below, list in order of upstream to downstream, the receiving waters that the project site is tributary to. Continue to fill each row with the Receiving Water's 303(d) listed impairments (if any), designated beneficial uses, and proximity, if any, to a RARE beneficial use. Include a map of the receiving waters in Appendix 1.

Table A.1 Identification of Receiving Waters

Receiving Waters	EPA Approved 303(d) List Impairments	Designated Beneficial Uses	Proximity to RARE Beneficial Use
San Timoteo Creek Reach 3 (HUC 801.62)	N/A	GWR, MUN, REC1, REC2, WARM, WILD	N/A
San Timoteo Creek Reach 2 (HUC 801.61)	N/A	GWR, MUN, REC1, REC2, WARM, WILD	N/A
San Timoteo Creek Reach 1B (HUC 801.52)	N/A	MUN, AGR, GWR, REC1, REC2, WARM, WILD	N/A
San Timoteo Creek Reach 1A (HUC 801.52)	N/A	AGR, MUN, REC1, REC2, WARM, WILD	N/A
Santa Ana Reach 5 (HUC 801.52)	N/A	AGR, GWR, MUN, RARE, REC1, REC2, WARM, WILD	17 miles
Santa Ana Reach 4 (HUC 801.44)	Salinity, TDS, Chlorides, Pathogens	WARM, WILD, GWR, MUN, RARE, REC1, REC2, SPWN	18 miles
Santa Ana Reach 3 (HUC 801.21)	Copper, Lead, Pathogens	AGR, GWR, MUN, RARE, REC1, REC2, SPWN, WARM, WILD	25 miles
Prado Basin Management Zone	Nutrient, Pathogens	MUN, REC1, REC2, WARM, WILD, RARE	40 miles

A.3 Additional Permits/Approvals required for the Project:

Table A.2 Other Applicable Permits

Agency	Permit Required	
State Department of Fish and Game, 1602 Streambed Alteration Agreement	☐ Y	☒ N
State Water Resources Control Board, Clean Water Act (CWA) Section 401 Water Quality Cert.	☐ Y	☒ N
US Army Corps of Engineers, CWA Section 404 Permit	☐ Y	☒ N
US Fish and Wildlife, Endangered Species Act Section 7 Biological Opinion	☐ Y	☒ N
Statewide Construction General Permit Coverage	☒ Y	☐ N
Statewide Industrial General Permit Coverage	☐ Y	☒ N
Western Riverside MSHCP Consistency Approval (e.g., JPR, DBESP)	☐ Y	☒ N
Other *(please list in the space below as required)*	☐ Y	☒ N

If yes is answered to any of the questions above, the Co-Permittee may require proof of approval/coverage from those agencies as applicable including documentation of any associated requirements that may affect this Project-Specific WQMP.

Section B: Optimize Site Utilization (LID Principles)

Review of the information collected in Section 'A' will aid in identifying the principal constraints on site design and selection of LID BMPs as well as opportunities to reduce imperviousness and incorporate LID Principles into the site and landscape design. For example, **constraints** might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, utility locations or safety concerns. **Opportunities** might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention BMPs), and differences in elevation (which can provide hydraulic head). Prepare a brief narrative for each of the site optimization strategies described below. This narrative will help you as you proceed with your LID design and explain your design decisions to others.

The 2010 Santa Ana MS4 Permit further requires that LID Retention BMPs (Infiltration Only or Harvest and Use) be used unless it can be shown that those BMPs are infeasible. Therefore, it is important that your narrative identify and justify if there are any constraints that would prevent the use of those categories of LID BMPs. Similarly, you should also note opportunities that exist which will be utilized during project design. Upon completion of identifying Constraints and Opportunities, include these on your WQMP Site plan in Appendix 1.

Site Optimization

The following questions are based upon Section 3.2 of the WQMP Guidance Document. Review of the WQMP Guidance Document will help you determine how best to optimize your site and subsequently identify opportunities and/or constraints, and document compliance.

Did you identify and preserve existing drainage patterns? If so, how? If not, why?

The existing drainage patterns have been identified and it has been determined that the overall drainage patterns will be preserved with a few on-site modifications. The existing site drains to a natural channel which conveys the runoff to the west to a basin west of Roberts Street which conveys the water to San Timoteo Creek. The proposed site will replace the natural channel with an improved channel which will continue to convey off-site flows and treated on-site flows to the west toward the basin west of Roberts Street. The northerly off-site flows will be conveyed to the west by a channel and will not enter the site. All flows will continue to reach San Timoteo Creek.

Did you identify and protect existing vegetation? If so, how? If not, why?

The existing vegetation was identified and it was determined infeasible to protect. The site is currently vacant with little or no vegetation. Approximately 41% of the developed site will be landscaped.

Did you identify and preserve natural infiltration capacity? If so, how? If not, why?

It is not feasible to preserve the natural infiltration capacity due to much of the proposed site being located on fill. Landscaped areas on the north and south will be self-treating pervious areas which will allow for infiltration to the extent the underlying on-site soil can accommodate.

Did you identify and minimize impervious area? If so, how? If not, why?

Yes, impervious area was minimized given the proposed site usage and required materials. The minimum landscaping pervious cover was achieved, per code.

Did you identify and disperse runoff to adjacent pervious areas? If so, how? If not, why?

Runoff will be dispersed to the Extended Detention Basins. Also, landscaped areas on the north and south will be self-treating pervious areas which will convey the flows generated by the respective areas directly off-site.

Section C: Delineate Drainage Management Areas (DMAs)

Utilizing the procedure in Section 3.3 of the WQMP Guidance Document which discusses the methods of delineating and mapping your project site into individual DMAs, complete Table C.1 below to appropriately categorize the types of classification (e.g., Type A, Type B, etc.) per DMA for your project site. Upon completion of this table, this information will then be used to populate and tabulate the corresponding tables for their respective DMA classifications.

Table C.1 DMA Classifications

DMA Name or ID	Surface Type(s)[1]	Area (Sq. Ft.)	DMA Type
DMA A	Roofs, Ornamental Landscaping, Concrete or Asphalt	1,886,088	D
DMA B	Roofs, Ornamental Landscaping, Concrete or Asphalt	2,643,975	D

[1] *Reference Table 2-1 in the WQMP Guidance Document to populate this column*

Table C.2 Type 'A', Self-Treating Areas

DMA Name or ID	Area (Sq. Ft.)	Stabilization Type	Irrigation Type (if any)
DMA A	209,945		
DMA B	1,142,153		

Table C.3 Type 'B', Self-Retaining Areas

Self-Retaining Area				**Type 'C' DMAs that are draining to the Self-Retaining Area**		
DMA Name/ ID	Post-project surface type	Area (square feet) [A]	Storm Depth (inches) [B]	DMA Name / ID	[C] from Table C.4 = [C]	Required Retention Depth (inches) [D]

$$[D] = [B] + \frac{[B] \cdot [C]}{[A]}$$

Table C.4 Type 'C', Areas that Drain to Self-Retaining Areas

DMA					Receiving Self-Retaining DMA		
DMA Name/ ID	Area (square feet)	Post-project surface type	Runoff factor	Product		Area (square feet)	Ratio
	[A]		[B]	[C] = [A] x [B]	DMA name /ID	[D]	[C]/[D]

Table C.5 Type 'D', Areas Draining to BMPs

DMA Name or ID	BMP Name or ID
DMA A	Extended Detention Basin A
DMA B	Extended Detention Basin B

Note: More than one drainage management area can drain to a single LID BMP, however, one drainage management area may not drain to more than one BMP.

Section D: Implement LID BMPs

D.1 Infiltration Applicability

Is there an approved downstream 'Highest and Best Use' for stormwater runoff (see discussion in Chapter 2.4.4 of the WQMP Guidance Document for further details)? ☐ Y ☒ N

If yes has been checked, Infiltration BMPs shall not be used for the site. If no, continue working through this section to implement your LID BMPs. It is recommended that you contact your Co-Permittee to verify whether or not your project discharges to an approved downstream 'Highest and Best Use' feature.

Geotechnical Report

A Geotechnical Report or Phase I Environmental Site Assessment may be required by the Copermittee to confirm present and past site characteristics that may affect the use of Infiltration BMPs. In addition, the Co-Permittee, at their discretion, may not require a geotechnical report for small projects as described in Chapter 2 of the WQMP Guidance Document. If a geotechnical report has been prepared, include it in Appendix 3. In addition, if a Phase I Environmental Site Assessment has been prepared, include it in Appendix 4.

Is this project classified as a small project consistent with the requirements of Chapter 2 of the WQMP Guidance Document? ☐ Y ☒ N

Infiltration Feasibility

Table D.1 below is meant to provide a simple means of assessing which DMAs on your site support Infiltration BMPs and is discussed in the WQMP Guidance Document in Chapter 2.4.5. Check the appropriate box for each question and then list affected DMAs as applicable. If additional space is needed, add a row below the corresponding answer.

Table D.1 Infiltration Feasibility

Does the project site…	YES	NO
…have any DMAs with a seasonal high groundwater mark shallower than 10 feet?		X
If Yes, list affected DMAs:		
…have any DMAs located within 100 feet of a water supply well?		X
If Yes, list affected DMAs:		
…have any areas identified by the geotechnical report as posing a public safety risk where infiltration of stormwater could have a negative impact?		X
If Yes, list affected DMAs:		
…have measured in-situ infiltration rates of less than 1.6 inches / hour?	X	
If Yes, list affected DMAs:	B	
…have significant cut and/or fill conditions that would preclude in-situ testing of infiltration rates at the final infiltration surface?	X	
If Yes, list affected DMAs:	A,B	
…geotechnical report identify other site-specific factors that would preclude effective and safe infiltration?		X
Describe here:		

If you answered "Yes" to any of the questions above for any DMA, Infiltration BMPs should not be used for those DMAs and you should proceed to the assessment for Harvest and Use below.

D.2 Harvest and Use Assessment

Please check what applies*:*

☐ Reclaimed water will be used for the non-potable water demands for the project.

☐Downstream water rights may be impacted by Harvest and Use as approved by the Regional Board (verify with the Copermittee).

☐The Design Capture Volume will be addressed using Infiltration Only BMPs. In such a case, Harvest and Use BMPs are still encouraged, but it would not be required if the Design Capture Volume will be infiltrated or evapotranspired.

If any of the above boxes have been checked, Harvest and Use BMPs need not be assessed for the site. If neither of the above criteria applies, follow the steps below to assess the feasibility of irrigation use, toilet use and other non-potable uses (e.g., industrial use).

Irrigation Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for Irrigation Use BMPs on your site:

Step 1: Identify the total area of irrigated landscape on the site, and the type of landscaping used.

Total Area of Irrigated Landscape: 55.8

Type of Landscaping (Conservation Design or Active Turf): Conservation Design

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for irrigation use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: 79.2 Acres

Step 3: Cross reference the Design Storm depth for the project site (see Exhibit A of the WQMP Guidance Document) with the left column of Table 2-3 in Chapter 2 to determine the minimum area of Effective Irrigated Area per Tributary Impervious Area (EIATIA).

Enter your EIATIA factor: 1.85

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum irrigated area that would be required.

Minimum required irrigated area: 146

Step 5: Determine if harvesting stormwater runoff for irrigation use is feasible for the project by comparing the total area of irrigated landscape (Step 1) to the minimum required irrigated area (Step 4).

Minimum required irrigated area (Step 4)	Available Irrigated Landscape (Step 1)
146	55.8

Toilet Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for toilet flushing uses on your site:

Step 1: Identify the projected total number of daily toilet users during the wet season, and account for any periodic shut downs or other lapses in occupancy:

Projected Number of Daily Toilet Users: 1,000

Project Type: Commercial/Industrial

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for toilet use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: 79.2

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-1 in Chapter 2 to determine the minimum number or toilet users per tributary impervious acre (TUTIA).

Enter your TUTIA factor: 219

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum number of toilet users that would be required.

Minimum number of toilet users: 17,345

Step 5: Determine if harvesting stormwater runoff for toilet flushing use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

Minimum required Toilet Users (Step 4)	Projected number of toilet users (Step 1)
17,345	1,000

Other Non-Potable Use Feasibility

Are there other non-potable uses for stormwater runoff on the site (e.g. industrial use)? See Chapter 2 of the Guidance for further information. If yes, describe below. If no, write N/A.

N/A

Step 1: Identify the projected average daily non-potable demand, in gallons per day, during the wet season and accounting for any periodic shut downs or other lapses in occupancy or operation.

Average Daily Demand: N/A

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for the identified non-potable use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: N/A

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-3 in Chapter 2 to determine the minimum demand for non-potable uses per tributary impervious acre.

Enter the factor from Table 2-3: N/A

Step 4: Multiply the unit value obtained from Step 4 by the total of impervious areas from Step 3 to develop the minimum number of gallons per day of non-potable use that would be required.

Minimum required use: N/A

Step 5: Determine if harvesting stormwater runoff for other non-potable use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

Minimum required non-potable use (Step 4)	**Projected average daily use (Step 1)**
N/A	N/A

If Irrigation, Toilet and Other Use feasibility anticipated demands are less than the applicable minimum values, Harvest and Use BMPs are not required and you should proceed to utilize LID Bioretention and Biotreatment, unless a site-specific analysis has been completed that demonstrates technical infeasibility as noted in D.3 below.

D.3 Bioretention and Biotreatment Assessment

Other LID Bioretention and Biotreatment BMPs as described in Chapter 2.4.7 of the WQMP Guidance Document are feasible on nearly all development sites with sufficient advance planning.

Select one of the following:

☒ LID Bioretention/Biotreatment BMPs will be used for some or all DMAs of the project as noted below in Section D.4 (note the requirements of Section 3.4.2 in the WQMP Guidance Document).

☐ A site-specific analysis demonstrating the technical infeasibility of all LID BMPs has been performed and is included in Appendix 5. If you plan to submit an analysis demonstrating the technical infeasibility of LID BMPs, request a pre-submittal meeting with the Copermittee to discuss this option. Proceed to Section E to document your alternative compliance measures.

D.4 Feasibility Assessment Summaries

From the Infiltration, Harvest and Use, Bioretention and Biotreatment Sections above, complete Table D.2 below to summarize which LID BMPs are technically feasible, and which are not, based upon the established hierarchy.

Table D.2 LID Prioritization Summary Matrix

DMA Name/ID	LID BMP Hierarchy				No LID (Alternative Compliance)
	1. Infiltration	2. Harvest and use	3. Bioretention	4. Biotreatment	
DMA A	☐	☐	☐	☒	☐
DMA B	☐	☐	☐	☒	☐
	☐	☐	☐	☐	☐
	☐	☐	☐	☐	☐
	☐	☐	☐	☐	☐
	☐	☐	☐	☐	☐

For those DMAs where LID BMPs are not feasible, provide a brief narrative below summarizing why they are not feasible, include your technical infeasibility criteria in Appendix 5, and proceed to Section E below to document Alternative Compliance measures for those DMAs. Recall that each proposed DMA must pass through the LID BMP hierarchy before alternative compliance measures may be considered.

N/A

D.5 LID BMP Sizing

Each LID BMP must be designed to ensure that the Design Capture Volume will be addressed by the selected BMPs. First**,** calculate the Design Capture Volume for each LID BMP using the V_{BMP} worksheet in Appendix F of the LID BMP Design Handbook. Second**,** design the LID BMP to meet the required V_{BMP} using a method approved by the Copermittee. Utilize the worksheets found in the LID BMP Design Handbook or consult with your Copermittee to assist you in correctly sizing your LID BMPs. Complete Table D.3 below to document the Design Capture Volume and the Proposed Volume for each LID BMP. Provide the completed design procedure sheets for each LID BMP in Appendix 6. You may add additional rows to the table below as needed.

Table D.3 DCV Calculations for LID BMPs

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	DMA Runoff Factor	DMA Areas x Runoff Factor	*Enter BMP Name / Identifier Here*		
	[A]		[B]	[C]	[A] x [C]			
A	*811,000*	*Roofs*	*1*	*0.89*	*723,412*	*Design Storm Depth (in)*	*Design Capture Volume, V_{BMP} (cubic feet)*	*Proposed Volume on Plans (cubic feet)*
A	*317,290*	*Ornamental Landscaping*	*0.1*	*0.11*	*35,047*			
A	*757,798*	*Concrete or Asphalt*	*1*	*0.89*	*675,956*			
	1,886,088 (43.3 Ac)				1,434,415	0.79	94,432	96,790 (3.4' Basin Depth)

DMA Type/ID	DMA Area (square feet)	Post-Project Surface Type	Effective Impervious Fraction, I_f	DMA Runoff Factor	DMA Areas x Runoff Factor	*Enter BMP Name / Identifier Here*		
	[A]		[B]	[C]	[A] x [C]			
B	*1,0127,760*	*Roofs*	*1*	*0.89*	*903,382*	*Design Storm Depth (in)*	*Design Capture Volume, V_{BMP} (cubic feet)*	*Proposed Volume on Plans (cubic feet)*
B	*760,661*	*Ornamental Landscaping*	*0.1*	*0.11*	*84,021*			
B	*870,554*	*Concrete or Asphalt*	*1*	*0.89*	*776,534*			
	2,643,975 (60.7 Ac)				1,763,937	0.79	116,126	123,820 (1.9' Basin Depth)

[B], [C] is obtained as described in Section 2.3.1 of the WQMP Guidance Document

[E] is obtained from Exhibit A in the WQMP Guidance Document

[G] is obtained from a design procedure sheet, such as in LID BMP Design Handbook and placed in Appendix 6

Section E: Alternative Compliance (LID Waiver Program)

LID BMPs are expected to be feasible on virtually all projects. Where LID BMPs have been demonstrated to be infeasible as documented in Section D, other Treatment Control BMPs must be used (subject to LID waiver approval by the Copermittee). Check one of the following Boxes:

☐ LID Principles and LID BMPs have been incorporated into the site design to fully address all Drainage Management Areas. No alternative compliance measures are required for this project and thus this Section is not required to be completed.

- *Or* -

☐ The following Drainage Management Areas are unable to be addressed using LID BMPs. A site-specific analysis demonstrating technical infeasibility of LID BMPs has been approved by the Co-Permittee and included in Appendix 5. Additionally, no downstream regional and/or sub-regional LID BMPs exist or are available for use by the project. The following alternative compliance measures on the following pages are being implemented to ensure that any pollutant loads expected to be discharged by not incorporating LID BMPs, are fully mitigated.

All Drainage Management areas are addressed by LID BMPs, thus Section E is not completed.

E.1 Identify Pollutants of Concern

Utilizing Table A.1 from Section A above which noted your project's receiving waters and their associated EPA approved 303(d) listed impairments, cross reference this information with that of your selected Priority Development Project Category in Table E.1 below. If the identified General Pollutant Categories are the same as those listed for your receiving waters, then these will be your Pollutants of Concern and the appropriate box or boxes will be checked on the last row. The purpose of this is to document compliance and to help you appropriately plan for mitigating your Pollutants of Concern in lieu of implementing LID BMPs.

Table E.1 Potential Pollutants by Land Use Type

Priority Development Project Categories and/or Project Features (check those that apply)	General Pollutant Categories							
	Bacterial Indicators	Metals	Nutrients	Pesticides	Toxic Organic Compounds	Sediments	Trash & Debris	Oil & Grease
☐ Detached Residential Development	P	N	P	P	N	P	P	P
☐ Attached Residential Development	P	N	P	P	N	P	P	P[(2)]
☐ Commercial/Industrial Development	P[(3)]	P	P[(1)]	P[(1)]	P[(5)]	P[(1)]	P	P
☐ Automotive Repair Shops	N	P	N	N	P[(4, 5)]	N	P	P
☐ Restaurants (>5,000 ft^2)	P	N	N	N	N	N	P	P
☐ Hillside Development (>5,000 ft^2)	P	N	P	P	N	P	P	P
☐ Parking Lots (>5,000 ft^2)	P[(6)]	P	P[(1)]	P[(1)]	P[(4)]	P[(1)]	P	P
☐ Retail Gasoline Outlets	N	P	N	N	P	N	P	P
Project Priority Pollutant(s) of Concern	☐	☐	☐	☐	☐	☐	☐	☐

P = Potential

N = Not Potential

(1) A potential Pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected

(2) A potential Pollutant if the project includes uncovered parking areas; otherwise not expected

(3) A potential Pollutant is land use involving animal waste

(4) Specifically petroleum hydrocarbons

(5) Specifically solvents

(6) Bacterial indicators are routinely detected in pavement runoff

E.2 Stormwater Credits

Projects that cannot implement LID BMPs but nevertheless implement smart growth principles are potentially eligible for Stormwater Credits. Utilize Table 3-8 within the WQMP Guidance Document to identify your Project Category and its associated Water Quality Credit. If not applicable, write N/A.

Table E.2 Water Quality Credits

Qualifying Project Categories	Credit Percentage[2]
Total Credit Percentage[1]	

[1] *Cannot Exceed 50%*
[2] *Obtain corresponding data from Table 3-8 in the WQMP Guidance Document*

E.3 Sizing Criteria

After you appropriately considered Stormwater Credits for your project, utilize Table E.3 below to appropriately size them to the DCV, or Design Flow Rate, as applicable. Please reference Chapter 3.5.2 of the WQMP Guidance Document for further information.

Table E.3 Treatment Control BMP Sizing

DMA Type/ID	**DMA Area (square feet)**	**Post-Project Surface Type**	**Effective Impervious Fraction, I_f**	**DMA Runoff Factor**	**DMA Area x Runoff Factor**		***Enter BMP Name / Identifier Here***		
	[A]		[B]	[C]	[A] x [C]				
						Design Storm Depth (in)	*Minimum Design Capture Volume or Design Flow Rate (cubic feet or cfs)*	*Total Storm Water Credit % Reduction*	*Proposed Volume or Flow on Plans (cubic feet or cfs)*
	A_T = Σ[A]				Σ= [D]	[E]	$[F] = \frac{[D]x[E]}{[G]}$	[F] X (1-[H])	[I]

[B], [C] is obtained as described in Section 2.3.1 from the WQMP Guidance Document
[E] is obtained from Exhibit A in the WQMP Guidance Document
[G] is for Flow-Based Treatment Control BMPs [G] = 43,560, for Volume-Based Control Treatment BMPs, [G] = 12
[H] is from the Total Credit Percentage as Calculated from Table E.2 above
[I] as obtained from a design procedure sheet from the BMP manufacturer and should be included in Appendix 6

E.4 Treatment Control BMP Selection

Treatment Control BMPs typically provide proprietary treatment mechanisms to treat potential pollutants in runoff, but do not sustain significant biological processes. Treatment Control BMPs must have a removal efficiency of a medium or high effectiveness as quantified below:

- **High**: equal to or greater than 80% removal efficiency
- **Medium**: between 40% and 80% removal efficiency

Such removal efficiency documentation (e.g., studies, reports, etc.) as further discussed in Chapter 3.5.2 of the WQMP Guidance Document, must be included in Appendix 6. In addition, ensure that proposed Treatment Control BMPs are properly identified on the WQMP Site Plan in Appendix 1.

Table E.4 Treatment Control BMP Selection

Selected Treatment Control BMP Name or ID[1]	Priority Pollutant(s) of Concern to Mitigate[2]	Removal Efficiency Percentage[3]

[1] *Treatment Control BMPs must not be constructed within Receiving Waters. In addition, a proposed Treatment Control BMP may be listed more than once if they possess more than one qualifying pollutant removal efficiency.*
[2] *Cross Reference Table E.1 above to populate this column.*
[3] *As documented in a Co-Permittee Approved Study and provided in Appendix 6.*

Section F: Hydromodification

F.1 Hydrologic Conditions of Concern (HCOC) Analysis

Once you have determined that the LID design is adequate to address water quality requirements, you will need to assess if the proposed LID Design may still create a HCOC. Review Chapters 2 and 3 (including Figure 3-7) of the WQMP Guidance Document to determine if your project must mitigate for Hydromodification impacts. If your project meets one of the following criteria which will be indicated by the check boxes below, you do not need to address Hydromodification at this time. However, if the project does not qualify for Exemptions 1, 2 or 3, then additional measures must be added to the design to comply with HCOC criteria. This is discussed in further detail below in Section F.2.

HCOC EXEMPTION 1: The Priority Development Project disturbs less than one acre. The Copermittee has the discretion to require a Project-Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The disturbed area calculation should include all disturbances associated with larger common plans of development.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply.

HCOC EXEMPTION 2: The volume and time of concentration[1] of storm water runoff for the post-development condition is not significantly different from the pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant) using one of the following methods to calculate:

- Riverside County Hydrology Manual
- Technical Release 55 (TR-55): Urban Hydrology for Small Watersheds (NRCS 1986), or derivatives thereof, such as the Santa Barbara Urban Hydrograph Method
- Other methods acceptable to the Co-Permittee

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, report results in Table F.1 below and provide your substantiated hydrologic analysis in Appendix 7.

Table F.1 Hydrologic Conditions of Concern Summary

	2 year – 24 hour		
	Pre-condition	**Post-condition**	**% Difference**
Time of Concentration	N/A	N/A	N/A
Volume (Cubic Feet)	N/A	N/A	N/A

[1] Time of concentration is defined as the time after the beginning of the rainfall when all portions of the drainage basin are contributing to flow at the outlet.

HCOC EXEMPTION 3: All downstream conveyance channels to an adequate sump (for example, Prado Dam, Lake Elsinore, Canyon Lake, Santa Ana River, or other lake, reservoir or naturally erosion resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will be adversely affected; or are not identified on the Co-Permittees Hydromodification Sensitivity Maps.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply and note below which adequate sump applies to this HCOC qualifier:

N/A

F.2 HCOC Mitigation

If none of the above HCOC Exemption Criteria are applicable, HCOC criteria is considered mitigated if they meet one of the following conditions:

a. Additional LID BMPS are implemented onsite or offsite to mitigate potential erosion or habitat impacts as a result of HCOCs. This can be conducted by an evaluation of site-specific conditions utilizing accepted professional methodologies published by entities such as the California Stormwater Quality Association (CASQA), the Southern California Coastal Water Research Project (SCCRWP), or other Co-Permittee approved methodologies for site-specific HCOC analysis.

b. The project is developed consistent with an approved Watershed Action Plan that addresses HCOC in Receiving Waters.

c. Mimicking the pre-development hydrograph with the post-development hydrograph, for a 2-year return frequency storm. Generally, the hydrologic conditions of concern are not significant, if the post-development hydrograph is no more than 10% greater than pre-development hydrograph. In cases where excess volume cannot be infiltrated or captured and reused, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow.

Be sure to include all pertinent documentation used in your analysis of the items a, b or c in Appendix 7.

Section G: Source Control BMPs

Source control BMPs include permanent, structural features that may be required in your project plans — such as roofs over and berms around trash and recycling areas — and Operational BMPs, such as regular sweeping and "housekeeping", that must be implemented by the site's occupant or user. The MEP standard typically requires both types of BMPs. In general, Operational BMPs cannot be substituted for a feasible and effective permanent BMP. Using the Pollutant Sources/Source Control Checklist in Appendix 8, review the following procedure to specify Source Control BMPs for your site:

1. ***Identify Pollutant Sources*:** Review Column 1 in the Pollutant Sources/Source Control Checklist. Check off the potential sources of Pollutants that apply to your site.

2. ***Note Locations on Project-Specific WQMP Exhibit*:** Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist. Show the location of each Pollutant source and each permanent Source Control BMP in your Project-Specific WQMP Exhibit located in Appendix 1.

3. ***Prepare a Table and Narrative*:** Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist. In the left column of Table G.1 below, list each potential source of runoff Pollutants on your site (from those that you checked in the Pollutant Sources/Source Control Checklist). In the middle column, list the corresponding permanent, Structural Source Control BMPs (from Columns 2 and 3 of the Pollutant Sources/Source Control Checklist) used to prevent Pollutants from entering runoff. **Add additional narrative** in this column that explains any special features, materials or methods of construction that will be used to implement these permanent, Structural Source Control BMPs.

4. ***Identify Operational Source Control BMPs:*** To complete your table, refer once again to the Pollutant Sources/Source Control Checklist. List in the right column of your table the Operational BMPs that should be implemented as long as the anticipated activities continue at the site. Copermittee stormwater ordinances require that applicable Source Control BMPs be implemented; the same BMPs may also be required as a condition of a use permit or other revocable Discretionary Approval for use of the site.

Table G.1 Permanent and Operational Source Control Measures

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs
A. *On-site storm drain catch basins and grated inlets.*	*On-site storm drain signage will utilize language, "No Dumping Drains to River", or equally approved text that is consistent with the County of Riverside's requirements. Landscape area drains surrounded by vegetation will not be signed. Catch Basin Markers may be available from the Riverside County Flood Control and Water District Conservation District, call 951-955-1200 to verify.*	*Maintain and periodically repaint or replace inlet markings.* *Provide stormwater pollution prevention information to new site owners, lessees, or operators.* *See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in Appendix 10 (CASQA Stormwater Quality Handbook at www.cabmphandbooks.com*

		Include the following in lessee agreements: "Tenants shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains" *Maintenance should include removal of trash, debris, & sediment and the repair of any deficiencies or damage that may impact water quality.*
B. Interior floor drains and elevator shaft sump	*The interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer*	*Inspect and maintain drains to prevent blockages and overflow.*
C. Landscape/Outdoor Pesticide Use	*The final landscape shall be designed to accomplish all of the following:* *Preserve existing native trees, shrubs and ground cover to the maximum extent possible.* *Design landscape to minimize irrigation and runoff, to promote surface infiltration where appropriate and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution.* *Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions.* *Consider using pest-resistant plants, especially adjacent to hardscape.* *To ensure successful establishments, select plants appropriate to site, soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency and plant interactions.* *Pesticide usage should be at a necessary minimum and be consistent with the instructions contained on product labels and with the regulations administered by the State Department of Pesticide Regulation.* *Pesticides should be used at an*	*Maintain landscaping using minimum or no pesticides* *See applicable operational BMPs in "What you should know for…. Landscape and Gardening" at http://rcflood.org/stormwater and Appendix 10.* *Provide IPM information to new owners, lessees and operators.* *Landscape maintenance should include mowing, weeding, trimming, removal of trash & debris, repair of erosion, re-vegetation, and removal of cut & dead vegetation.* *Irrigation maintenance should include the repair of leaky or broken sprinkler heads, the maintaining of timing apparatus accuracy, and the maintaining of shut off valves in good working order.*

	absolute minimum or not at all in the retention/infiltration basin. If used, it should not be applied in close proximity to the rainy season.	
D. Refuse Trash Storage areas	*Trash container storage areas shall be paved with an impervious surface, designed not to allow run-on from adjoining areas, designed to divert drainage from adjoining roofs and pavements from the surrounding area, and screened or walled to prevent off-site transport of trash.* *Trash dumpsters (containers) shall be leak proof and have attached covers or lids.* *Trash enclosures shall be roofed per City standards.* *Trash compactors shall be roofed and set on a concrete pad per City standards. The pad shall be a minimum of one foot larger all around than the trash compactor and sloped to drain to a sanitary sewer line. Connection of trash area drains to the MS4 is prohibited.* *See CASQA SD-32 BMP Fact Sheets in Appendix 10 for additional information.* *Signs shall be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar.*	*Adequate number of receptacles shall be provided. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, in Appendix 10, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbook at www.cabmphandbooks.com*
E. Loading Docks	*Loading docks will not be covered and are 4 feet above finished pavement surface.*	*Move loaded and unloaded items indoors as soon as possible.* *Inspect for accumulated trash and debris. Implement good housekeeping procedures on a regular basis. Sweep areas clean instead of using wash water. Loading docks will be kept in a clean and orderly condition, through a regular program of sweeping and litter control, and immediate clean up of any spills or broken containers. Property owner will ensure that loading docks will be swept as needed. Cleanup procedures will not include the use of wash-down water. Property owner will be responsible for implementation of loading dock*

		housekeeping procedures *See the Fact Sheet SC-30, in Appendix 10, "Outdoor Loading and Unloading" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com*
F. Fire Sprinkler Test Water	*Provide a means to drain fire sprinkler test water to the sanitary sewer.*	*See the note in the Fact Sheet SC-41, in Appendix 10, "Building and Grounds Maintenance", in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com*
G. Miscellaneous Drain or Wash Water or Other Sources *Boiler drain lines* *Condensate drain lines* *Rooftop equipment* *Drainage sumps* *Roofing, gutters and trim* *Other sources*	*Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system* *Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur.* *Condensate drain lines may not discharge to the storm drain system.* *Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment.* *Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water.* *Avoid roofing, gutters and trim made of copper of other unprotected metals that may leach into runoff.* *Include controls for other sources as specified by local reviewer.*	
H. Plazas, sidewalks, and parking lots		*Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.*

Section H: Construction Plan Checklist

Populate Table H.1 below to assist the plan checker in an expeditious review of your project. The first two columns will contain information that was prepared in previous steps, while the last column will be populated with the corresponding plan sheets. This table is to be completed with the submittal of your final Project-Specific WQMP.

Table H.1 Construction Plan Cross-reference

BMP No. or ID	BMP Identifier and Description	Corresponding Plan Sheet(s)

Note that the updated table — or Construction Plan WQMP Checklist — is **only a reference tool** to facilitate an easy comparison of the construction plans to your Project-Specific WQMP. Co-Permittee staff can advise you regarding the process required to propose changes to the approved Project-Specific WQMP.

Section I: Operation, Maintenance and Funding

The Copermittee will periodically verify that Stormwater BMPs on your site are maintained and continue to operate as designed. To make this possible, your Copermittee will require that you include in Appendix 9 of this Project-Specific WQMP:

1. A means to finance and implement facility maintenance in perpetuity, including replacement cost.
2. Acceptance of responsibility for maintenance from the time the BMPs are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the Stormwater BMPs you have selected.
4. Figures delineating and designating pervious and impervious areas, location, and type of Stormwater BMP, and tables of pervious and impervious areas served by each facility. Geo-locating the BMPs using a coordinate system of latitude and longitude is recommended to help facilitate a future statewide database system.
5. A separate list and location of self-retaining areas or areas addressed by LID Principles that do not require specialized O&M or inspections but will require typical landscape maintenance as noted in Chapter 5, pages 85-86, in the WQMP Guidance. Include a brief description of typical landscape maintenance for these areas.

Your local Co-Permittee will also require that you prepare and submit a detailed Stormwater BMP Operation and Maintenance Plan that sets forth a maintenance schedule for each of the Stormwater BMPs built on your site. An agreement assigning responsibility for maintenance and providing for inspections and certification may also be required.

Details of these requirements and instructions for preparing a Stormwater BMP Operation and Maintenance Plan are in Chapter 5 of the WQMP Guidance Document.

Maintenance Mechanism: ***The project owner will maintain all stormwater BMPs. See Appendix 9.***

Will the proposed BMPs be maintained by a Home Owners' Association (HOA) or Property Owners Association (POA)?

☐ Y ☒ N

Include your Operation and Maintenance Plan and Maintenance Mechanism in Appendix 9. Additionally, include all pertinent forms of educational materials for those personnel that will be maintaining the proposed BMPs within this Project-Specific WQMP in Appendix 10.

To be completed at time of the Final WQMP Submittal.

Project # 105-02 **October 23, 2012**

Executive Summary

- Based on our review of previous subsurface investigations, the geologic and geotechnical engineering data and analyses indicate the potential for infiltration within the site is feasible.

- The results of our field infiltration study performed using the double ring infiltrometer and well permeameter methods indicate the infiltration rate of the site soils at the tested locations ranges from 1.2 in./hr. to 3.0 in./hr.

- As a reasonably conservative approach, the minimum measured field infiltration rate of 1.2 in./hr. may be considered in the initial feasibility screening stage. A factor of safety not less than 2.0 should be used to compute the design infiltration rate.

1.0 Introduction

1.1 Site Description

The site has an irregular rectangular shape consisting of 395 acres and is located in the San Timoteo Badlands near the western portion of the San Gorgonio Pass and the southern flank of the San Bernardino Mountains (Figure 1). It is located just east of Interstate 10 on the north side of Cherry Valley Boulevard. The site is accessible via unpaved, graded roads (Figure 2).

The northern half of the site is characterized by badlands topography with narrow ridgelines, steep flanks and narrow valleys trending northeast-southwest.

The southern half is relatively flat with subdued ridgelines in the north trending west-southwest merging into a flat alluvial plain trending east-west.

Vegetation consists predominately of native grasses with sage scrub and occasion scrub oak in the north. The southern portion of the site appears to have been cultivated for agriculture in the past. An intermittent stream meanders along the southern perimeter, which drains to the west.

A water line and fiber optic cable traverse the northern portion of the site in an east-west trend with several utility vaults. Some cuts, fills and roadways are associated with this easement.

1.2 Purpose and Scope of Investigation

The purpose of this report is to summarize technical opportunities and constraints and limitations for infiltration type best management practices within the proposed I-10 Gateway Job Center development plan. Infiltration is the highest priority for water quality treatment (2011 Model WQMP; Technical Guidance Document), based on the most recent water quality requirements for storm water management.

The water quality regulation assume 100% infiltration of the water quality design storm event (85th percentile 24-hour storm event) is feasible on-site within the development footprint, unless site specific analysis indicates full infiltration or partial infiltration is not feasible. Sub-surface conditions such as depth of compacted fill, soil types, infiltration rates, depth to groundwater, constructability and maintenance all

factor into the ability to safely infiltrate storm water into the ground within the proposed development areas.

1.3 Summary of Previous Investigations

The majority of previous investigations by other were primarily directed towards determining the location and recommended setback zones for the north and south branches of the Cherry Valley Fault Zone.

CHJ, Inc. performed a site specific subsurface investigation of faulting with a report dated August 3, 2005. They utilized aerial photo lineament analyses, geologic field mapping, excavation of 5 trenches totaling 2,215 lineal feet from 15 to 21 feet deep and 4 slope cuts totaling 2,600 lineal feet.

Concurrent with their fault investigation, CHJ, Inc. performed an engineering geologic investigation with a report dated August 15, 2005. They excavated 35 hollow stem borings and placed 33 cone penetrometer tests (CPT) on the site.

Neblett & Associates, Inc. performed a thorough fault investigation on the site with a report dated September 22, 2008. It should be noted that the undersigned was employed at Neblett & Associates, Inc. as Chief Geologist and directly supervised the fault investigation by them. They utilized aerial photo lineament analyses, reconnaissance mapping, the excavation of six fault trenches varying in length from 120 feet to 970 feet and 12 to 15 feet deep, and structure contouring.

Neblett & Associates, Inc. also provided a grading plan review report on the site for Parcel Map No. 36093, dated April 3, 2009. They excavated 4 hollowstem borings from 58 to 71 feet in depth.

2.0 Geomorphic Setting

The subject site is located at the western end of a relatively broad east-west trending trough known as the San Gorgonio Pass between the San Jacinto Mountains on the south and the San Bernardino Mountains to the north. This pronounced morphologic feature is predominately due to the tectonics of the area consisting of complex faulting, folding and uplift. The erosional and depositional processes have played a minor role in the geomorphology of the area when compared to the tectonic processes.

The San Gorgonio Pass is the lowest topographic break in southern California through the mountains to the inland deserts, separating Mt. San Gorgonio (elevation 11,502 ft.) and Mt. San Jacinto (elevation 10, 786 ft.), the two highest mountains in southern California. The crest of the pass is the headwaters of three major drainage basins: the interior-draining Whitewater River-Salton Trough to the east; the generally interior-draining San Jacinto basin to the south; and the Santa Ana basin to the west.

The flanks and the floor of the trough contain dissected old alluvial fan deposits, old alluvial gravel and sand sediments, and recent alluvial gravel and sand of stream channels that have formed relatively flat pediments sloping gently to the trough's axis.

The subject site is located at the western end of this trough on the north flank. The site and its vicinity are within the San Timoteo Badlands characterized by northeast to southwest trending narrow ridges and valleys that provides the source for the older alluvial fan deposits and younger alluvial sands and gravels to the south.

Within the subject site, the typical northeast-southwest trending ridges and valley drainages changes direction at the Cherry Valley Fault Zone (north and south branch) to east-northeast to west-southwest trending ridges and valley drainages. The modern drainage of the recent alluvial plain in the south again changes direction from eat-northeast to west-southwest immediately south of the Cherry Valley Fault Zone to east-west in the southern portion of the site.

These changes in drainage flow direction suggest that they are predominately controlled by fault movements and uplift.

3.0 Geologic Setting

3.1 Regional Geologic Setting

The site is located near the boundary of the northeastern Peninsular Ranges and the southeastern Transverse Ranges consisting of the San Jacinto Mountains and the San Bernardino Mountains respectively. The northeastern Peninsular Ranges are part of the Southern California Batholith, which is comprised of Paleozoic to Mesozoic age igneous, metasedimentary and metavolcanic rock types overlain unconformably by non-marine clastic sediments of late tertiary and Quaternary age.

The northwesterly trend of elongate ranges and valley of this portion of the province are terminated abruptly by the general east-west grain of the Transverse Ranges.

The southeastern portion of the Transverse Range contains the San Bernardino Mountains, which have been uplifted along the San Andreas and Banning Faults on the south and along several steeply dipping reverse faults on the north.

The subject site is situated at the juncture of the Transverse Range and the Peninsular Range in the western end of the San Gorgonio Pass area. In this area, the Mojave Desert segment and the Coachella Valley segment of the San Andreas Fault Zone step left from each other and this fault zone becomes a complex combination of strike-slip faults and thrust and tear faults that include the Banning Fault and the San Gorgonio Valley Fault Zone. The Cherry Valley Fault Zone of the subject area is considered a western extension of the San Gorgonio Pass Fault Zone (Matti and Morton, 1993).

The site is also located in the "Badlands" area of relatively low hills southeast of Calimesa characterized by narrow ridge line and steep-walled flanks comprised predominately of the San Timoteo Formation within the Peninsular Ranges province (Figure 3). This Plio-Pleistocene age sedimentary unit consists of fluviatile sandstones and gravels with minor lacustrine siltstones. The floor and edges of the San Gorgonio Pass trough consist of dissected old alluvial terrace deposits and younger alluvial sand and gravels. These units are present in the southern portion of the subject site.

The tectonic setting of southern California is dominated by the northwest-trending San Andreas Fault and its sister faults, which have a right-lateral movement pattern between the North American Plate and the Pacific Plate. Local compression and/or extension as a result of the translational motion along this plate boundary has formed left-lateral, reverse, normal and blind thrust faults.

The main strand of the San Andreas Fault in southern California has been divided into two segments – the Mojave Desert segment separating the San Bernardino Mountains from the San Gabriel Mountains, and the Coachella Valley segment separating the Peninsular Ranges from the San Bernardino Mountains (Matti and Morton, 1993). The main strand deflects west in the San Gorgonio Pass area where the fault zone becomes more complex and does not have a clean, currently active, through-going fault break, but is a combination of older strike-slip faults and newer thrust and tear faults (Treiman, 1994). The Banning and San Gorgonio Pass faults, including the Cherry Valley Fault Zone, are part of this complex fault system in the San Gorgonio Pass area.

The Coachella Valley segment splits into two principal strands as it approaches the San Bernardino Mountains. The most northern has been designated as the North Branch of the San Andreas Fault by Dibblee (1975), the Mission Creek Fault by Allen (1957) and the Coachella Valley Segment of the San Andreas Fault by Matti, et al. (1992). This strand merges to the northwest into the Mill Creek and Mission Creek faults.

The San Gorgonio Pass Fault Zone is characterized by discontinuous reverse and thrust faults and associated tear faults (Treiman, 1994) generally located at the base of the San Bernardino Mounts. The San Gorgonio Pass Fault Zone includes, from the west to east, the Cherry Valley Fault Zone, a fault along the toe of the Banning Bench, and a northeast-trending segment crossing the lower part of the Millard Canyon fan.

The Cherry Valley Fault Zone in the subject site's vicinity has been mapped by Matti and Morton (1974-1991) as two traces. This fault zone has been mapped by various workers (Figure 3), predominately as two sub-parallel faults which merge to the east to form one trace near the eastern property boundary and then veers northeast, displacing remnants of a mid-to-late-Pleistocene fan (Treiman, 1994).

East of the subject site, the Cherry Valley fault becomes the San Gorgonio Pass Fault Zone and is characterized as a sinuous trace forming several discontinuous scarps on the older fan mid-Pleistocene fan surfaces (Matti and Morton, 1993). Farther east, the fault steps southward from the range, forming the Highland Springs scarp and the toe of the Banning Bench. Matti, et al. (1993), infer northwest-trending, right-lateral tear faults in this area. This fault zone continues northeast as a thrust fault where it eventually merges with the Banning Fault near Gorgonio Canyon.

The Banning Fault is considered an ancestral trace of the San Andreas Fault (Allen, 1957; Matti, et al., 1992) which has been inferred from the Indio Hills to the San Jacinto Fault. During late Cenozoic time the Banning Fault was principally a right-lateral fault, but it has since responded mainly to compressional tectonics in Gorgonio Pass and continuing as a strike-slip fault only to the east (Matti and Morton, 1993).

This fault is located approximately ¼ mile north of the subject site where it consists of a prominent high-angle trace, which separates Pleistocene San Timoteo Formation on the south from granitic rock to the north (Figure 3). Displacement in this area is indicated as a strike-slip by Matti, et al. (1992).

The San Jacinto Fault is located approximately 6 miles southwest of the site and consists of a system of northwest-trending, right-lateral, strike-slip faults. This fault reverses rocks of Peninsular Ranges type and the alleviated San Bernardino Valley before entering the southeastern San Gabriel Mountains. There the fault splays into several sub-parallel strands that traverse rocks of Peninsular Ranges type and San Gabriel Mountains type (Matti and Morton, 1993).

The San Jacinto Fault is the closest known active fault to the site and is considered the most influential with respect to ground shaping and rupture. More large historic earthquakes have occurred on the San Jacinto Fault than any other fault in southern California (Working Group on California Earthquake Probabilities, 1988).

3.2 Site Geologic Conditions

The main geologic units within the site include the Plio-Pleistocene San Timoteo formation in the northeast, and in the southwest old alluvium of an old dissected alluvial fan, with young alluvium along the valley floors. Structurally, the site is dominated by two splays of the Cherry Valley Fault, the North Branch and the South Branch, which transect the site in a northwest to southeast trend (Figure 6). The South Branch generally places the San Timoteo Formation in fault contact with the older alluvium, except in the southeast, where it juxtaposes older alluvial units against one another.

Colluvium is the loose heterogeneous and incoherent mass of soil material and rock fragments deposited by sheetwash or slow continuous downslope creep collecting at the base of gentle slopes and hillslides. Colluvium mantles the slope of the site, but is generally less than 2 feet in thickness.

Undocumented artificial fill is present as backfill for the fault trenches of former investigations, as well as this investigation. Artificial fill is also present with and in the vicinity of the San Gorgonio Pass Water Agency Pipeline easement that transgresses the northern portion of the site. Some of the fault trenches indicate that past agricultural activities and trenching have spilled fill along the edges of the flat-topped ridges in the southern half of the site.

The geologic units mapped at the site are discussed below, in order from youngest to oldest:

Undocumented Fill (afu):

Where observed, this unit consists of a heterogeneous mixture of pebbly sand, silty sand, sandy silt and coarse sand with cobbles and an occasional boulder. In addition to the minor undocumented fills within the fault trenches, spill fills associated with the former investigator's slope cuts are evident downslope. Historic aerial photo analyses and trenching have revealed that an east-west trending ridge located near the eastern property boundary has been cut and "flat-topped" for agricultural purposes.

Younger Alluvium (Qya):

Younger alluvial units outcrop in the active drainages, which generally trend southerly to southwesterly onsite. These younger alluvial materials consisted of silty sands and lesser gravelly sands. Local outcrops within active drainages reveal a highly variable lithology for this unit, which is consistent with the deposition of finer materials during relatively quiescent periods and very coarse materials during periodic storm events.

Older Alluvium (Qoa):

Older alluvial units onsite consist of reddish brown clayey sands and yellowish brown silty sands. Both units have frequent gravel and gravelly sand lenses. The reddish brown clayey sands are highly oxidized and re-mineralized, suggesting a significant difference in age. These units are usually massive to poorly-bedded with localized well-bedded gravels. Where bedded, the units displayed horizontal or near horizontal bedding, except where proximal to faulting, where dips of up to 45 degrees were observed.

San Timoteo Formation (Qtst):

The San Timoteo Formation is located primarily northeast of the South Branch of the Cherry Valley Fault and consists predominately of cobble-boulder conglomerate with minor inter-bedded fine to medium sandstones. The conglomerate matrix is generally moderately to well-cemented and the inter-bedded sandstones are relatively thin compared to the thick massive conglomerates. Clasts are moderately weathered to decomposed and consist of granodiorite, greenstone, quartzite and monzogranite from the adjacent Transverse Ranges. The unit is generally matrix supported with localized clast supported lenses and is massive to poorly-bedded.

Structurally, beds dip at shallow angles to the southwest except near the North Branch of the Cherry Valley Fault and other faults in the northeast portion of the site, where beds dip nearly vertical.

These fluviatile sediments were deposited during the Pliocene and Pleistocene time when the depositional basin was subsiding, uplift of the San Bernardino and San Jacinto Mountains was occurring and movements within the San Andreas and San Jacinto fault systems were taking place (Morton & Matti, 1993).

Two main faults, the north and south branches of the Cherry Valley Fault Zone (CVFZ) have been mapped onsite. Though these two main breaks help define the zone, lineaments and geomorphic evidence suggest a zone of faulting and deformation associated with the CVFZ that may be as wide as 500-700 feet.

North Branch CVFZ:

The north branch is characterized by steeply dipping (near vertical) faulting that is located roughly 200-300 feet north-northeast of and roughly parallel to, the South Branch. The fault generally juxtaposes massive conglomeratic sandstone units within the San Timoteo Formation making relative offset difficult to determine. This fault was not previously trenched due to its location, over 200 feet north of the conceptual development footprint.

South Branch CVFZ:

This fault has been exposed in CHJ trenches and road cuts and in Neblett trenches and in a road cut. It is characterized by a northwest to east-west trending, north-dipping reverse fault. Dips are low to moderate angle (10-45 degrees). Drag folding along the main rupture observed and logged b both CHJ and N&A indicate reverse/thrust kinematics. Relative offsets were not measurable in exposures and trenches, but are significant as the fault juxtaposes older San Timoteo (Plio-Pleistocene) over relatively younger alluvial units. Significant changes in stratigraphy, topography, geomorphology and streamflow direction are present along the entire mapped trace of this fault. This fault was the central focus of N&A's report, due to its potential effect on the conceptual development footprint.

This firm concurs with N&A results of their September 22, 2008 report and their structural setback zone located 50 feet south of, and 100 feet to the north of, the South Branch.

4.0 Proposed Infiltration Basin Facilities

The basins proposed for infiltration are located along the site's southern perimeter subjacent to Cherry Valley Boulevard as shown on Figure 6. There are three basins, one in the southeast corner of the site and two inter-connected by storm drain pipes along the southern boundary, which flow westerly. The two basins subjacent to Cherry Valley Blvd. consist of water quality swales and low flow mitigation areas inter-connected by storm drain pipes.

5.0 Investigative Techniques

5.1 Hollowstem Borings

Numerous hollowstem borings were excavated by previous consultants to determine the properties of the underlying soils. Depths ranged from 25 ft. to 60 ft. and samples were collected at select depths for laboratory analyses. Pertinent borings have been plotted on Figure 6 in the vicinity of the infiltration basins.

5.2 Cone Penetrometer Tests (CPT's)

Additionally, several cone penetration soundings (CPT) were performed by others within the site to supplement the borings, as well as to confirm the data obtained from the borings. Pertinent CPT's have been plotted on Figure 6 in the vicinity of the infiltration basins.

5.3 Double Ring Infiltrometer Tests

Four double ring infiltrometer tests were performed at the locations shown on Figure 6 designated as IP-1 through IP-4. The tests were performed in accordance with the 2011 Model WQMP Technical Guidance Document and ASTM D3385 .

Since the tests are required to be performed 2 feet below the proposed elevation of the floor of the basin (infiltration system) and the floor of the basins generally are 25 ft.± below existing grade, excavations were required.

A Hitachi 555 excavator was utilized to excavate the test site. The slopes were benched mid-height for safety purposed. The logs of the test site are presented in Appendix II.

The double ring infiltrometer consists of a 12-inch inner ring and a 24-inch outer ring. Utilizing the constant head method, water is consistently added to both the outer and inner rings to maintain a constant level throughout the testing. The volume of water needed to maintain the fixed level of the inner ring is measured. A graduated Mariotte tube with flow control system was used to measure the volume of water infiltrated during each time interval. Several trials were performed until the steady state infiltration is observed (i.e., percent change in measured infiltration rate between two successive trials is less than 10 percent). After each trial, the water level was readjusted to the initial level.

The volume of liquid used during each measured time interval is converted into an incremental infiltration velocity (infiltration rate) using the following equation:

$I_t = V/(A*t)$ *where:*

I_t = tested infiltration rate, in./hr.

V = volume of water used during time interval to maintain constant head in the inner ring, $in.^3$

A = area of inner ring, $in.^2$

t = time interval, hr.

5.4 Well Permeameter Test

We excavated an 8-inch diameter boring to a depth of 46 ft. at the location shown on Figure 6 within the proposed infiltration basin. The depth was in accordance with the test being performed 2 ft. below the bottom of the basin floor (elevation 2464).

In order to prevent potential disturbance due to caving during the testing, a 2" diameter PVC was inserted into the hole with the bottom 20 ft. screened with 0.20" screen surrounded by #3 gravel/sand mixture to facilitate the water move quickly towards the boundaries of the drilled hole. The top 30 ft. was solid 2" PVC pipe.

Initially the hole was filled with water approximately about 20 feet above the bottom (to the full height of screened pipe) and waited until the entire water in the hole percolated. Then several trials were made at initial water height at 10 feet above the bottom of the hole to correspond to the design water level of the infiltration basin at approximately 10 feet above the basin bottom elevation. Our observation indicated that two consecutive measurements show that more than 6 inches of water seeps away in less than 25 minutes. Therefore, measurements were taken every 10 minutes. Several trials were performed until a slower and steady state of percolation is observed. After each trial, water level in the hole was readjusted to an elevation 10 feet above the bottom of the hole. A water meter with a sensor was utilized to measure the water depth during the test.

The test performed is in general conformance with The Well Permeameter Method of the United States Bureau of Reclamation (USBR 7300-89). This test measures the rate at which water flows into the soil under constant-head flow conditions and is used to determine field-saturated hydraulic conductivity. The rate determined is a "percolation rate and uses special equations to establish an infiltration rate from the data produced. The measured percolation rate was converted into infiltrated rate using "Porchet Method, aka Inverse Borehole Method" as shown below:

$I_t = \Delta H (60r)/ \Delta t(r + 2 H_{ave})$ *where:*

I_t – Converted Infiltration Rate (in/hr)

ΔH- Change in water height over the time interval (inches)

r – Test hole radius (inches)

Δt – Time interval (minutes)

H_{ave} – Average water head (water height) over the time interval (inches)

6.0 Results of Investigation

The results of double ring infiltrometer test performed in locations IF-1 through IF-4 are summarized in the following table:

Test Location	No of Trials Performed Until Steady State	Time Interval	Volume of Water Needed in Inner Ring in Each Trial at Steady State	Infiltration Rate (in./hr)
IF-1	18	5 mins (0.0833 hr)	14 $in.^3$	1.5 in./hr
IF-2	16	5 mins (0.0833 hr)	28 $in.^3$	3.0 in./hr
IF-3	16	5 mins (0.0833 hr)	23 $in.^3$	2.4 in./hr
IF-4	20	5 mins (0.0833 hr)	11.5 $in.^3$	1.2 in./hr

The results of the well permeameter test results at the steady state (number of total trials performed until steady state percolations is 16) are as follows:

Hole diameter = 8 inches

Total hole depth = 46 feet (552 inches)

Initial water depth at steady state = 36 feet (432 inches)

Final Water depth at steady state = 37.55 feet (450.6 inches)

Time interval Δt = 10 minutes

In order to calculate the infiltration rate as described in Section 5.4, the above data should be reduced as below:

r = 4 inches

H_{ave} = [(552-432) + (552-450.6)]/2 = 110.7 inches

ΔH = 450.6-432 = 18.6 inches

Calculated Infiltration Rate $I_t = \Delta H (60r)/ \Delta t(r + 2 H_{ave})$

$I_t = (18.6 \text{ in}) (60 \text{ min/hr}) (4 \text{ in})/ (10 \text{ min}) ((4 \text{ in}) + 2 (110.7 \text{ in}))$

$I_t = 2.0 \text{ in./hr}$

7.0 Recommendations

Based on our field infiltration study performed using double ring infiltrometer and well permeameter methods, the infiltration rate of the site soils at the tested locations ranges from 1.2 in./hr to 3.0 in./hr. As a reasonably conservative approach, the minimum measured field infiltration rate of 1.2 in/hr. may be considered in the initial feasibility screening stage. A factor of safety not less than 2.0 should be used to compute the design infiltration rate.

8.0 Limitations

This report has been prepared for the exclusive use of TSG Cherry Valley, L.P. relative to the design and construction of the proposed plan. This report is not intended for other parties, and it may not contain sufficient information for other purposes. The recommendations presented herein are of a general/conceptual nature and will be refined and detailed in forthcoming reports specific to various aspects of development. As such, the current recommendations may be subject to revision as additional detail of the project is made and additional data is developed, as well as in response to jurisdictional review requirements. This report is based on the plan as described and the information obtained as described herein.

The Owner or Owner Representative should make sure that the information and preliminary recommendations presented in this report are brought to the attention of the Project Architect and Project Engineer and incorporated into the project plans.

The findings contained in this report are based upon our evaluation and interpretation of the information obtained from the infiltration test pits and boring, as well as the geotechnical engineering analyses. The opinions and recommendations provided were based on the assumption that the geotechnical conditions, which exist across the site, are similar to those observed in the test excavations. The condition and characteristics of the sub-surface materials at locations and depths other than those excavated and observed my be different and no representations are made as to their quality and engineering properties. Should any conditions encountered during constuction differ from those

described herein, this office should be contacted immediately for evaluation of the actual conditions and for appropriate recommendations prior to continuation of work.

The finding and recommendations presented herein were obtained in accordance with currently accepted professional engineering principles and practice in the field of geologic and geotechnical engineering and reflect our best professional judgment. We make no other warranty, either expressed or implied.

This report is subject to review by the controlling authorities. If you have any questions or require additional information, please contact the undersigned.

We appreciate the opportunity to be of service and look forward to working with you and the other project consultants.

Unindurated, undissected

Qg *Alluvial gravel and sand of stream channels*
Qa *Alluvial sand, gravel and clay of level areas, covered by residual soil*

— *UNCONFORMITY* —

OLDER SURFICIAL SEDIMENTS
Weakly indurated alluvial fan deposits derived from local terrains

Qoa *Alluvial gravel and sand, light reddish brown and of granitic and gneissic detritus of San Bernardino Mountains in north areas, brownish gray in south area; top surface slopes slightly from source terrains*

— *UNCONFORMITY* —

SAN TIMOTEO FORMATION
(San Timoteo Beds of Frick, 1921) Stream laid alluvial sediments of detritus derived from plutonic and metamorphic rocks of San Bernadino Mountains NE of Banning Fault and deposited on plutonic and meta-sedimentary rocks of Peninsular Ranges NE of San Jacinto Fault zone; weakly indurated; upper part yielded verterbrate fauna diagnostic of Blancan Stage, Plio-Pleistocene (Frick, 1921, Savage et. al. 1954) or Irvingtonian Stage, earliest Pleistocene, (Repenningа 1987) lower or main part inferred to be of Pliocene age (Morton and Matti, 2001)

QTst *Upper part, sandstone, light gray to tan, fine to coarse grained arkosic and minor conglomerate of mostly granitic detritus, some gneissic and quartzitic detritus; includes thin layers of soft greenish to light reddish silty claystone, overlain by older alluvium*
QTsg *Conglomerate/fanglomerate, brownish gray, crudely bedded, of poorly sorted subrounded clasts of granitic and gneissic detritus in sandy matrix, base unexposed, overlain by older alluvium; probably proximal facies of upper part (**Qtst**); exposed adjacent to Banning fault*
Tst *Main part (middle part of Morton and Matti, 2001) sandstone, minor conglomerate and claystone, similar to those of upper part; comformably overlain by upper part (**QTst**), conformably underlain by Mount Eden Formation (Tme), but thins and buttresses eastward onto basement rocks as shown.*

MOUNT EDEN FORMATION
(of Frazier, 1931), present only near and SE of Mount Eden, stream laid sediments, clasts derived from basement rocks of Peninsular Ranges, moderately lithified, conformable below San Timateo Formation, overlies basement rocks; mostly sandstone,lithified divided into 4 members by Morton and Matti 2001; one member contains vertebrate fauna diagnostic of late Hemphillian Stage, middle Miocene, dated about 5.3 MA (Morton and Matti 2001)

Tme *Sandstone, medium grained, arkosic, includes interbeds of micaceous silty shale, strata light gray to light reddish maroon, locally contains concretions*
Tmg *Granitic conglomerate, composed of subrounded to subangular boulders and cobbles of light gray massive biotite-hornblende quartz diorite (tonalite), unsorted; form lenses within and at top of unit Tme, derived from quartz diorite to NE (Morton and Mattei, 2001)*

— *UNCONFORMITY* —

PLUTONIC ROCKS
medium grained holocrystalline granitic rocks; age, Cretaceous

gr *Granitic rock of Mount Eden, granite to monzo-granite (Morton and Matti, 2001) composed of quartz, potassic feldspar and sodic plagioclase feldspar in nearly equal amounts but with somewhat more potassic feldspar, scattered flakes of white mica and almost no mafic minerals, nearly white, massive; intrusive into meta-sedimentary rocks; exposed only near and SE of Mount Eden*
qdi *Granodiorite of east area; composed of quartz, potassic feldspar and sodic plagioclase feldspar in nearly equal amounts but with somewhat more sodic plagioclase feldspar, minor biotite, light gray, massive to very faintly gneissoid*
qdx *Quartz diorite (Bonzal Tonalite of Larsen, 1948) composed of about 1/3 quartz, 2/3 sodic plagioclase feldspar, minor potassic feldspar and 5-10% biotite and hornblende, light gray gneissoid, with abundant dark gray discoid inclusions (xenoliths) parallel to gneissoid foliation; exposed only at SW corner of quadrangle*
grq *Granitic rock exposed NE of Banning fault at NE corner, of quartz monzonite composition, of quartz, potassic feldspar and sodic plagioclasefeldspar in nearly equal amounts and about 5-10% biotite as evenly scattered flakes, light gray, massive, somewhat incoherent*

HORNBLENDE DIORITE GABBRO

hdg *Mafic rock exposed at NE corner of quadrangle NE of Banning fault; gray-black, medium grained, massive, composed of about 75% hornblende, 0-30% plagioclase feldspar, locally contains green epidote as secondary veinlets; age Mesozoic (Cretaceous)*

METASEDIMENTARY ROCKS
Remnants of metasedimentary petrolith of San Jacinto Mountains, exposed only near and SE of Mount Eden in this quadrangle; age inferred to be Paleozoic (Morton and Matti; 2001)

ms *Mica schist-phyllite, composed of biotite mica, feldspar and quartz, ranges to fine grained gneiss, locally includes calcsilicate skarn, dark gray, foliated along relict bedding planes*
ml *Marble, of calcite and dolomite, pale gray to white, medium to coarse grained, indistinctly bedded, locally contains skarn of diopside, wollastonite, fosterite, garnet and graphite (Morton and Matti 2001) occurs as layers and lenses in unit **ms***
mig *Mixture of metasedimentary rocks (schist–gneiss–**ms**) with quartz diorite (**qdx**); complexly migmatized, at southwest corner*

GNEISS

gn *Gray quartz-feldspar-biotite gneiss, thin bedded, hard but brittle: age, Precambrian (?), occurs as small pendant remnants engulfed in unit **grq** NE of Banning fault*

WQMP Project Report

County of Riverside Stormwater Program

Santa Ana River Watershed Geodatabase

Monday, October 13, 2014

Note: The information provided in this report and on the Stormwater Geodatabase for the County of Riverside Stormwater Program is intended to provide basic guidance in the preparation of the applicant's Water Quality Management Plan (WQMP) and should not be relied upon without independent verification.

Project Site Parcel Number(s):	413270012, 407090009, 413270013, 407090010, 407090015, 407220007, 413270008, 407090008, 407220008, 407220016, 407220009, 407220004, 407220017
Latitude/Longitude:	33.9724, -117.0229
Thomas Brothers Page:	690
Project Site Acreage:	224.41
Watershed(s):	SANTA ANA
This Project Site Resides in the following Hydrologic Unit (s) (HUC):	**HUC Name** - HUC Number **San Timoteo Canyon-San Timoteo Wash** - 180702030403
The HUCs Contribute stormwater to the following 303d listed water bodies and TMDLs which may include drainage from your proposed Project Site:	**WBID Name** - WBID Number **Santa Ana River, Reach 3** - CAR8012100019990211140353 **Santa Ana River, Reach 4** - CAR8012700019990211142130
These 303d listed Water bodies and TMDLs have the following Pollutants of Concern (POC):	**Bacterial Indicators** - Pathogens **Metals/Metalloids** - Copper, Lead
Is the Site subject to Hydromodification:	Yes
Limitations on Infiltration:	**Project Site Onsite Soils Group(s)** - A, C, D **Known Groundwater Contamination Plumes within 1000'** - No **Adjacent Water Supply Wells(s)** - No information available please contact your local water agency for more information. Your local contact agency is YUCAIPA VALLEY WATER DISTRICT. Your local wholesaler contact agency is SAN GORGONIO PASS WATER AGENCY.
Environmentally Sensitive Areas within 200'(Fish and Wildlife Habitat/Species):	None
Environmentally Sensitive Areas within 200'(CVMSHCP):	None

Extended Detention Basin Design Procedure	BMP Subarea No. A	Legend:	Required Entries / Calculated Cells

Company Name: ALBERT A. WEBB ASSOCIATES — Date: 13-Oct

Designed by: RC — County/City Case No.:

Design Volume

Tributary Area (BMP Subarea) — A_T = 43.3 acres

Enter $V_{BMP,}$ determined from Section 2.1 of this Handbook — V_{BMP} = 94,432 ft^3

Basin Footprint

Overall Geometry

Length at Basin Bottom Surface — Length = 1020 ft

Width at Basin Bottom Surface — Width = 40 ft

Meets 1.5 : 1 requirement? ✓

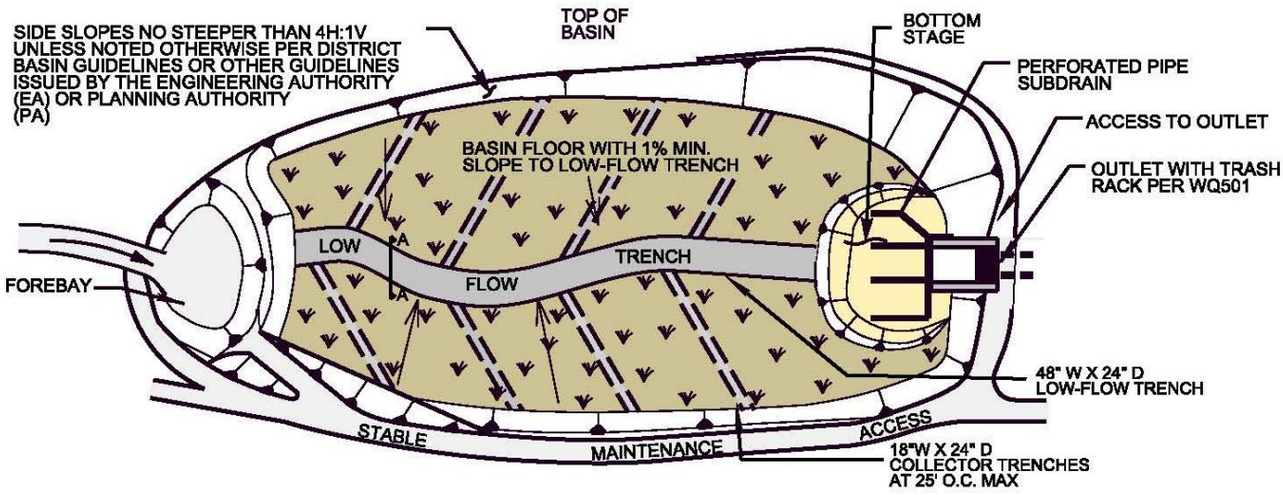
Side Slopes per "Basin Guidelines", Sect. 1.2 — H:V < 4:1, Verify Consistency with Basin Guidelines, Section 1.2 — z = 3 :1

Proposed Basin Depth (with no freeboard) — D_B = 5.00 ft

Depth of freeboard (if used) — D_{FB} = 1.00 ft

Minimum Required Allowance for Total Depth (including proposed basin depth, freeboard, minimum depth of bottom stage (D_{BS}=0.33') and minimum filter depth (D_{FD}=2.33')) — D_{REQ} = 8.7 ft

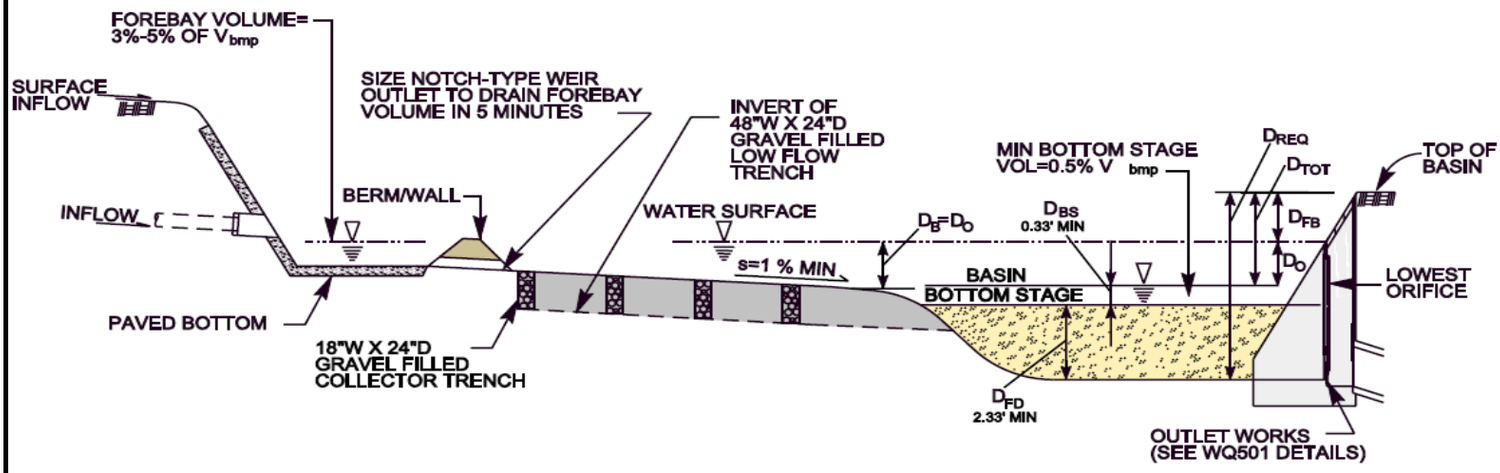
Depth from design water surface elevation to lowest orifice — D_O = 5.0 ft



Basin Design

Basin Design

Proposed Total Basin Depth (proposed depth plus freeboard)		D_{TOT} = 6.00	ft
Basin Invert Longitudinal Slope		Slope = 1.00	%
Basin Invert Transverse Slope (1% min)	Slope must be 1% minimum	Slope = 0.5	%
Basin Volume		V_{Basin} = 96790	ft^3



Forebay Design

Forebay Volume (3 - 5% V_{BMP})		V_{FB} = 4500	ft^3
Forebay Depth (height of berm)		D_{FBY} = 1	ft
Minimum Forebay Surface Area		A_{FB} = 4500	ft^2
Rectangular weir (notch)		W = 12.00	in

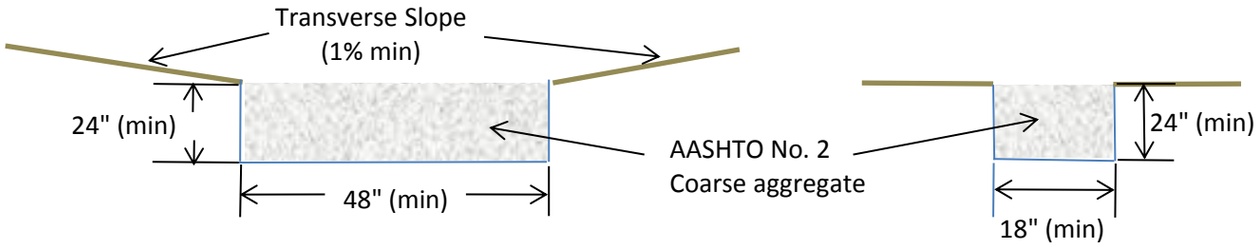
Dry Weather and Low-Flow Management

Low-Flow Trench (see graphic below)

Depth (24 inches minimum, gravel filled)	Depth =	24	inches
Width (48 inches minimum)	Width =	48	inches
Trench Invert Longitudinal Slope	Slope =	0.5	%

Collector Trenches (see graphic below)

Depth (24 inches minimum)	Depth =	24	inches
Width (18 inches minimum)	Width =	18	inches
Trench Invert Longitudinal Slope	Slope =	0.5	%
Spacing (25 feet on center maximum)	S =	25	feet



Low-Flow Trench **Collector Trench**

Bottom Stage (Sand Filter) Design

Depth of the Bottom Stage (4" minimum ponding)	D_{BS} =	6	in
Surface Area of Bottom Stage	A_{BS} =	500	ft^2
Dry Weather Ponded Volume (above sand layer)	V_{BS} =	250	ft^3

Is V_{BS} no less than 0.5% V_{BMP}? OK

Depth of ASTM-C33 sand (18 inch minimum)

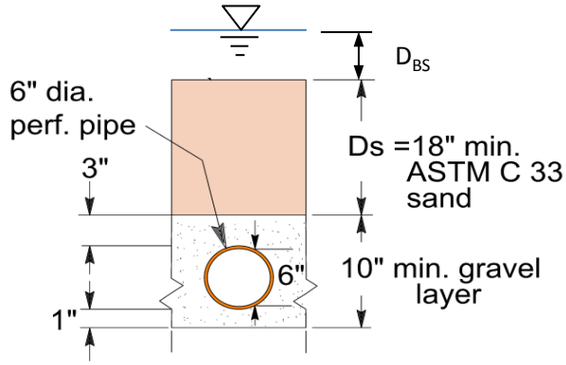
Ds = 18 inches

Diameter of Subdrains

ϕ = 6 in

Subdrain Spacing

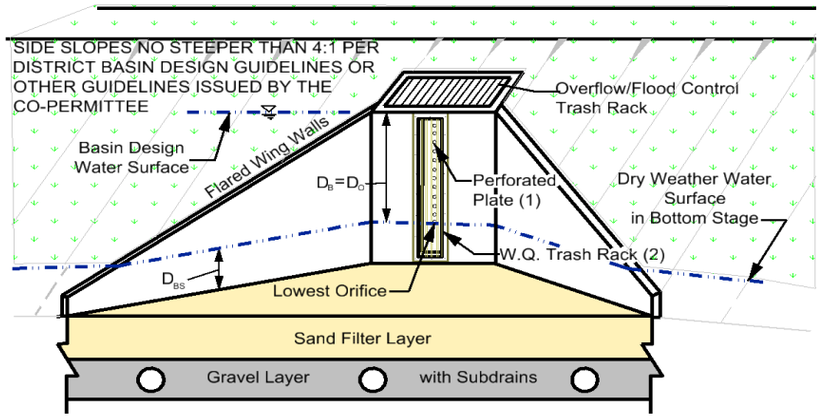
s = 10 ft. on center



Basin Outlet Design

Outlet Design

Assume an orifice area. Based on the information provided above, the spreadsheet provides discharge vs. stage data. Enter the volume vs. stage data for each interval. This information is used to route the volume through the basin. The size of the orifice is acceptable when the data shows that less than 50% of V_{BMP} has drained in 24 hours, and that 100% drawdown occurs within 72 hours.



Flow Rate, Q (cfs)

$$Q=CA[2g(H-H_o)]^{0.5}$$

Discharge Coefficient,

Default, C = 0.66

Other, C =

Orifice Area (ft^2)

Orifice Diameter, d; number of orifices per row, n; and number of orifice rows, N (from the bottom up).

d = 2.5 inches

n = 2 per row

N = 1 rows

Aeff = 0.068 ft^2 per row

or

Aeff = 9.813 in^2 per row

From outflow hydrograph, the time where 50% of V_{BMP} has drained from the basin (24 hour minimum):

Time (50%) = 29.12 hrs

OK

From outflow hydrograph, the time where 100% V_{BMP} has drained from the basin(within 72 hours):

Time (100 %) = 59.92 hrs

OK

Extended Detention Basin Design Procedure	BMP Subarea No. B	Legend:	Required Entries / Calculated Cells

Company Name: ALBERT A. WEBB ASSOCIATES — Date: 14-Oct

Designed by: RC — County/City Case No.:

Design Volume

Tributary Area (BMP Subarea) — A_T = 60.7 acres

Enter $V_{BMP,}$ determined from Section 2.1 of this Handbook — V_{BMP} = 116,126 ft^3

Basin Footprint

Overall Geometry

Length at Basin Bottom Surface — Length = 750 ft

Width at Basin Bottom Surface — Width = 250 ft

Meets 1.5 : 1 requirement? ✓

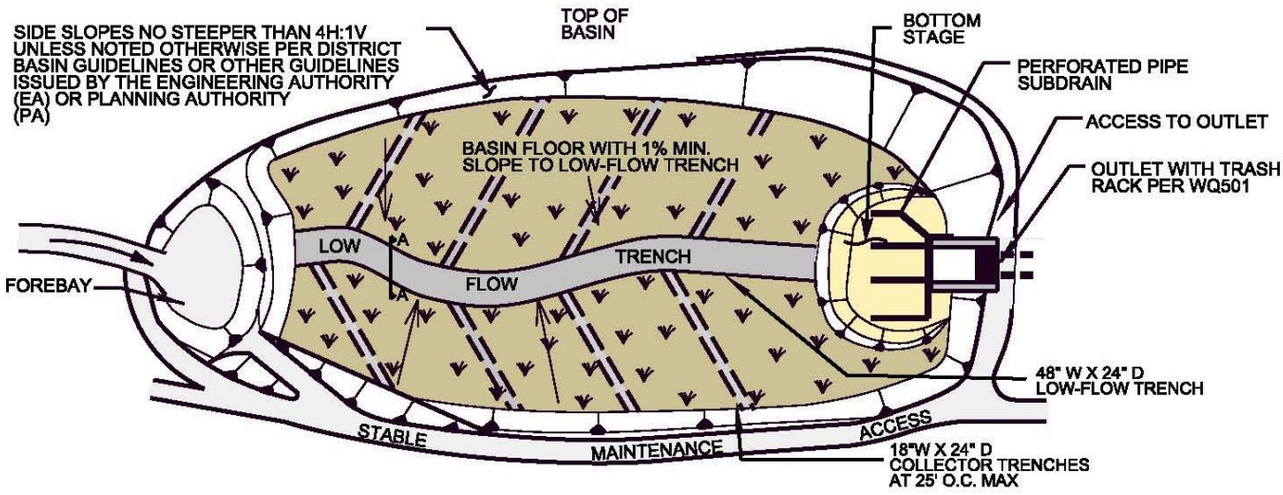
Side Slopes per "Basin Guidelines", Sect. 1.2 — H:V < 4:1, Verify Consistency with Basin Guidelines, Section 1.2 — z = 3 :1

Proposed Basin Depth (with no freeboard) — D_B = 3.00 ft

Depth of freeboard (if used) — D_{FB} = 1.00 ft

Minimum Required Allowance for Total Depth (including proposed basin depth, freeboard, minimum depth of bottom stage (D_{BS}=0.33') and minimum filter depth (D_{FD}=2.33')) — D_{REQ} = 6.7 ft

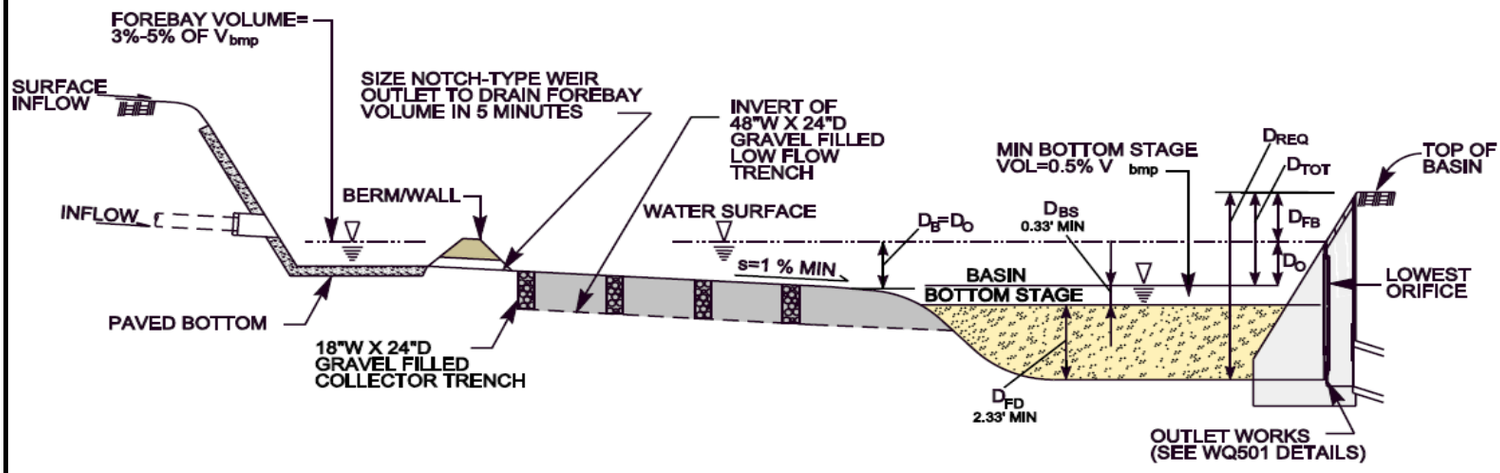
Depth from design water surface elevation to lowest orifice — D_O = 3.0 ft



Basin Design

Basin Design

Proposed Total Basin Depth (proposed depth plus freeboard)		D_{TOT} =	4.00 ft
Basin Invert Longitudinal Slope	Minimum Slope is 1%	Slope =	0.50 %
Basin Invert Transverse Slope (1% min)		Slope =	1 %
Basin Volume		V_{Basin} =	499532 ft^3



Forebay Design

Forebay Volume (3 - 5% V_{BMP})		V_{FB} =	5000 ft^3
Forebay Depth (height of berm)		D_{FBY} =	1 ft
Minimum Forebay Surface Area		A_{FB} =	5000 ft^2
Rectangular weir (notch)		W =	12.00 in

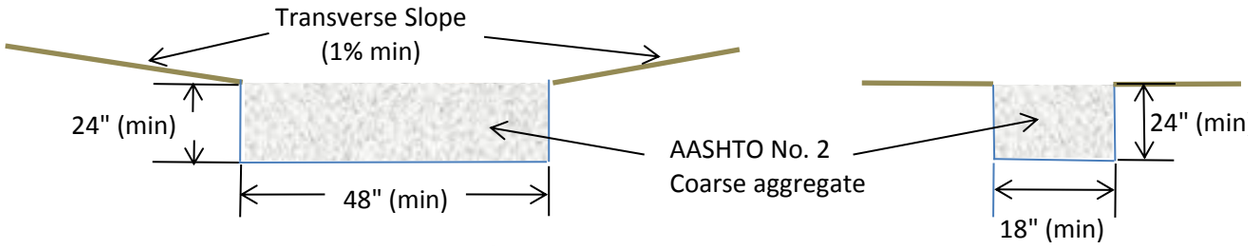
Dry Weather and Low-Flow Management

Low-Flow Trench (see graphic below)

Depth (24 inches minimum, gravel filled)	Depth =	24	inches
Width (48 inches minimum)	Width =	48	inches
Trench Invert Longitudinal Slope	Slope =	0.5	%

Collector Trenches (see graphic below)

Depth (24 inches minimum)	Depth =	24	inches
Width (18 inches minimum)	Width =	18	inches
Trench Invert Longitudinal Slope	Slope =	0.5	%
Spacing (25 feet on center maximum)	S =	25	feet



Low-Flow Trench **Collector Trench**

Bottom Stage (Sand Filter) Design

Depth of the Bottom Stage (4" minimum ponding)	D_{BS} =	6	in
Surface Area of Bottom Stage	A_{BS} =	500	ft^2
Dry Weather Ponded Volume (above sand layer)	V_{BS} =	250	ft^3

Is V_{BS} no less than 0.5% V_{BMP}? OK

Depth of ASTM-C33 sand (18 inch minimum)

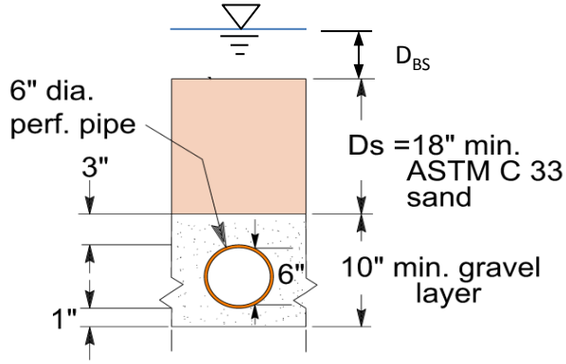
Ds = 18 inches

Diameter of Subdrains

ϕ = 6 in

Subdrain Spacing

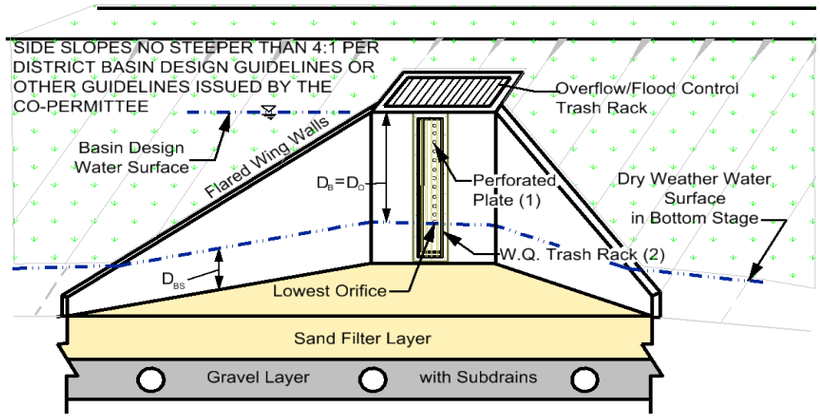
s = 10 ft. on center



Basin Outlet Design

Outlet Design

Assume an orifice area. Based on the information provided above, the spreadsheet provides discharge vs. stage data. Enter the volume vs. stage data for each interval. This information is used to route the volume through the basin. The size of the orifice is acceptable when the data shows that less than 50% of V_{BMP} has drained in 24 hours, and that 100% drawdown occurs within 72 hours.



Flow Rate, Q (cfs)

$$Q=CA[2g(H-H_o)]^{0.5}$$

Discharge Coefficient,

Default, C = 0.66

Other, C =

Orifice Area (ft^2)

Orifice Diameter, d; number of orifices per row, n; and number of orifice rows, N (from the bottom up).

d = 3.5 inches

n = 2 per row

N = 1 rows

Aeff = 0.134 ft^2 per row

or

Aeff = 19.233 in^2 per row

From outflow hydrograph, the time where 50% of V_{BMP} has drained from the basin (24 hour minimum):

Time (50%) = 25.16 hrs

OK

From outflow hydrograph, the time where 100% V_{BMP} has drained from the basin(within 72 hours):

Time (100 %) = 48.10 hrs

OK

Headwater Elev. / Stage (ft)	Discharge (cfs)	Volume (acre-ft)	Δt (hrs.)

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

14-0213 SHOPOFF
UNIT HYDROGRAPH
DMA A
EXISTING CONDITIONS
2-YEAR 24-HOUR

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 43.30(Ac.) = 0.068 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 43.30(Ac.) = 0.068 Sq. Mi.
Length along longest watercourse = 3310.00(Ft.)
Length along longest watercourse measured to centroid = 970.00(Ft.)
Length along longest watercourse = 0.627 Mi.
Length along longest watercourse measured to centroid = 0.184 Mi.
Difference in elevation = 30.00(Ft.)
Slope along watercourse = 47.8550 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.076 Hr.
Lag time = 4.56 Min.
25% of lag time = 1.14 Min.
40% of lag time = 1.82 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	2.60	112.58

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	7.00	303.10

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 2.600(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.600(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
0.000	62.00	0.900
43.300	62.00	0.900

Total Area Entered = 43.30(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
62.0	42.0	0.650	0.900	0.124	0.000	0.000
62.0	42.0	0.650	0.900	0.124	1.000	0.124
					Sum (F) =	0.124

Area averaged mean soil loss (F) (In/Hr) = 0.124
Minimum soil loss rate ((In/Hr)) = 0.062
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.180

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 60.70(Ac.) = 0.095 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 60.70(Ac.) = 0.095 Sq. Mi.
Length along longest watercourse = 3720.00(Ft.)
Length along longest watercourse measured to centroid = 2000.00(Ft.)
Length along longest watercourse = 0.705 Mi.
Length along longest watercourse measured to centroid = 0.379 Mi.
Difference in elevation = 105.00(Ft.)
Slope along watercourse = 149.0323 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.084 Hr.
Lag time = 5.05 Min.
25% of lag time = 1.26 Min.
40% of lag time = 2.02 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	2.60	157.82

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	7.00	424.90

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 2.600(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.600(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
60.700	64.00	0.900

Total Area Entered = 60.70(Ac.)

RI	RI	Infil. Rate	Impervious	Adj. Infil. Rate	Area%	F

AMC2	AMC-1	(In/Hr)	(Dec.%)	(In/Hr)	(Dec.)	(In/Hr)
64.0	44.0	0.631	0.900	0.120	1.000	0.120
					Sum (F) =	0.120

Area averaged mean soil loss (F) (In/Hr) = 0.120
Minimum soil loss rate ((In/Hr)) = 0.060
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.180

Introduction

The purpose of this preliminary hydrology study is to present the hydrology analysis and drainage calculations prepared in conjunction with the design and future construction of the Shopoff – San Gorgonio Crossings warehouse facility in Riverside County.

Project Description

The Shopoff – San Gorgonio Crossings project proposes to develop approximately 150 acres of vacant land between Calimesa and Beaumont. The project is located northeast of the intersection of I-10 and Cherry Valley Boulevard. The project proposes to build 2 warehouse/distribution facilities totaling approximately 1,819,000 SF with associated parking, loading docks, drive aisles, and landscaped areas.

Hydrologic Analysis and Methodology

Hydrologic calculations were performed in accordance to the methods described in the Riverside County Flood Control and Water Conservation District Hydrology Manual. The Civil Design Version 7.1 Computer Software Program was used in performing the hydrology calculations.

The Rational Method was performed to evaluate surface runoff under proposed conditions associated with the 100-year storm frequency from the project watershed. The results were used to calculate on-site storm drain pipe sizes. The on-site pipe sizes range from 24” to 42”. See the Rational Method Exhibits for more information (Appendix B).

The Unit Hydrograph Method was performed to evaluate the Flood Volumes and Peak Flows for the 2-yr 24-hr event, 10-yr 24-hr and the 100-yr events. The results were used to determine mitigation requirements for the site and basin depths (See Appendix C).

Basin Routing was performed to model the proposed basins and outlet structures. The proposed basins are designed to meet the Design Capture Volume requirements and to mitigate the 2-yr 24-hr event, 10-yr 24-hr event, and the 100-yr storm events (See Appendix D). The 2-year mitigation complies with the requirements of the Hydrological Conditions of Concern (HCOC) related to the water quality technical guidance document.

Existing On-Site Drainage Facilities

The site is presently vacant with little vegetation. Elevations on the site vary from 2580 feet above mean sea level (MSL) to 2380 feet. The existing site drains to a natural channel which conveys the runoff to a basin west of Roberts Street which conveys the water to San Timoteo Creek. Off-site flows from the northeast enter the channel and flow through the site.

Hydrological Data

Based on the site’s location, the following site data is referenced from the Riverside County Flood Control and Water Conservation District Hydrology Manual (See Appendix A):

Hydrologic Soil Type

The soils map on Plate C-1.18 indicated the following Soil Types:

- Soils Group "B" – 62%
- Soils Group "D" – 38%

Rainfall Data

The following precipitation data was taken from the Riverside County Flood Control and Water Conservation District Hydrology Manual:

- 2-Year 24-Hour Rainfall Intensity – 2.6 inches/hour (Plate E-5.5)
- 100-Year 24-Hour Rainfall Intensity – 7 inches/hour (Plate E-5.6)

Runoff Index

The Runoff Index (RI) values were determined from Plate D-5.5 with AMCII conditions:

- Existing Conditions DMA A: Barren (Rockland, eroded, graded land) B and D: 88
- Existing Conditions DMA B: Barren (Rockland, eroded, graded land) B and D: 89
- Proposed Conditions DMA A: Commercial Landscaping with Soils Group B and D: 62
- Proposed Conditions DMA B: Commercial Landscaping with Soils Group B and D: 64

Land Use

The Actual Impervious Cover values were determined from Plate D-5.6:

- Existing Conditions: Natural or Agriculture – 0%
- Proposed Conditions: Commercial or Industrial – 90%

Proposed On-Site Drainage Facilities

The proposed site will replace the natural channel with an improved channel which will convey off-site runoff and treated on-site flows to the west toward the basin west of Roberts Street. The northerly off-site flows will be conveyed to the west by a channel and will not enter the site. All flows will continue to reach San Timoteo Creek.

The Design Capture Volume and HCOC will be addressed by two Extended Detention Basins.

Building #1 (west building) with associated parking, loading docks, drive aisles, and landscaped areas will drain to Extended Detention Basin A. Building #2 (east building) with associated parking, loading docks, drive aisles, and landscaped areas will drain to Extended Detention Basin B. The runoff will be conveyed to each basin by surface flow and an on-site storm drain system. Each basin will outlet to a storm drain pipe which discharges to the on-site channel along the southern property boundary which conveys off-site flows through the site.

Extended Detention Basin A

Runoff will enter Basin A primarily from the on-site storm drain system. The middle of the basin will be the lowest elevation and slope up to the north and south at 0.5%. A low-flow trench and collector trenches will convey the runoff to the bottom stage and outlet structure which will be located in the middle of the basin on the east side. The outlet structure has been designed to allow for treatment of the Design Capture Volume. The Vbmp depth is 3.4 ft. The outlet structure has also been designed to mitigate the 2-yr 24-hr and 10-yr 24-hr events with orifices and the 100-yr event will spill over the top of the outlet structure. The basin depth will be 7.2 ft,

including 1 ft of freeboard. See Figure 1 below and Appendix D for Basin Routing Calculations for more information.

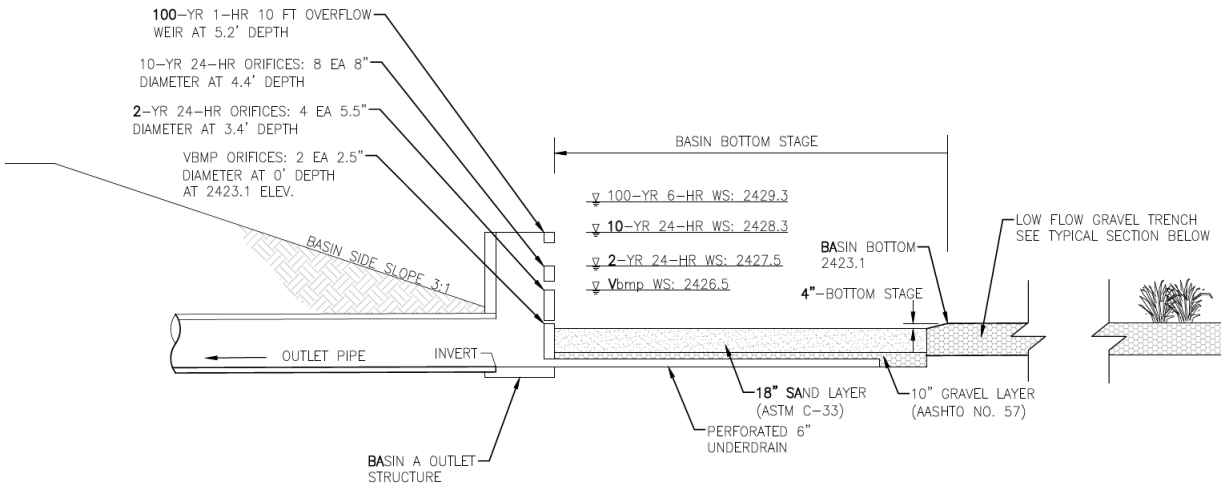

Figure 1. Extended Detention Basin A Outlet Structure Schematic Detail

Extended Detention Basin B

Runoff will enter Basin B primarily from the on-site storm drain systems. The middle of the basin will be the lowest elevation and slope up to the north and south at 0.5%. A low-flow trench and collector trenches will convey the runoff to the bottom stage and outlet structure which will be located in the middle of the basin on the west side. The outlet structure has been designed to allow for treatment of the Design Capture Volume. The Vbmp depth is 1.9 ft. The outlet structure has also been designed to mitigate the 2-yr 24-hr and 10-yr 24-hr events with orifices and the 100-yr event will spill over the top of the outlet structure. The basin depth will be 4.6 ft, including 1 ft of freeboard. See Figure 2 below and Appendix D for Basin Routing Calculations for more information.

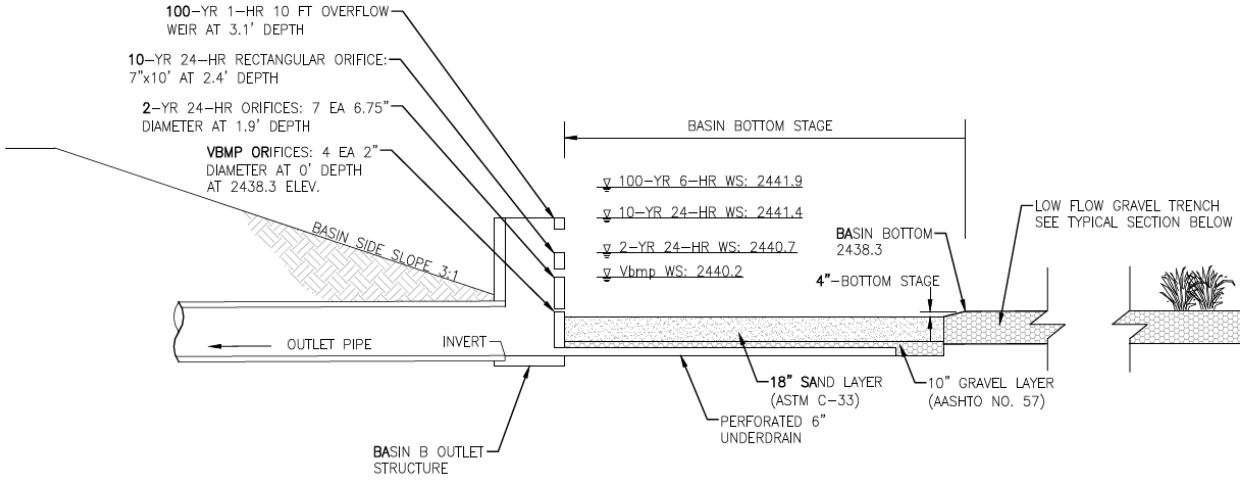

Figure 2. Extended Detention Basin B Outlet Structure Schematic Detail

Conclusion

Based upon the results of this report, the proposed facilities, with ultimate development and adequate maintenance, will convey flows safely through the region to the MDP facilities in accordance with Riverside County Requirements. Additional hydrological analyses will be performed as part of the final site specific engineering wherein finer details of the proposed design will be established.

IMPERVIOUS COVER DATA

ACTUAL IMPERVIOUS COVER

Land Use (1)	Range-Percent	Recommended Value For Average Conditions-Percent(2)
Natural or Agriculture	0 - 10	0
Single Family Residential: (3)		
40,000 S. F. (1 Acre) Lots	10 - 25	20
20,000 S. F. (½ Acre) Lots	30 - 45	40
7,200 - 10,000 S. F. Lots	45 - 55	50
Multiple Family Residential:		
Condominiums	45 - 70	65
Apartments	65 - 90	80
Mobile Home Park	60 - 85	75
Commercial, Downtown Business or Industrial	80 -100	90

Notes:

1. Land use should be based on ultimate development of the watershed. Long range master plans for the County and incorporated cities should be reviewed to insure reasonable land use assumptions.

2. Recommended values are based on average conditions which may not apply to a particular study area. The percentage impervious may vary greatly even on comparable sized lots due to differences in dwelling size, improvements, etc. Landscape practices should also be considered as it is common in some areas to use ornamental gravels underlain by impervious plastic materials in place of lawns and shrubs. A field investigation of a study area should always be made, and a review of aerial photos, where available may assist in estimating the percentage of impervious cover in developed areas.

3. For typical horse ranch subdivisions increase impervious area 5 percent over the values recommended in the table above.

RUNOFF INDEX NUMBERS

RUNOFF INDEX NUMBERS OF HYDROLOGIC SOIL-COVER COMPLEXES FOR PERVIOUS AREAS-AMC II

Cover Type (3)	Quality of Cover (2)	Soil Group A	B	C	D
NATURAL COVERS -					
Barren (Rockland, eroded and graded land)		78	86	91	93
Chaparrel, Broadleaf (Manzonita, ceanothus and scrub oak)	Poor	53	70	80	85
	Fair	40	63	75	81
	Good	31	57	71	78
Chaparrel, Narrowleaf (Chamise and redshank)	Poor	71	82	88	91
	Fair	55	72	81	86
Grass, Annual or Perennial	Poor	67	78	86	89
	Fair	50	69	79	84
	Good	38	61	74	80
Meadows or Cienegas (Areas with seasonally high water table, principal vegetation is sod forming grass)	Poor	63	77	85	88
	Fair	51	70	80	84
	Good	30	58	72	78
Open Brush (Soft wood shrubs - buckwheat, sage, etc.)	Poor	62	76	84	88
	Fair	46	66	77	83
	Good	41	63	75	81
Woodland (Coniferous or broadleaf trees predominate. Canopy density is at least 50 percent)	Poor	45	66	77	83
	Fair	36	60	73	79
	Good	28	55	70	77
Woodland, Grass (Coniferous or broadleaf trees with canopy density from 20 to 50 percent)	Poor	57	73	82	86
	Fair	44	65	77	82
	Good	33	58	72	79
URBAN COVERS -					
Residential or Commercial Landscaping (Lawn, shrubs, etc.)	Good	32	56	69	75
Turf (Irrigated and mowed grass)	Poor	58	74	83	87
	Fair	44	65	77	82
	Good	33	58	72	79
AGRICULTURAL COVERS -					
Fallow (Land plowed but not tilled or seeded)		76	85	90	92

**** CONFLUENCE OF MINOR STREAMS ****
________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =      3.600(Ac.)
Runoff from this stream =     10.091(CFS)
Time of concentration =   11.94 min.
Rainfall intensity =     3.280(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                 (In/Hr)

1      113.350     14.89                2.905
2       10.091     11.94                3.280
Largest stream flow has longer time of concentration
Qp =    113.350 + sum of
          Qb         Ia/Ib
          10.091 *    0.886 =      8.938
Qp =    122.287

Total of 2 streams to confluence:
Flow rates before confluence point:
     113.350      10.091
Area of streams before confluence:
       38.500        3.600
Results of confluence:
Total flow rate =    122.287(CFS)
Time of concentration =    14.893 min.
Effective stream area after confluence =     42.100(Ac.)
End of computations, total study area =           42.10 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.

Area averaged pervious area fraction(Ap) = 0.177
Area averaged RI index number =  66.6

**** CONFLUENCE OF MINOR STREAMS ****
________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =     26.100(Ac.)
Runoff from this stream =     75.703(CFS)
Time of concentration =   13.98 min.
Rainfall intensity =     3.008(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                  (In/Hr)

1       92.755     16.83                2.716
2       75.703     13.98                3.008
Largest stream flow has longer time of concentration
Qp =     92.755 + sum of
          Qb         Ia/Ib
          75.703 *    0.903 =     68.357
Qp =    161.112

Total of 2 streams to confluence:
Flow rates before confluence point:
      92.755      75.703
Area of streams before confluence:
       34.700       26.100
Results of confluence:
Total flow rate =    161.112(CFS)
Time of concentration =    16.829 min.
Effective stream area after confluence =     60.800(Ac.)
End of computations, total study area =           60.80 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.

Area averaged pervious area fraction(Ap) = 0.153
Area averaged RI index number =  63.8
```

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 43.30(Ac.) = 0.068 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 43.30(Ac.) = 0.068 Sq. Mi.
Length along longest watercourse = 1700.00(Ft.)
Length along longest watercourse measured to centroid = 910.00(Ft.)
Length along longest watercourse = 0.322 Mi.
Length along longest watercourse measured to centroid = 0.172 Mi.
Difference in elevation = 94.00(Ft.)
Slope along watercourse = 291.9529 Ft./Mi.
Average Manning's 'N' = 0.040
Lag time = 0.109 Hr.
Lag time = 6.53 Min.
25% of lag time = 1.63 Min.
40% of lag time = 2.61 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	2.60	112.58

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	7.00	303.10

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 4.410(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.410(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
43.300	88.00	0.000

Total Area Entered = 43.30(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)

88.0	88.0	0.153	0.000	0.153	1.000	0.153
					Sum (F) =	0.153

Area averaged mean soil loss (F) (In/Hr) = 0.153
Minimum soil loss rate ((In/Hr)) = 0.076
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

EXISTING CONDITIONS
2-YEAR 24-HOUR

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 43.30(Ac.) = 0.068 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 43.30(Ac.) = 0.068 Sq. Mi.
Length along longest watercourse = 3310.00(Ft.)
Length along longest watercourse measured to centroid = 970.00(Ft.)
Length along longest watercourse = 0.627 Mi.
Length along longest watercourse measured to centroid = 0.184 Mi.
Difference in elevation = 30.00(Ft.)
Slope along watercourse = 47.8550 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.076 Hr.
Lag time = 4.56 Min.
25% of lag time = 1.14 Min.
40% of lag time = 1.82 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	2.60	112.58

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	7.00	303.10

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 2.600(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.600(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
0.000	62.00	0.900
43.300	62.00	0.900

Total Area Entered = 43.30(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
62.0	42.0	0.650	0.900	0.124	0.000	0.000
62.0	42.0	0.650	0.900	0.124	1.000	0.124
					Sum (F) =	0.124

Area averaged mean soil loss (F) (In/Hr) = 0.124
Minimum soil loss rate ((In/Hr)) = 0.062
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.180

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 43.30(Ac.) = 0.068 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 43.30(Ac.) = 0.068 Sq. Mi.
Length along longest watercourse = 3310.00(Ft.)
Length along longest watercourse measured to centroid = 970.00(Ft.)
Length along longest watercourse = 0.627 Mi.
Length along longest watercourse measured to centroid = 0.184 Mi.
Difference in elevation = 30.00(Ft.)
Slope along watercourse = 47.8550 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.076 Hr.
Lag time = 4.56 Min.
25% of lag time = 1.14 Min.
40% of lag time = 1.82 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	2.60	112.58

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
43.30	7.00	303.10

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 4.410(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.410(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
43.300	62.00	0.900

Total Area Entered = 43.30(Ac.)

RI	RI	Infil. Rate	Impervious	Adj. Infil. Rate	Area%	F

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

14-0213 SHOPOFF
UNIT HYDROGRAPH
DMA B
EXISTING CONDITIONS
10-YEAR 24-HOUR

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 60.70(Ac.) = 0.095 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 60.70(Ac.) = 0.095 Sq. Mi.
Length along longest watercourse = 2985.00(Ft.)
Length along longest watercourse measured to centroid = 1550.00(Ft.)
Length along longest watercourse = 0.565 Mi.
Length along longest watercourse measured to centroid = 0.294 Mi.
Difference in elevation = 161.00(Ft.)
Slope along watercourse = 284.7839 Ft./Mi.
Average Manning's 'N' = 0.040
Lag time = 0.166 Hr.
Lag time = 9.95 Min.
25% of lag time = 2.49 Min.
40% of lag time = 3.98 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	2.60	157.82

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	7.00	424.90

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 4.410(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.410(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
60.700	89.00	0.000

Total Area Entered = 60.70(Ac.)

RI	RI	Infil. Rate	Impervious	Adj. Infil. Rate	Area%	F

AMC2	AMC-2	(In/Hr)	(Dec.%)	(In/Hr)	(Dec.)	(In/Hr)
89.0	89.0	0.141	0.000	0.141	1.000	0.141
					Sum (F) =	0.141

Area averaged mean soil loss (F) (In/Hr) = 0.141
Minimum soil loss rate ((In/Hr)) = 0.071
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

UNIT HYDROGRAPH
DMA B
PROPOSED CONDITIONS
2-YEAR 24-HOUR

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 60.70(Ac.) = 0.095 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 60.70(Ac.) = 0.095 Sq. Mi.
Length along longest watercourse = 3720.00(Ft.)
Length along longest watercourse measured to centroid = 2000.00(Ft.)
Length along longest watercourse = 0.705 Mi.
Length along longest watercourse measured to centroid = 0.379 Mi.
Difference in elevation = 105.00(Ft.)
Slope along watercourse = 149.0323 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.084 Hr.
Lag time = 5.05 Min.
25% of lag time = 1.26 Min.
40% of lag time = 2.02 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	2.60	157.82

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	7.00	424.90

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 2.600(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.600(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
60.700	64.00	0.900

Total Area Entered = 60.70(Ac.)

RI	RI	Infil. Rate	Impervious	Adj. Infil. Rate	Area%	F

AMC2	AMC-1	(In/Hr)	(Dec.%)	(In/Hr)	(Dec.)	(In/Hr)
64.0	44.0	0.631	0.900	0.120	1.000	0.120
					Sum (F) =	0.120

Area averaged mean soil loss (F) (In/Hr) = 0.120
Minimum soil loss rate ((In/Hr)) = 0.060
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.180

PROPOSED CONDITIONS
10-YEAR 24-HOUR

Program License Serial Number 4010

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

Drainage Area = 60.70(Ac.) = 0.095 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 60.70(Ac.) = 0.095 Sq. Mi.
Length along longest watercourse = 3720.00(Ft.)
Length along longest watercourse measured to centroid = 2000.00(Ft.)
Length along longest watercourse = 0.705 Mi.
Length along longest watercourse measured to centroid = 0.379 Mi.
Difference in elevation = 105.00(Ft.)
Slope along watercourse = 149.0323 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.084 Hr.
Lag time = 5.05 Min.
25% of lag time = 1.26 Min.
40% of lag time = 2.02 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	2.60	157.82

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
60.70	7.00	424.90

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 2.600(In)
Area Averaged 100-Year Rainfall = 7.000(In)

Point rain (area averaged) = 4.410(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.410(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
60.700	64.00	0.900

Total Area Entered = 60.70(Ac.)

RI	RI	Infil. Rate	Impervious	Adj. Infil. Rate	Area%	F

AMC2	AMC-2	(In/Hr)	(Dec.%)	(In/Hr)	(Dec.)	(In/Hr)
64.0	64.0	0.427	0.900	0.081	1.000	0.081
					Sum (F) =	0.081

Area averaged mean soil loss (F) (In/Hr) = 0.081
Minimum soil loss rate ((In/Hr)) = 0.041
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.180

Process from Point/Station 1.000 to Point/Station 2.000
**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 295
Hydrograph time unit = 5.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.000	0.000	0.000	0.000

SECTION 1 - Summary

Introduction

Parcel Map 36564, also known as San Gorgonio Crossings is located within the Santa Ana River watershed, at foothill of San Gorgonio Mountain range, in the unincorporated area of Riverside County. More specifically, the project site is at north of Cherry Valley Blvd., East of I-10 Freeway and Calimesa Boulevard, and west of Hannon Road. Parcel Map 36546 is approximately a 150-acre net-area proposed for Industrial Park/ Distribution Center uses. The northerly and westerly of the parcel boundary is bordering the City of Calimesa.

This report is primarily addressing the off-site drainage issues. Study Area is in the Santa Ana River Watershed, and is comprised of approximately 1,162 acres, of mountainous terrain to the north and foothill areas to the south. Approximately 990 acres of off-site areas, lying to the north and east of the project site, drains through the project site in a northeast to southwest direction. The project site is not within the boundary of any master drainage plans. There are no existing storm drain facilities with the study area. Runoff exits the study area at two points of discharge (exit nodes) located at the westerly boundary of the site.

The purpose of this study is to evaluate storm runoffs for the existing conditions and the developed conditions at two point of discharge, and to ensure that the increases of the runoff due to the site development are properly mitigated through the on-site extended detention basins. Secondly, it is to develop a conceptual flood control facilities to safely collect and convey the 100-year off-site storm runoffs through the site. This study is to present the hydrologic and hydraulic analysis prepared in conjunction with the onsite drainage studies, and also to determine that the proposed drainage facilities meet the design criteria set forth in Riverside County Flood Control and Water Conservation District Hydrology Manual.

Existing Site Conditions

Under existing conditions the project site study area is generally undeveloped with steep terrain and natural watercourses in the upper portions. Based on the points of discharge of the existing watercourses, the study area is divide into two major drainage areas identified as Drainage Area "A" and Drainage Area "B", as shown in *Existing Condition Hydrology Map.* Each drainage area is tributary to a discharge point (exit node) along the westerly boundary of the project site.

Drainage Area "A" is comprised of approximate 903.3 acres, with peak storm water discharge rates of approximately 739.7 cfs and 1,171.4 cfs, for 10-year and 100-year storms, respectively.

Drainage Area "B" is comprised of approximately 258.1 acres with peak discharge rates of 359.4 cfs and 563.2 cfs, for 10-year and100-year storms, respectively.

Existing Drainage Facilities

Except a paved drainage ditch along north side Cherry Valley Boulevard, there are no existing drainage facilities in the immediate project vicinity.

Hydrologic Analysis

Design Criteria

Hydrologic calculations were computed in accordance with the parameters outlined in Riverside County Flood Control and Water Conservation District Hydrology Manual. Specifically, the rational method was used for the watershed less than 300 areas. The synthetic unit hydrograph method was use for the larger watershed to determine the discharges for the 100-year storm in existing and off-site conditions. The on-site drainage study depicts the on-site hydrology and storm drain system as well as the extended detention basins. The routed storm runoffs from the on-site drainage study were introduced to the concrete channels for overall developed flow calculations.

Hydraulic Analysis

According to the Riverside County Flood Control and Water Conservation District (RCFC&WCD) Hydrology Manual, the 10-year flood shall be contained within the top of curbs and the 100-year flood shall be contained within street right-of-way limits. All on-site and off-site storm drain system is designed for the 100-year storm event.

The hydraulic analysis of storm drain systems was performed using the Water Surface and Pressure Gradient Hydraulic Analysis software (WSPG), developed by Los Angeles County Department of Public Works. The roughness coefficient n=0.013 for RCP is used for storm drain design and n=0.015 is used for concrete channel design. A preliminary WSPG for drainage Watershed-A Storm Drain Line-A is provided for reference. Adjustments for the alignment, grade and size of the channel may be made during the final design.

Calculations for Debris Production Rates (for off-site areas) are based on U.S. Army Corps of Engineers' Los Angeles District Debris Method; and, Bulking Factors for the preliminary sizing of facilities conveying potentially debris laden flows are based on the Peak Bulking Factor curves in Los Angeles County Department of Public Work's Sedimentation Manual.

A bulking factor of 1.4 was applied for off-site flow for storm drain and channel capacity calculations.

Proposed Drainage Facilities

The proposed on-site drainage system, inlets and extended detention basins are per On-Site Drainage Report. The proposed off-site drainage facilities include the following:

1. Line A – Storm drain Line-A system consists reinforced concrete boxes and concrete trap channels located on south side of the buildings convey 100-year 1-hour peak storm runoffs from offsite Areas A1 and A2, 25.9 acres of on-site self-treated areas and on-site extended basins outflow (routed). The off-site flow rates are bulked with a factor of 1.4 for debris laden flows, also a 100 CFS offsite flow is diverted to the on-site wetland mitigation areas. Lateral-A1 is a 48" RCP lateral collecting the bulked flow from off-site area A1 and conveying to Line A.
   The Line-A system is to be maintained by RCFCD.

2. Line B – Storm drain Line-B system is a 12' wide x 9' deep rectangular concrete channel, located on north site of the buildings intercept and convey 100-year 1-hour bulked peak flow from off-site Area B. Lateral-B1 consists of 300 LF 60" RCP and 550 LF of 8' wide x 4' deep concrete trap channel. Lateral –B1 conveys the runoffs from subarea B1 and 6.1 acres of on-site self-treated areas to Line-B. The Line-B system is to be maintained by the property owner/ developer.

Table 1-1 below summarizes the proposed storm drain systems in fully developed conditions, 100-year 1-hour off-site flow, on-site flow from self-treated areas and on-site routed flow.

Table 1-1 Summary of Proposed Drainage Facility

AREA A / LINE-A

LOCATION/ AREA		OFF-SITE		ON-SITE DMA B		ON-SITE DMA A		EXIT POINT

BULKED	1.4	256.5	521.8	245.7				

Development Impact

To minimize the increase of the runoffs due to the site development, two on-site Extended Detention Basins are proposed for water quality treatment and hydro-modification. See On-Site Drainage Report for the detailed basin design and calculations. The summary of the on-site unit hydrograph studies and basin routings are attached below for quick reference.

DMA A, WEST EXTENDED DETENTION BASIN
Total treated areas =43.3 Acres, Building #1 and areas west of "A" Street

		EXISTING		PROPOSED		ROUTED	
		Unit Hydrograph		Unit Hydrograph		Basin Routing	
STORM	DURATION	Peak Flow	Total Volume	Peak Flow	Total Volume	Routed Peak	Basin Volume
YEAR	HOUR	CFS	Ac-Ft	CFS	Ac-Ft	CFS	Ac.Ft.
2	24	3.9	1.0	10.8	5.5	3.8	3.5
10	1	72.6	2.6	96.6	2.8	2.2	2.7

100	1			204.9	6.2	9.5	5.8
100	3			115.0	9.9	25.6	8.4
100	6			106.1	13.8	40.5	10.3
100	24			53.9	27.1	38.7	10.1

Even though the mitigation for 100-year storm event is not required, our studies show that the proposed development with its drainage and detention facilities will not cause the advert impact to the downstream properties. See Table 1-2 for the results of pre and post developed condition runoffs.

The sum of developed peak flow 1,727.1 CFS is slightly less than the undeveloped conditions (1,734.6 CFS) for the 100-year storm event. However, there is approximate 130 CFS diversion from Area A to B on developed conditions. Since the two watersheds merge together soon after exit the project site, a letter of acceptance of the flow by the downstream property owner will be adequate to address this minor diversion (As agreed per meeting with RCFCD dated October 23, 2014).

Table 1-2 Summary of Existing and Developed Condition

		EXISTING CONDITIONS			DEVELOPED CONDITIONS			DELTA*
SUB-AREA		A	B	TOTAL	A	B	TOTAL	D-E

STORM YEAR	DURATION HOUR	Peak Flow CFS	Peak Flow CFS	Peak Flow CFS	Peak Flow CFS	Peak Flow CFS	Peak Flow CFS	Peak Flow CFS
10	1	739.7	359.4	1099.1	641.8	448.0	1089.8	-9.3
100	1	1171.4	563.2	1734.6	1029.7	697.4	1727.1	-7.5

Proposed Post Construction BMP's

The proposed post construction water quality management plan may include, but may not be limited to the following measures:

- Public education programs
- Scheduled street sweeping
- Catch basin stenciling
- Landscaping and Erosion Control Landscaping
- Street landscaping
- Slope planting
- Drainage system maintenance and debris removal
- Extended Detention Basins

During the entitlement process, the potential and expected pollutants as well as the pollutants of concern were defined per the Preliminary WQMP. LID BMPs (Extended Detention Basins) are incorporated for the post-developed water quality and hydro-modification mitigations.

Methodology

Civil Design Version 7.0 Computer Software Program was utilized for Riverside County Rational Method calculations and Synthetic Unit Hydrograph Method study to determine on-site and off-site flows for 10-year and 100-year storm.
WSPG Version 14.06 was used in generating the hydraulic analysis for this report.

Conclusion

Based upon the results of this report, it is concluded that the proposed facilities will adequately provide drainage conveyance for the ultimate design capacity. The proposed facilities, with ultimate development and adequate maintenance, will convey flows safely through the site in accordance with Riverside County Requirements.

Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 100.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Beaumont] area used.
10 year storm 10 minute intensity = 2.300(In/Hr)
10 year storm 60 minute intensity = 0.890(In/Hr)
100 year storm 10 minute intensity = 3.410(In/Hr)
100 year storm 60 minute intensity = 1.320(In/Hr)

Storm event year = 100.0
Calculated rainfall intensity data:
1 hour intensity = 1.320(In/Hr)
Slope of intensity duration curve = 0.5300

++

Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 10.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Beaumont] area used.
10 year storm 10 minute intensity = 2.300(In/Hr)
10 year storm 60 minute intensity = 0.890(In/Hr)
100 year storm 10 minute intensity = 3.410(In/Hr)
100 year storm 60 minute intensity = 1.320(In/Hr)

Storm event year = 10.0
Calculated rainfall intensity data:

Program License Serial Number 4010

Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 100.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Beaumont] area used.
10 year storm 10 minute intensity = 2.300(In/Hr)
10 year storm 60 minute intensity = 0.890(In/Hr)
100 year storm 10 minute intensity = 3.410(In/Hr)
100 year storm 60 minute intensity = 1.320(In/Hr)

Storm event year = 100.0
Calculated rainfall intensity data:
1 hour intensity = 1.320(In/Hr)
Slope of intensity duration curve = 0.5300

++

Process from Point/Station 31.000 to Point/Station 32.000
**** INITIAL AREA EVALUATION ****

Initial area flow distance = 605.000(Ft.)
Top (of initial area) elevation = 2824.000(Ft.)
Bottom (of initial area) elevation = 2655.000(Ft.)
Difference in elevation = 169.000(Ft.)
Slope = 0.27934 s(percent)= 27.93
TC = k(0.530)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration = 8.866 min.
Rainfall intensity = 3.637(In/Hr) for a 100.0 year storm
UNDEVELOPED (poor cover) subarea
Runoff Coefficient = 0.861
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.000
Decimal fraction soil group D = 1.000
RI index for soil(AMC 2) = 89.00
Pervious area fraction = 1.000; Impervious fraction = 0.000
Initial subarea runoff = 11.929(CFS)
Total initial stream area = 3.810(Ac.)
Pervious area fraction = 1.000

++

Process from Point/Station 32.000 to Point/Station 33.000
**** NATURAL CHANNEL TIME + SUBAREA FLOW ADDITION ****

```
Top of natural channel elevation =   2655.000(Ft.)
End of natural channel elevation =   2605.000(Ft.)
Length of natural channel  =   508.000(Ft.)
Estimated mean flow rate at midpoint of channel =     20.430(CFS)

Natural valley channel type used
L.A. County flood control district formula for channel velocity:
 Velocity(ft/s) = (7 + 8(q(English Units)^.352)(slope^0.5)
Velocity using mean channel flow =   9.45(Ft/s)

Correction to map slope used on extremely rugged channels with
drops and waterfalls (Plate D-6.2)
       Normal channel slope =  0.0984
Corrected/adjusted channel slope =  0.0984
Travel time =    0.90 min.     TC =    9.76  min.

 Adding area flow to channel
UNDEVELOPED (poor cover) subarea
Runoff Coefficient = 0.859
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 0.000
Decimal fraction soil group D = 1.000
RI index for soil(AMC 2)  =  89.00
Pervious area fraction =  1.000; Impervious fraction =  0.000
Rainfall intensity =      3.456(In/Hr) for a   100.0 year storm
Subarea runoff =     16.119(CFS) for      5.430(Ac.)
Total runoff =     28.048(CFS)        Total area =       9.240(Ac.)

Rational Method Hydrology Program based on
Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 100.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Beaumont] area used.
10 year storm 10 minute intensity = 2.300(In/Hr)
10 year storm 60 minute intensity = 0.890(In/Hr)
100 year storm 10 minute intensity = 3.410(In/Hr)
100 year storm 60 minute intensity = 1.320(In/Hr)

Storm event year = 100.0
Calculated rainfall intensity data:
1 hour intensity = 1.320(In/Hr)
Slope of intensity duration curve = 0.5300

++

Process from Point/Station 81.000 to Point/Station 82.000

Process from Point/Station       89.100 to Point/Station       89.000
**** CONFLUENCE OF MINOR STREAMS ****
________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =     43.300(Ac.)
Runoff from this stream =      9.900(CFS)
Time of concentration =   42.46 min.
Rainfall intensity =     1.586(In/Hr)
Summary of stream data:

Stream   Flow rate      TC            Rainfall Intensity
 No.       (CFS)       (min)                (In/Hr)

1     1019.849     43.00                1.575
2        9.900     42.46                1.586
Largest stream flow has longer time of concentration
Qp =   1019.849 + sum of
```

```
          Qb         Ia/Ib
           9.900 *    0.993 =      9.833
Qp =   1029.682

Total of 2 streams to confluence:
Flow rates before confluence point:
    1019.849       9.900
Area of streams before confluence:
      775.510       43.300
Results of confluence:
Total flow rate =   1029.682(CFS)
Time of concentration =    43.003 min.
Effective stream area after confluence =    818.810(Ac.)

Riverside County Flood Control & Water Conservation District
1978 hydrology manual

Storm event (year) = 100.00 Antecedent Moisture Condition = 2

Standard intensity-duration curves data (Plate D-4.1)
For the [Beaumont] area used.
10 year storm 10 minute intensity = 2.300(In/Hr)
10 year storm 60 minute intensity = 0.890(In/Hr)
100 year storm 10 minute intensity = 3.410(In/Hr)
100 year storm 60 minute intensity = 1.320(In/Hr)

Storm event year = 100.0
Calculated rainfall intensity data:
1 hour intensity = 1.320(In/Hr)
Slope of intensity duration curve = 0.5300

++
