Agency Notice of Preparation of an Draft Environmental Impact Report

DATE: April 24, 2013

TO: Responsible Agencies
Organizations
Interested Parties

PROJECT CASE NO./TITLE: Project Title: I-10 Gateway Center Project

Case Numbers:
- General Plan Amendment No. 1079
- Change of Zone No. 7799
- Parcel Map No. 36564
- Plot Plan No. 25337
- Environmental Impact Report No. 534

A descrption of each application is listed below
General Plan Amendment (GPA1079) – proposes to change the current General Plan Land Use designation from Community Development: Very Low Density Residential and Rural: Rural Mountainous to Community Development: Light Industrial and Rural: Rural Mountainous

Change of Zone (CZ7799) – proposes to change the existing zoning from Controlled Development Areas to Industrial Park and Controlled Development Areas

Parcel Map (PM36564) – proposes to subdivide 228 gross acres into five industrial parcels.

Plot Plan (PP25337) – proposes to construct an industrial distribution facility consisting of two industrial buildings totaling 2,560,000 square feet, with 428 bay doors, located on 230 gross acres, of which approximately 144 acres would be developed as part of the project.

Environmental Impact Report No. 534 – provides an environmental analysis of the potential impacts of the proposed project. The Environmental Issues section below provides additional detail regarding enviornmental issues that will be addressed in the Draft Environmental Impact Report.

PROJECT LOCATION:
The proposed I-10 Gateway Center Project (Project) is located in Township 2 south, Range 1 west, Section 30, along the north side of Cherry Valley Boulevard and east of the Interstate 10 Freeway (I-10), between the Cities of Calimesa and Beaumont, in the unincorporated area of Riverside County, California (See Exhibit 1, Regional Location Map and Exhibit 2, Local Vicinity Map). The Project site has

regional access via Cherry Valley Boulevard to the I-10 Freeway, and local access via Cherry Valley Boulevard, Brookside Avenue, and Oak Valley Parkway.

The Project site, which comprises approximately 230 acres, is vacant and is located within the unincorporated community of Cherry Valley. The City of Beaumont is located south of the Project site, the City of Calimesa is located directly west and northwest of the site and the City of Yucaipa is located approximately two miles north of the site. Access to the site is off Cherry Valley Boulevard. The Assessor Parcel Numbers for the Project site are 407-220-004, 407-220-007, 407-220-008, 407-220-009, 407-220-014, 407-220-016, and 407-220-017. APNs 413-270-012 and 413-270-13 are off-site improvement areas where grading will occur, therefore this area is being analyzed in the environmental review of the proposed project.

PROJECT DESCRIPTION:
The I-10 Gateway Center Project site totals approximately 230 gross acres, of which approximately 144 acres would be included within the developed portion of the Project. The remaining 86 acres would remain as natural open space (approximately 37 percent of the Project site). The Project consists of two (2) industrial buildings will have sizes of approximately 960,000 square feet and 1,600,000 square feet for a total of approximately 2,560,000 square feet of floor area.

The Project site plan is depicted on Exhibit 3. Both buildings are intended to house a variety of industrial uses including some that would be considered “high cube” type wholesale distribution users. The buildings are speculative in that there are not assoicated tenatnts at this time. Both buildings would be approximately 39 feet in height. Three access points are proposed off Cherry Valley Blvd. The primary access point will be located in the mid-portion of the Project site between the two buildings and is proposed as a signalized intersection.

Project mass grading activities would involve onsite cut of 6 million cubic yards and fill of approximately 6 million cubic yards. However the site will balance and no import or export of soils will be needed. Additional off-site grading on the west side of the site, within the City of Calimesa, will be also be needed to implement the Project. Water and sewer service for the Project will be provided by the Yucaipa Valley Water District (YVWD). In order to provide service to the Project site the construction of off-site water and sewer lines in Cherry Valley Boulevard and Calimesa Boulevard, as well as the construction of an off-site water reservoir will also be needed, although it is expected that the reservoir, which has already been designed and funded by YVWD, will be constructed and in place prior to completion of this Project.

There are three ephemeral drainages that traverse the Project site from east to west and northeast to southwest. Although all on-site drainages are ephemeral and do not support wetland vegetation, there are some limited areas of the Project site that contain Waters of the U.S. and Waters of the State. Therefore implementation of the Project may require securing a Federal Section 404 permit and a State Section 1602 Streambed Alteration Agreement.

Land use approvals needed to implement the Project are a Plot Plan Approval and a Tentative Parcel Map. A General Plan Amendment and Zone Change would also be needed. According to the County of Riverside General Plan, the Project site is currently designated as Rural Mountainous (RM) and Very Low Density Residential (VLDR) and is located within the Cherry Valley Gateway Policy Area. The RM designation is located along the northerly portion of the Project site with the majority of the site designated as VLDR. Thus, a General Plan Amendment application to change the Land Use designation from VLDR to Light Industrial (LI) is proposed as part of the Project entitlements. The applicant is requesting to remove the project from the Cherry Valley Gateway Policy Area, in addition to the changes in land use designation. The Project also includes a Change of Zone from Controlled Development (W-2) to Industrial Park (I-P) to be consistent with the General Plan Amendment. The

northern portion of the Project site designated as RM will remain designated as RM, and will not be developed as part of this Project.

Environmental Issues: CEQA Guidelines section 15063 provides that if a Lead Agency determines that an EIR will clearly be required for a project, an Initial Study is not required. The EIR that will be prepared for the proposed Project is a full scope EIR including all of the CEQA Guidelines Appendix G topical issue areas. Potential impacts associated with environmental resource areas that will be analyzed in the EIR include those listed below. A full scope EIR is proposed, so there are no environmental topcis that have been screened out or that are potentilaly less than significant.

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology/Water Quality
- Land Use/Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation/Traffic
- Utilities/Service Systems

The EIR will address the short-term and long-term effects of the Project on the environment. The EIR will also evaluate the potential for the Project to cause direct and indirect growth-inducing impacts, as well as cumulative impacts. Alternatives to the proposed Project that may reduce impacts determined to be significant in the EIR will be evaluated. Mitigation measures will be proposed for those impacts that are determined to be significant. A mitigation monitoring program will also be developed as required by Section 15097 of the California Environmental Quality Act (CEQA) Guidelines.

The environmental determination in this Notice of Preparation is subject to a 30-day public review period pursuant to California Public Resources Code Section 21080.4 and CEQA Guidelines Section 15082. Public agencies, interested organizations, and individuals have the opportunity to comment on the environmental issues that have the potential to be affected by the Project and, therefore, should be addressed in the EIR.

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Carolyn Syms Luna
Director

Pursuant to Riverside County Rules to Implement the California Environmental Quality Act, notice is given to responsible and interested agencies, that the Riverside County Planning Department plans to oversee the preparation on an Environmental Impact Report for the above-described project. The purpose of this notice is to solicit guidance from your agency as to the scope and content of the environmental information to be included in the EIR. Information in that regard should be submitted to this office as soon as possible, but **not later than thirty (30) days** after receiving this notice.

Attached is a copy of the issues to be included in the draft EIR. If you have any questions please contact Paul Rull, Project Planner at 951-955-0972

Sincerely,

RIVERSIDE COUNTY PLANNING DEPARTMENT

A.2 - Scoping Comments April 2013

THIS PAGE INTENTIONALLY LEFT BLANK

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Memorandum

DATE: April 22, 2013

TO: EIR Consultant: MBA

FROM: Paul Rull, Project Manager

RE: **April 22, 2013 Director Hearing meeting for Agenda Item 3.1: Scoping Session for Environmental Impact report No. 534**

The following public comments were raised during the scoping session meeting that was held on April 22, 2013:

Name	Contact	Position	Comment
Susan Pratt	10711 Fabian Lane, Cherry Valley CA 92223	Opposed	Project not consistent with rural community. Concerns with traffic, noise, air quality, land use compatibility, hazardous materials, water quality. Referenced nearby residential planned community that incorporated rural elements into the project design.
Jerry Guarracino	City of Calimesa	Neutral	Job creation is a benefit. Concerned with traffic to Cherry Valley Blvd and Singleton Road. Would like to know more information on timing of improvements. The EIR should identify the project's impact on maintenance and cost of services i.e. police, fire, road maintenance. Protection of dark skies and rural area. Two residential projects (Osborne+Holbert) west of the I-10 Gateway center; concerned about how those projects take access through the I-10 Gateway project. EIR should identify environmental justice with jobs created from the project going to the surrounding local residents.

In addition, several comments were received by the Planning Department during the noticing of the project's scoping session and they are as follows:

From: composerx [composerx@verizon.net] Sent: Mon 4/22/2013 6:59 AM
To: Rull, Paul
Cc:
Subject: cherry valley

There is absolutely NO resident living in cherry valley that will put up with this gateway project .. This is a rural , horse riding , quiet area that will not tolerate any giant industrial complex placed here . Put this project in an area that is defined for industrial buildings. This is not the proper place for this and residents will fight this as they have fought to keep this area rural for 40 yrs.
Hundreds of trucks coming in and out of cherry valley blvd. is absolutely absurd . There is a future housing development that will be going in across the street from this . They will not put up with this being across the street . Nobody will buy a house having to look at this monster . There is also no water for any project of this size .

Subject: Gateway Center

The proposed Gateway Center development is not compatible with the residential/rural community of Cherry Valley.

2.5 million square feet = **57 acres under roof !** A development of this size will adversely impact the traffic, pollute the air, create an eyesore and, last but not least, will crush property values.

Hello,

My name is Adam Sampson. I am a retired US Army veteran who is moving into the Cherry Valley area in June of this year. I just read about the 2.5 million sq ft industrial building that is being considered about 2 miles away from my home that I am the owner of. I must first say I believe this will make the area look horrible. My family and I want to make our home in a clean and waste free area and Cherry Valley/Beaumont is where we believed to be the place we could raise our 6, 4, 2 year old children for years to come. I must say that something of this size right next to a freeway would take away from the rural environment that I want as a homeowner.

I understand that the city and county would like to make money to help the city thrive but this looks like a really dumb idea and I couldn't see any high paying jobs coming from it. Most likely a bunch of 10-12 dollar an hour jobs to help keep the community in borderline poverty. I want more from the elected officials in Riverside county and the city of Beaumont. I have not read good things about the way they act in the community towards other elected officials, such as the pissing contest they all got into during the November 2012 elections.

I, for one, will most likely sell my home before I can live 5 years in it if this thing is erected so close to the freeway which is going to lead to larger amounts of traffic and pollution from big rigs and whatever that industrial plant might actually be for and who will own and operate it. I will be looking closely into the development of this project, and I will be looking into other areas that are near Newport Beach and cities that already have the pollution problems and traffic problems that are not rural areas because what you're going to be doing is opening up a floodgate to other developers to fill up the rural areas because everything west is already filled up.

Good luck keeping residents and building more homes in this area. I am sure I am not alone. I do hope my comments can be given during your meetings as I encourage you to do so.

Thank you for your time.

Subject: Cherry Valley

Dear Mr Rull,
We live in a peaceful rural area by choice. The reason we live here is because we do not want to live in a busy city or housing development. We garden and eat off our lands, use our area as a park and choose to live a simple country life. By allowing this industrial park in our area you will greatly affect our quality of life. We abide by the 1acre rule with our houses and expect everyone else in Cherry Valley to abide by the rule as well. We are an area with lots of wildlife that will be endangered by this project. We had to have a study for kangaroo rats before we built our home on the land my husband was raised on. We have fought for years to not be annexed by any of the cities around us. In their growth they have hurt our home values, created too much traffic, ruined our schools with gangs, crime has gone up and pollution and trash have come our way.
Surely you can find another area that will welcome the tax revenue. Please kindly forget about our quaint little are as there are not many left in Southern California.

Respectively, Dusty and Melissa Hanvey

Subject: I-10 Gateway Center

Hello Mr. Paul Rull,

I could not make it to the mid-day meeting but I would like to express my concerns regarding the I-10 Gateway Center.

Presently, the I-10 Freeway exchange at Cherry Valley Blvd. is not able to handle the proposed heavy truck traffic. I am also concerned that the heavy truck traffic will adversly efffect our air quality.

Would the center be connected to a sewer system or use septic tanks? There is justifiable concern in Cherry Valley about high nitrates in our ground water.

Aside from obvious benefit of new jobs, I don't see how the Gateway Center would be beneficial to a residential community like Cherry Valley. Residents here, like myself, want to maintain the ruralness and open spaces. The idea of building a massive industrial complex on 230 acres next to the entrance to this beautiful open space community would be a bad idea and could adversely affect our property values.

Respectfully,

Jeff Elser

Subject: Cherry Valley

Seriously... You really need to stay out of Cherry Valley with your Industrial development. It is disgusting that you have to cover every piece of open land you can find with more buildings and houses and ruin everything. Enough is enough and I can guarantee that all of us in Cherry Valley are going to fight it tooth and nail.
My family and I have been here since the early 1940's and I have already seen enough damage to this whole area. I'll be damned if I sit back and watch you and the planning dept come in and trash it more.

Sincerely,

Seleste Dunn(Sabatino)

Subject: Cherry Valley warehouse project

Mr. Rull,

My family is against this proposed warehouse project 100%. Cherry Valley Blvd is the main road in and out of our area, and this kind of building would have destructive impacts on our traffic and environment. It would be akin to causing all residents of Ontario to have to drive through one of their industrial complexes every single time they needed to go out on the freeway. The open space and rolling hills of the Blvd that one is treated to once off the freeway is unique, and is the reason many people chose this area to live in. Building giant warehouses in that area will change our entire way of life, ruining the unspoiled view that makes this our home.

The California Employment Development Department reports that these warehouse complexes bring no real benefit for a community; on the contrary, the jobs they offer are mostly low paying and without benefits. This is a rural area with orchards and horse property, with older citizens and established families. The type of job opportunities these warehouses offer will hold no attraction to the local population. The judgement to then build them here rather than in an area where there is a populace that would embrace the level of employment they offer is deeply flawed. We will only end up with the traffic, air, and sight pollution from this project, which will lower our property values, driving out existing homeowners and attracting a poorer subset of residents.

This is not what I expect from Riverside County Supervisors. They have lost the capacity to see that they are now willing to destroy their constituents' quality of life in exchange for a substandard money making opportunity, which will do more long term damage to the area they represent than the economy ever could. If this project passes, I will not have to worry very long about voting Mr. Ashley out of office; only for as long as it takes to sell my home. That is, IF anyone will want to buy it knowing that these warehouses are going to be built nearby. Please record my family's very vocal NO into your collection of resident feedback on this project.

Subject: Report No. 534 - Gateway center

Mr. Rull:
My name is Patsy Reeley. I am President of Cherry Valley Acres & Neighbors (CVAN), an organization that represents over 300 families in Cherry Valley that are concerned with keeping the area rural.
The proposed Gateway Center is NOT something that would be fitting for the ?gateway? to the Community of Cherry Valley for the following reasons:
? The freeway interchange is not adequate for the amount of truck traffic this project will produce ? The emissions from the trucks will greatly effect the quality of our air ? Over 2 million sq.ft. of box buildings do not belong in a residential area!
? The Project is in a flood zone
? The Project does not benefit the residents of Calimasa or Cherry Valley ? This Project would decrease the value of surrounding residential homes The City of Beaumont welcomes this type venture and there is land available off the 60 Highway for projects such as this.

Subject: Cherry Valley Industrial Center Project Comment

Dear Mr. Rull -

According to the PE Article, this is simply in the exploratory phase, but not too early to emphasize that any development of the land east of the I-10 Freeway on Cherry Valley Blvd will, and foremost, require a complete redesign and overall of the I-10/Cherry Valley Blvd freeway overpass (on ramps/off-ramps) to handle any resulting increase in traffic (especially truck traffic as the location of stop signs/lack of signal controls, length of off-ramps, width of Cherry Valley Blvd. is not conducive with slow moving, lane-hogging trucks).

Your challenge will be made difficult by much of this area being City of Calimesa, with influence on the City of Beaumont, and CalTrans. This overpass has been a death trap ever since they allowed for the Fairway Canyon development west of the I-10 Freeway without requiring an upgrade to this freeway overpass. Its an absolute mess with Calimesa Blvd intersecting Cherry Valley Blvd just east of the Freeway, and Roberts Rd., intersecting Cherry Valley Blvd just west of the Freeway, with no signal controls so trying to exit either direction off of the I-10 Freeway or cross the overpass at peak traffic hours is like trying to play the game "Frogger." You take your life into your hands. My daughter was broad-sided and injured by a driver exiting the freeway who did not understand that cross traffic did not have to stop a second time at the freeway on/off ramp (after stopping at Roberts Rd) and was nearly broad-sided again last week. East bound traffic over the overpass traveling at speed makes it nearly impossible to look left, look right, look left and then turn left without getting hit as you try to turn left from the northbound exit of the I-10 Freeway at Cherry Valley Blvd. That is because in the time it takes to look all directions traffic that is not initially visible, appear at the crest of the overpass traveling at speed, and drivers exiting have a fraction of a second to stop before pulling out from a dead stop. I have had numerous near misses and there have been countless accidents.

In short, we're in need of an overhaul of this overpass now! There is no way that this consideration could not be number one priority if evaluating any development of the land east of the freeway that would bring any additional traffic to the area. Unfortunately all parties involved (Calimesa, Caltrans and Beaumont) have all waited for a development to come along to pay for it while local residents who are some of the highest taxed in the county (2.2%) are made to suffer.

Thanks for listening...

Regards,

Ross K

Re: Comments – I-10 Gateway Job Center (Warehouse/Distribution Complex)– Case #PP25337 - General Plan Amend. No. 1079, Change of Zone No. 7799, Parcel Map No. 36564, Plot Plan No. 25337

Dear Paul Rull:

The City of Beaumont has reviewed the site plan exhibit for the **I-10 Gateway Job Center – Case #PP25337**, and the City supports projects that generate economic activity, such as this proposal; however, the City is concerned that the proposed two-building distribution/warehouse complex would not be a compatible use for this area.

To the south of the proposal, currently there is the approved Sunny-Cal Specific Plan, which would be directly across the street from this proposal. The Sunny-Cal Specific Plan was approved for 560 Single-Family Homes, with a minimum of 20,000 Square Foot Lots, on the lots that are adjacent to Cherry Valley Blvd, across from this project. Conceivable incompatibilities could include issues relating to noise, traffic, air quality, road circulation, etc.

Additionally, the character of Cherry Valley is rural residential in nature and this proposal would be an isolated industrial park, with no similar projects adjacent too, or within the vicinity of this proposal. It seems that this use could be classified as "Spot Zoning", which is generally not a recommended land use practice.

Lastly, there was no discussion, within the transmittal, of what type of Environmental Analysis has been completed so far, if at all, in relation to the proposal. The City of Beaumont would like to review this document when available.

Thank you for the opportunity to comment on this proposed project. If you have any further questions regarding the above mention item, please feel free to contact us here at the Planning Department at (951) 769-8518.

Sincerely,

Chris Tracy, AICP

SOBOBA BAND OF LUISEÑO INDIANS
EST. JUNE 19, 1883

Re: I-10 Gateway Center, EIR 534

The Soboba Band of Luiseño Indians appreciates your observance of Tribal Cultural Resources and their preservation in your project. The information provided to us on said project has been assessed through our Cultural Resource Department, where it was concluded that although it is outside the existing reservation, the project area does fall within the bounds of our Luiseño Tribal Traditional Use Areas.

Soboba Band of Luiseño Indians is requesting the following:

1. To initiate a consultation with the Project Developer and Land owner.

2. The transfer of information to the Soboba Band of Luiseno Indians regarding the progress of this project should be done as soon as new developments occur.

3. Soboba Band of Luiseño Indians continues to act as a consulting tribal entity for this project.

4. Working in and around traditional use areas intensifies the possibility of encountering cultural resources during the construction/excavation phase. For this reason the Soboba Band of Luiseño Indians requests that Native American Monitor(s) from the Soboba Band of Luiseño Indians Cultural Resource Department to be present during any ground disturbing proceedings. Including surveys and archaeological testing.

5. Request that proper procedures be taken and requests of the tribe be honored (Please see the attachment)

Sincerely,

Joseph Ontiveros
Director of Cultural Resources

COUNTY OF RIVERSIDE

Cultural Items (Artifacts). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer should agree to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

The Developer should waive any and all claims to ownership of Native American ceremonial and cultural artifacts that may be found on the Project site. Upon completion of authorized and mandatory archeological analysis, the Developer should return said artifacts to the Soboba Band within a reasonable time period agreed to by the Parties and not to exceed (30) days from the initial recovery of the items.

Treatment and Disposition of Remains.

A. The Soboba Band shall be allowed, under California Public Resources Code § 5097.98 (a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity.

B. The Soboba Band, as MLD, shall complete its inspection within twenty-four (24) hours of receiving notification from either the Developer or the NAHC, as required by California Public Resources Code § 5097.98 (a). The Parties agree to discuss in good faith what constitutes "appropriate dignity" as that term is used in the applicable statutes.

C. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code § 5097.98 (a) and (b). The Soboba Band, as the MLD in consultation with the Developer, shall make the final discretionary determination regarding the appropriate disposition and treatment of human remains.

D. All parties are aware that the Soboba Band may wish to rebury the human remains and associated ceremonial and cultural items (artifacts) on or near, the site of their discovery, in an area that shall not be subject to future subsurface disturbances. The Developer should accommodate on-site reburial in a location mutually agreed upon by the Parties.

E. The term "human remains" encompasses more than human bones because the Soboba Band's traditions periodically necessitated the ceremonial burning of human remains. Grave goods are those artifacts associated with any human remains. These items, and other funerary remnants and their ashes are to be treated in the same manner as human bone fragments or bones that remain intact

Coordination with County Coroner's Office. The Lead Agencies and the Developer should immediately contact both the Coroner and the Soboba Band in the event that any human remains are discovered during implementation of the Project. If the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner shall ensure that notification is provided to the NAHC within twenty-four (24) hours of the determination, as required by California Health and Safety Code § 7050.5 (c).

Non-Disclosure of Location Reburials. It is understood by all parties that unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and shall not be governed by public disclosure requirements of the California Public Records Act. The Coroner, parties, and Lead Agencies, will be asked to withhold public disclosure information related to such reburial, pursuant to the specific exemption set forth in California Government Code § 6254 (r).

Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer agrees to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

A.3 - Notice of Preparation (NOP) January 2014

THIS PAGE INTENTIONALLY LEFT BLANK

RIVERSIDE COUNTY
PLANNING DEPARTMENT

Carolyn Syms Luna
Director

Agency Notice of Preparation of a Draft Environmental Impact Report

DATE: January 6, 2013

TO: Responsible Agencies
Organizations
Interested Parties

PROJECT CASE NO./TITLE: Project Title: I-10 Gateway Center Project

Case Numbers:
- General Plan Amendment No. 1079
- Change of Zone No. 7799
- Parcel Map No. 36564
- Plot Plan No. 25337
- Environmental Impact Report No. 534

A description of each application is listed below:

General Plan Amendment (GPA1079) – proposes to change the current General Plan Land Use designation from Community Development: Very Low Density Residential (CD: VLDR) and Rural: Rural Mountainous (R: RM) to Community Development: Light Industrial (CD: LI) and Rural: Rural Mountainous (R: RM). In addition, the proposed project would require this General Plan amendment to adjust the boundary of the Cherry Valley Gateway Policy Area because the applicant is requesting to remove the project from the Cherry Valley Gateway Policy Area.

Change of Zone (CZ7799) – proposes to change the existing zoning from Controlled Development Areas (W-2) to Industrial Park (I-P).

Parcel Map (PM36564) – proposes to create three industrial parcels.

Plot Plan (PP25337) – proposes to construct an industrial distribution facility consisting of two industrial buildings totaling 2,560,000 square feet, with 428 bay doors.

Environmental Impact Report No. 534 – provides an environmental analysis of the potential impacts of the proposed project. The Environmental Issues section below provides additional detail regarding enviornmental issues that will be addressed in the Draft Environmental Impact Report.

PROJECT LOCATION:
The proposed I-10 Gateway Center project (project) is located in Township 2 south, Range 1 west, Section 30, along the north side of Cherry Valley Boulevard and east of the Interstate 10 Freeway (I-10), between the Cities of Calimesa and Beaumont, in the unincorporated area of Riverside County, California (see Exhibit 1 and Exhibit 2). The project has regional access via Cherry Valley Boulevard to the I-10 Freeway, and local access via Cherry Valley Boulevard, Brookside Avenue, and Oak Valley Parkway.

The project, which comprises approximately 246.5 acres, is vacant and is generally located within the Riverside County unincorporated community of Cherry Valley. Approximately 16.5 acres of the western portion of the project is located within the City of Calimesa, although no buildiings would be constructed in this area. As depicted on Exhibit 2, the City of Beaumont is located south of the project, the City of Calimesa is located directly west and northwest of the site. The City of Yucaipa is located approximately two miles north of the site. Access to the site is off Cherry Valley Boulevard. The Assessor Parcel Numbers for the project are 407-220-004, 407-220-007, 407-220-008, 407-220-009, 407-220-014, 407-220-016, 413-270-012, 413-270-013, and 407-220-017.

PROJECT DESCRIPTION:
Approximately 171.1 acres of the 246.5 acre project would be included within the developed portion of the project. The remaining 74.8 acres would remain as open space (approximately 30.3 percent of the project). The project consists of two (2) industrial buildings that will have sizes of approximately 960,000 square feet and 1,600,000 square feet for a total of approximately 2,560,000 square feet of floor area.

The project plan is depicted on Exhibit 3. Both buildings are planned as “high-cube” logistics uses for the distribution of goods. Both buildings would be up to approximately 47 feet in height. Three access points are proposed off Cherry Valley Boulevard. The primary access point is proposed as a signalized intersection, and will be located in the mid-portion of the project between Building 1 and Building 2.

Water quality basins and improved drainage channels will be constructed to the west of Building 1. A concrete drainage channel will be located north of Buildings 1 and 2. Additionally, a grouted riprap berm and a water quality infiltration trench will be located north of Building 2. Riprap berms will be located east of Building 2 and two water quality basins are planned south of Buildings 1 and 2, paralleling Cherry Valley Boulevard. Additionally, a concrete drainage channel will be located south of the water quality basins and north of Cherry Valley Boulevard.

Existing drainage flows from offsite areas to the north and east of the project, as well as runoff from the undeveloped portions of the site, would be conveyed through the site in concrete drainage channels and conveyed offsite on the west side of the property. Onsite runoff will be treated in the water quality infiltration trench located north of Building 2 and in two water quality basins located on the south side of the project.

Water and sewer service for the project will be provided by the Yucaipa Valley Water District (YVWD). In order to provide service to the project, the construction of off-site water and sewer lines in Cherry Valley Boulevard and Calimesa Boulevard will be needed. The project is currently outside the boundaries of the YVWD; therefore, an application for annexation into the YVWD will be filed with the San Bernardino County Local Agency Formation Commission (LAFCO). Two water storage reservoirs, each with a one million gallon capacity, are proposed as part of the project on the northeastern portion of the project. One of the reservoirs will be used for reclaimed water storage and one reservoir will be used for potable water storage.

Project grading activities would involve onsite cut of approximately 6 million cubic yards (cy) and fill of approximately 6 million cy. The site is designed for an earthwork balance and no import or export of soils

will be needed. Limited off-site improvements will be needed along the east boundary of the project for grading and drainage improvements, as well as access right-of-way.

There are three ephemeral drainages that traverse the project from east to west and northeast to southwest. Ephemeral drainages are drainages with water flows that generally occur for only a short period after a rain event. Although all on-site drainages are ephemeral and do not support wetland vegetation, there are some limited areas of the project that contain Waters of the U.S. and Waters of the State. Therefore implementation of the project would require securing a Federal Section 404 permit and a State Section 1602 Streambed Alteration Agreement.

Land use approvals needed to implement the project include: a Plot Plan; a Tentative Parcel Map; a zone change; and two General Plan Amendments. According to the County of Riverside General Plan, the project is currently designated as Very Low Density Residential (VLDR), and Rural Mountainous (RM) along the northern, steeper portion of the site. A General Plan Amendment is proposed to change the Land Use designation from VLDR to Light Industrial (LI) for approximately 155.2 acres. The General Plan land use designation for the 16.5 acres located within the City of Calimesa, which is Rural Living (RL), would not be changed, nor would the VLDR & RM designations for the 74.8 acres that would remain as open space. The applicant is also requesting a General Plan Amendment to remove the project from the Cherry Valley Gateway Policy Area.

The project also includes a Change of Zone from Controlled Development (W-2) to Industrial Park (I-P) to be consistent with the General Plan Amendment for the 155.2 acre to be designated LI. The northern portion of the project that would remain as open space would remain zoned W-2, and the current zoning for that portion of the project within theh City of Calimesa would remain RL.

ENVIRONMENTAL ISSUES:
CEQA Guidelines section 15063 provides that if a Lead Agency determines that an EIR will clearly be required for a project, an Initial Study is not required. The EIR that will be prepared for the proposed project is a full scope EIR including all of the CEQA Guidelines Appendix G topical issue areas. Potential impacts associated with environmental resource areas that will be analyzed in the EIR include those listed below. A full scope EIR is proposed, so there are no environmental topics that have been screened out from reivew in the Draft EIR.

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology/Water Quality
- Land Use/Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation/Traffic
- Utilities/Service Systems

The EIR will address the short-term and long-term effects of the project on the environment. The EIR will also evaluate the potential for the project to cause direct and indirect growth-inducing impacts, as well as cumulative impacts. Alternatives to the proposed project that may reduce impacts determined to be significant in the EIR will be evaluated. Mitigation measures will be proposed for those impacts that are determined to be significant. A mitigation monitoring program will also be developed as required by Section 15097 of the California Environmental Quality Act (CEQA) Guidelines.

The environmental determination in this Notice of Preparation is subject to a 30-day public review period pursuant to California Public Resources Code Section 21080.4 and CEQA Guidelines Section 15082. Public agencies, interested organizations, and individuals have the opportunity to comment on the environmental issues that have the potential to be affected by the project and, therefore, should be addressed in the EIR.

LEAD AGENCY:
Riverside County Planning Department
4080 Lemon Street, 12th Floor
P.O. Box 1409
Riverside, CA 92502-1409

Attn: Paul Rull, Project Planner

PROJECT SPONSOR:
Applicant: TSG-Cherry Valley L.P. care of Shopoff Group, L.P.
Contact: Brian Rupp

Address: 2 Park Plaza, Suite 700
Irvine, CA 92614

Pursuant to Riverside County Rules to Implement the California Environmental Quality Act, notice is given to responsible and interested agencies that the Riverside County Planning Department plans to oversee the preparation on an Environmental Impact Report for the above-described project. The purpose of this notice is to solicit guidance from your agency as to the scope and content of the environmental information to be included in the EIR. Information in that regard should be submitted to this office as soon as possible, but **not later than thirty (30) days** after receiving this notice.

If you have any questions, please contact Paul Rull, Project Planner, at 951-955-0972.

Sincerely,

RIVERSIDE COUNTY PLANNING DEPARTMENT
Carolyn Syms Luna, Director

Paul Rull, Project Planner

NOTICE OF SCOPING SESSION

A SCOPING SESSION has been scheduled before the **RIVERSIDE COUNTY PLANNING DIRECTOR** in order to bring together and resolve the concerns of affected federal, state and local agencies, the proponent of the proposed project, and other interested persons; as well as inform the public of the nature and extent of the proposed project indicated below, and to provide an opportunity to identify the range of actions, alternatives, mitigation measures, and significant effects to be analyzed in depth in the EIR and help eliminate from detailed study issues found not to be important.

The Scoping Session is **not** a public hearing on the merit of the proposed project and **NO DECISION** on the project will be made. **Public testimony is limited to identifying issues regarding the project and potential environmental impacts.** The project proponent will not be required to provide an immediate response to any concerns raised. The project proponent will be requested to address any concerns expressed at the Scoping Session, through revisions to the proposed project and/or completion of a Final Environmental Impact Report, prior to the formal public hearing on the proposed project. Mailed notice of the public hearing will be provided to anyone requesting such notification.

ENVIRONMENTAL IMPACT REPORT NO.: **534** STATE CLEARINGHOUSE NO.: **N/A**

PROJECT CASE NO(S). / TITLE: **I-10 Gateway Center,** Applicant: TSG Cherry Valley, LLP. – Fifth/Fifth Supervisorial District.

PROJECT LOCATION: Northerly Cherry Valley Boulevard, easterly of Interstate-10 and westerly Vineland Street – 230.0 Gross Acres.

PROJECT DESCRIPTION:
To construct an industrial distribution facility consisting of two industrial buildings totaling 2,560,000 square feet, with 428 bay doors, located on 246.5 gross acres, of which approximately 171.1 acres would be developed as part of the project. The remaining 74.8 acres would remain as natural open space. The project is made up of the following application types: general plan amendment, change of zone, parcel map, and plot plan.

TIME OF SCOPING SESSION:	1:30 p.m. or as soon as possible thereafter.
DATE OF SCOPING SESSION:	January 27, 2014
PLACE OF SCOPING SESSION:	County Administrative Center 1st Floor, Conference Room 2A Riverside, CA 92501

Please send all written correspondence to:

Re: PROJECT TITLE: I-10 Gateway Center Project

Dear Mr. Rull,

The District received your *Agency Notice of Preparation of a Draft* Environmental Impact Report for the I-10 Gateway Center Project, and has the following information to add:

1. The project is within the attendance boundaries of the following schools:

Impacted School Sites			
Name of School	Design Capacity	Current Enrollment	Planned Expansion
Brookside Elementary	930	603	None
Mountain View Middle School	1350	956	None
Beaumont High School	3660	2369	None

2. The District's most recent Commercial/Industrial Development School Fee Justification Study determined that the average student generation impacts per 1,000 square feet for industrial/warehouse/manufacturing at the for elementary, middle, and high schools as follows:

Average Student Generation Impact per 1,000 square feet for industrial/warehouse/manufacturing		
Grade	Per S/F	Project Impact*
Elementary School Impact	.0337/1000	87
Middle School Impacts	.0165/1000	43
High School Impacts	.0209/1000	54
Total Student Generation Impacts	.0711/1000	184

*based on anticipated 2,560,000 square feet total

3. Although there presently is capacity for additional students at the District's school facilities, the District anticipates, based on information provided by the City of Beaumont, County of Riverside, and others, that such capacity will be insufficient to accommodate expected student growth over the next several years. The pace of home construction in Beaumont Unified School District is expected to increase significantly, as there are many projects in the preliminary and active planning stages waiting approval to start building. The District continues to monitor these projects giving ample time to plan.

4. The District's current rate for school facilities fees levied for commercial projects is 0.51¢ per square foot. Please note that this rate is based on the state statutory rates, and is subject to biennial adjustment by the State Allocation Board. All developers should contact the facilities department to request an appointment to pay school facilities fees.

5. All further questions can be directed to Alice Grundman, Substitute Director of Facilities and Planning at (951)797-5373 (email to agrundman@beaumontusd.k12.ca.us) , or in my absence, questions can be directed Lisa Tarrats, Facilities Accounting Technician at (951) 797-5374 (email to ltarrats@beaumontusd.k12.ca.us).

Please do not hesitate to contact either of us should you have any further questions in this regard.

Sincerely,

Alice Grundman

Interstate-10 Gateway Center Project Parcel Map 36564 Plot Plan 25337 (Riv 10 PM R3.08)

Mr. Rull,

We have completed our initial review for the above mentioned proposal (PM36564) to create three industrial parcels-(PP25337) to construct an industrial distribution facility consisting of two industrial buildings totaling 2,560,000 square feet with 428 bay doors. This project comprises approximately 246.5 acres located within the Riverside County unincorporated community of Cherry Valley.

As the owner and operator of the State Highway System (SHS), it is our responsibility to coordinate and consult with local jurisdictions when proposed development may impact our facilities. As the responsible agency under the California Environmental Quality Act (CEQA), it is also our responsibility to make recommendations to offset associated impacts with the proposed project. Although the project is under the jurisdiction of the County of Riverside due to the Project's potential impact to State facilities it is also subject to the policies and regulations that govern the SHS.

We recommend the following to be provided:

Traffic Study

- A Traffic Impact Study (TIS) is necessary to determine this proposed project's near-term and long-term impacts to the State facilities and to propose appropriate mitigation measures. The study should be based on Caltrans' *Guide for the Preparation of Traffic Impact Studies (TIS)* which is located at the following website:

http://www.dot.ca.gov/hq/tpp/offices/ocp/igr_ceqa_files/tisguide.pdf

Minimum contents of the traffic impact study are listed in Appendix "A" of the TIS guide.

- The data used in the TIS should not be more than 2 years old.

- The geographic area examined in the traffic study should include as a minimum all regionally significant arterial system segments and intersections, including State highway facilities where the project will add over 100 peak hour trips. State highway facilities that are experiencing noticeable delays should be analyzed in the scope of the traffic study for projects that add 50 to 100 peak hour trips.

- Traffic Analysis Scenarios should clearly be exhibited as exiting, existing + project, existing + project + cumulative, and existing + project + cumulative + ambient growth.

- Caltrans endeavors that any direct and cumulative impacts to the State highway system be eliminated or reduced to a level of insignificance pursuant to the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) standards.

  - The LOS for operating State highway facilities is based upon Measures of Effectiveness (MOE) identified in the Highway Capacity Manual (HCM). Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" on State highway facilities; however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than this target LOS, the existing MOE should be maintained. In general, the region-wide goal for an acceptable LOS on all freeways, roadway segments, and intersections is "D". For undeveloped or not densely developed locations, the goal may be to achieve LOS "C".

- Clearly indicate LOS with and without improvements.

  - It is recommended that the Synchro Analysis includes all intersections from the Project site to the proposed study areas. A PHF of 0.92 in urban areas is recommended to be used in the Synchro Analysis.

  - All freeway entrance and exit ramps where a proposed project will add a significant number of peak-hour trips that may cause any traffic queues to exceed storage capacities should be analyzed. If ramp metering is to occur, a ramp queue analysis for all nearby Caltrans metered on-ramps is required to identify the delay to motorists using the on-ramps and the storage necessary to accommodate the queuing. The effects of ramp metering should be analyzed in the traffic study. For metered freeway ramps, LOS does not apply. However, ramp meter delays above 15 minutes are considered excessive.

- Proposed improvements should be exhibited in preliminary drawings that indicate the LOS with improvements.

- **Submit a hard copy of all Traffic Impact Analysis documents and an electronic Synchro Analysis file.**

We appreciate the opportunity to offer comments concerning this project. If you have any questions regarding this letter, please contact Talvin Dennis at (909) 806-3957 or myself at (909) 383-4557 for assistance.

Sincerely,

DANIEL KOPULSKY
Office Chief
Community and Regional Planning

Riverside, CA 92502-1409

Subject: Notice of Preparation for the I-10 Gateway Center Project
Draft Environmental Impact Report
State Clearinghouse No. 2014011009

Dear Mr. Rudd:

The Department of Fish and Wildlife (Department) appreciates the opportunity to comment on the Notice of Preparation (NOP) for the I-10 Gateway Center Project (Project) [State Clearinghouse No. 2014011009]. The Department is responding to the NOP as a Trustee Agency for fish and wildlife resources (California Fish and Game Code Sections 711.7 and 1802, and the California Environmental Quality Act [CEQA] Guidelines Section 15386), and as a Responsible Agency regarding any discretionary actions (CEQA Guidelines Section 15381), such as the issuance of a Lake or Streambed Alteration Agreement (California Fish and Game Code Sections 1600 *et seq.*) and/or a California Endangered Species Act (CESA) Permit for Incidental Take of Endangered, Threatened, and/or Candidate species (California Fish and Game Code Sections 2080 and 2080.1).

Project Description

The Project area encompasses 246.5 acres north of Cherry Boulevard, east of I-10 Freeway, and west of Vineland Street in unincorporated Riverside County. The proposed Project includes the development of 171.1 acres with two industrial buildings, totaling 2,560,000 square feet, and 74.8 acres of open space.

Biological Resources and Impacts

The CEQA document should contain sufficient, specific, and current biological information on the existing habitat and species at the Project site; measures to minimize and avoid sensitive biological resources; and mitigation measures to offset the loss of native flora and fauna and State waters. The CEQA document should not defer impact

analysis and mitigation measures to future regulatory discretionary actions, such as a Lake or Streambed Alteration Agreement.

If state or federal endangered or threatened species have the potential to occur on the Project site, species specific surveys should be conducted using methods approved by the Department or assume the presence of the species throughout the project site. The CEQA document should include recent survey data (CEQA Guidelines Section 15125(a)). The CEQA document should also address species of special concern and federal critical habitat. To assist with review, an accompanying map showing the areas of impact should be included in the subsequent CEQA document. Additional maps detailing the location of endangered, threatened, or special of special concern should also be included in the subsequent CEQA document.

Natural Community Conservation Program (NCCP) and California Endangered Species Act (CESA)

The Department is responsible for ensuring appropriate conservation of fish and wildlife resources including threatened, endangered, and/or candidate plant and animal species, pursuant to the CESA, and administers the Natural Community Conservation Plan Program (NCCP Program). Within the Inland Deserts Region, the Department issued Natural Community Conservation Plan Approval and Take Authorization for the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) per Section 2800, *et seq.*, of the California Fish and Game Code on June 22, 2004. The MSHCP establishes a multiple species conservation program to minimize and mitigate habitat loss and provides for the incidental take of covered species in association with activities covered under the permit.

Compliance with approved habitat plans, such as the MSHCP, is discussed in CEQA. Specifically, Section 15125(d) of the CEQA Guidelines requires that the CEQA document discuss any inconsistencies between a proposed Project and applicable general plans and regional plans, including habitat conservation plans and natural community conservation plans. An assessment of the impacts to the MSHCP as a result of this Project is necessary to address CEQA requirements. To obtain additional information regarding the MSHCP please go to: http://www.rctlma.org/mshcp/.

The proposed Project occurs within the MSHCP area and is subject to the provisions and policies of the MSHCP. In order to be considered a covered activity, Permittees must demonstrate that proposed actions are consistent with the MSHCP and its associated Implementing Agreement. The County of Riverside is the Lead Agency and is signatory to the Implementing Agreement of the MSHCP.

Lake and Streambed Alteration Program

Although the proposed Project is within the MSHCP, a Notification of Lake or Streambed Alteration is still required by the Department, should the site contain jurisdictional waters. Additionally, the Department's criteria for determining the presence of jurisdictional waters are more comprehensive than the MSHCP criteria in Section

6.1.2 (Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools). The Department is responsible for assessing and evaluating impacts to jurisdictional waters; typically accomplished through reviewing jurisdictional delineation (JD) reports, supporting information, and conducting site visits. Following review of a JD, the Department may request changes to the JD. The Department may also recommend that additional project avoidance and/or minimization measures be incorporated, or request additional mitigation for project-related impacts to jurisdictional areas.

The Department recommends submitting a notification early in the project planning process, since modification of the proposed project may be required to avoid or reduce impacts to fish and wildlife resources. To obtain a Lake or Streambed Alteration notification package, please go to http://www.dfg.ca.gov/habcon/1600/forms.html.

The Department opposes the elimination of ephemeral, intermittent, and perennial streams, channels, lakes, and their associated habitats. The Department recommends avoiding stream and riparian habitat to the greatest extent possible. The CEQA document should include measures to avoid or minimize project impacts. Where adverse impacts cannot be avoided or minimized, the CEQA document should describe compensatory mitigation, for example, the creation and/or restoration of in-kind habitat either on- or off-site. Additional mitigation requirements through the Department's Lake and Streambed Alteration Agreement process may be required, depending on the quality of habitat impacted, proposed compensatory mitigation, project design, and other factors.

The following information will be required for the processing of a Notification of Lake or Streambed Alteration and the Department recommends incorporating this information into the CEQA document to avoid subsequent documentation and project delays:

1) Delineation of lakes, streams, and associated habitat that will be temporarily and/or permanently impacted by the proposed project (include an estimate of impact to each habitat type);
2) Discussion of avoidance and minimization measures to reduce project impacts; and,
3) Discussion of potential mitigation measures required to reduce the project impacts to a level of insignificance. Please refer to section 15370 of the CEQA Guidelines for the definition of mitigation.

In the absence of specific mitigation measures in the CEQA document, the Department believes that it cannot fulfill its obligations as a Trustee and Responsible Agency for fish and wildlife resources. Permit negotiations conducted after and outside of the CEQA process are not CEQA-compliant because they deprive the public and agencies of their right to know what project impacts are and how they are being mitigated (CEQA Guidelines Section 15002).

Department Recommendations

The Department has the following concerns about the Project, and requests that these concerns be addressed in the CEQA document:

1. The CEQA document should quantify impacts to habitats and species as per the information requirements of CEQA. A map showing the areas of impact should also be included;

2. The CEQA document should include recent biological surveys for fauna and flora (CEQA Guidelines Section 15125(a)). The Department recommends that the Lead Agency contact the Department's California Natural Diversity Database (CNDDB) in Sacramento, (916) 327-5960, to obtain current information on any previously reported sensitive species and habitat, including Significant Natural Areas identified under Chapter 12 of the California Fish and Game Code. If state or federal threatened or endangered species may occur within the project area, species specific surveys, conducted at the appropriate time of year and time of day, should be included with the CEQA document. Acceptable species specific surveys have been developed by the Department, and by the U.S. Fish and Wildlife Service, and are accessible through each agencies websites. Assessments for rare plants and rare plant natural communities should follow the Department's 2009 Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities. If the Department's 2009 guidelines were not used, surveys conducted after the issuance of the 2009 guidance should be updated following the 2009 guidelines. The guidance document is available here: http://www.dfg.ca.gov/biogeodata/cnddb/pdfs/protocols_for_surveying_and_evaluating_impacts.pdf

3. The CEQA document should provide an analysis of habitat management conservation plans and natural community conservation plans, including the MSHCP. The CEQA document should include a discussion of how the project will affect reserve assembly; how the Project will affect the goals and objectives of the NCCP; the applicable policies and procedures that pertain to the Project; a discussion of survey requirements; and a list of proposed mitigation measures required by the NCCP. A copy of any documents required by the NCCP (e.g., Determination of Biologically Equivalent or Superior Preservation) should be included with the CEQA document.

4. The analysis in the CEQA document should satisfy the requirements of the Department's Lake and Streambed Alteration Program and CESA (if deemed necessary).

5. The CEQA document should provide a thorough analysis of direct, indirect, and cumulative impacts and identify specific measures to offset such impacts.

6. The CEQA document should analyze a range of fully considered and evaluated alternatives to the Project (CEQA Guidelines Section 15126.6).

7. The CEQA document should discuss the purpose of the proposed 74.8 acres of open space. Please elaborate on whether the open space will be conserved habitat or whether the area will be used as recreational open space.

In summary, the Department requests that the CEQA document include current information regarding biological resources, provide a delineation of State waters and associated habitat, and a proposal for mitigation for project-related impacts to State waters. If you should have any questions pertaining to these comments, please contact Robin Maloney-Rames, Environmental Scientist, at (909) 980-3818.

Sincerely,

Daniel Cox

Re: I-10 Gateway Center Project

Dear Mr. Rull:

Southern California Edison (SCE) appreciates the opportunity to provide comment on the Notice of Preparation of a Draft Environmental Impact Report for the I-10 Gateway Center Project. The proposed project consists of two "high-cube" industrial buildings (approximately 960,000 square feet and 1,600,000 square feet of floor area) for the distribution of goods. The project is located along the north side of Cherry Valley Blvd and east of Interstate 10 freeway, between the Cities of Calimesa and Beaumont in unincorporated Riverside County.

SCE maintains electrical transmission and distribution facilities, as well as substations and supporting appurtenances within Riverside County; therefore, SCE would be the electrical service provider for this project. We appreciate the development plan notification, which will assist us in planning for future electrical needs for the area. Currently, the project is within SCE's projected load growth for this area. However, the project developer will be responsible for the costs of any new distribution and/or line extension work, and any relocation of facilities required to accommodate the distribution line and/or service extensions required by SCE to serve the project.

If development plans result in the need to build new or relocate existing SCE electrical facilities that operate at or above 50 kV, please address the impacts related to the construction, operation, and maintenance of these facilities within the Draft EIR. New or relocated SCE electrical facilities that result in significant environmental impacts are subject to CEQA review per the California Public Utilities Commission's (CPUC) General Order 131-D, which could delay approval of SCE's portion of the project for two years or longer.

If you have any questions regarding this letter, do not hesitate to contact me at Louis.Davis@sce.com or (951) 249-8468.

Re: I-10 Gateway Center Project
SCH# 2014011009

Attached for your review and comment is the Notice of Preparation (NOP) for the I-10 Gateway Center Project draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Paul Rull
Riverside County
4080 Lemon Street, 12th Floor
P.O. Box 1409
Riverside, CA 92502-1409

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Present Land Use/Zoning/General Plan Designation: Vacant/Controlled Development Areas (W-2)/Community Development:

CVAR_98350

Project Description *(use separate sheet if necessary)*:
- General Plan Amendment No. 1079
- Change of Zone No. 7799
- Parcel Map No. 36564
- Plot Plan No. 25337
- Environmental Impact Report No. 534

General Plan Amendment (GPA1079) – proposes to change the current General Plan Land Use designation from Community Development: Very Low Density Residential (CD: VLDR) and Rural: Rural Mountainous (R: RM) to Community Development: Light Industrial (CD: LI) and Rural: Rural Mountainous (R: RM). In addition, the proposed project would require this General Plan amendment to adjust the boundary of the Cherry Valley Gateway Policy Area because the applicant is requesting to remove the project site from the Cherry Valley Gateway Policy Area.

Change of Zone (CZ7799) – proposes to change the existing zoning from Controlled Development Areas (W-2) to Industrial Park (I-P).

Parcel Map (PM36564) – proposes to create three industrial parcels.

Plot Plan (PP25337) – proposes to construct an industrial distribution facility consisting of two industrial buildings totaling 2,560,000 square feet, with 428 bay doors.

Environmental Impact Report No. 534 – provides an environmental analysis of the potential impacts of the proposed project.

Approximately 171.1 acres of the 246.5 acre Project site would be included within the developed portion of the Project. The remaining 74.8 acres would remain as open space (approximately 30.3 percent of the Project site). The Project consists of two (2) industrial buildings that will have sizes of approximately 960,000 square feet and 1,600,000 square feet for a total of approximately 2,560,000 square feet of floor area.

The Project site plan is depicted on Exhibit 3. Both buildings are planned as "high-cube" logistics uses for the distribution of goods. Both buildings would be up to approximately 47 feet in height. Three access points are proposed off Cherry Valley Boulevard. The primary access point is proposed as a signalized intersection, and will be located in the mid-portion of the project site between Building 1 and Building 2.

Water quality basins and improved drainage channels will be constructed to the west of Building 1. A concrete drainage channel will be located north of Buildings 1 and 2. Additionally, a grouted riprap berm and a water quality infiltration trench will be located north of Building 2. Riprap berms will be located east of Building 2 and two water quality basins are planned south of Buildings 1 and 2, paralleling Cherry Valley Boulevard. Additionally, a concrete drainage channel will be located south of the water quality basins and north of Cherry Valley Boulevard.

Existing drainage flows from offsite areas to the north and east of the project site, as well as runoff from the undeveloped portions of the site, would be conveyed through the site in concrete drainage channels and conveyed offsite on the west side of the property. Onsite runoff will be treated in the water quality infiltration trench located north of Building 2 and in two water quality basins located on the south side of the project site.

Water and sewer service for the Project will be provided by the Yucaipa Valley Water District (YVWD). In order to provide service to the Project site, the construction of off-site water and sewer lines in Cherry Valley Boulevard and Calimesa Boulevard will be needed. The project site is currently outside the boundaries of the YVWD; therefore, an application for annexation into the YVWD will be filed with the San Bernardino County Local Agency Formation Commission (LAFCO). Two water storage reservoirs, each with a one million gallon capacity, are proposed as part of the project on the northeastern portion of the project site. One of the reservoirs will be used for reclaimed water storage and one reservoir will be used for potable water storage.

Project grading activities would involve onsite cut of approximately 6 million cubic yards (cy) and fill of approximately 6 million cy. The site is designed for an earthwork balance and no import or export of soils will be needed. Limited off-site improvements will be needed along the east boundary of the project site for grading and drainage improvements, as well as access right-of-way.

There are three ephemeral drainages that traverse the Project site from east to west and northeast to southwest. Ephemeral drainages are drainages with water flows that generally occur for only a short period after a rain event. Although all on-site drainages are ephemeral and do not support wetland vegetation, there are some limited areas of the Project site that contain Waters of the U.S. and Waters of the State. Therefore implementation of the Project would require securing a Federal Section 404 permit and a State Section 1602 Streambed Alteration Agreement.

Land use approvals needed to implement the Project include: a Plot Plan; a Tentative Parcel Map; a zone change; and two General Plan Amendments. According to the County of Riverside General Plan, the Project site is currently designated as Very Low Density Residential (VLDR), and Rural Mountainous (RM) along the northern, steeper portion of the site. A General Plan Amendment is proposed to change the Land Use designation from VLDR to Light Industrial (LI) for approximately 155.2 acres. The General Plan land use designation for the 16.5 acres located within the City of Calimesa, which is Rural Living (RL), would not be changed, nor would the VLDR & RM designations for the 74.8 acres that would remain as open space. The applicant is also requesting a General Plan Amendment to remove the project from the Cherry Valley Gateway Policy Area.

The Project also includes a Change of Zone from Controlled Development (W-2) to Industrial Park (I-P) to be consistent with the General Plan Amendment for the 155.2 acre to be designated LI. The northern portion of the Project site that would remain as open space would remain zoned W-2, and the current zoning for that portion of the Project site within theh City of Calimesa would remain RL.

RE: SCAG Comments on the Notice of Preparation of an Environmental Impact Report for the I-10 Gateway Center Project [IGR7944]

Dear Mr. Rull:

Thank you for submitting the Notice of Preparation of an Environmental Impact Report for the I-10 Gateway Center Project to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including its Sustainable Communities Strategy (SCS) component pursuant to SB 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of the regional goals and policies in the RTP/SCS.

SCAG staff has reviewed the Notice of Preparation of an Environmental Impact Report for the I-10 Gateway Center Project. The proposed project includes two industrial high-cube logistics buildings that will have sizes of approximately 960,000 square feet and 1,600,000 square feet on an approximately 246.5 acre project site located within the Riverside County unincorporated community of Cherry Valley.

When available, please send environmental documentation to SCAG's *office in Los Angeles or by email to leep@scag.ca.gov* providing, at a minimum, the full comment period for review. If you have any questions regarding the attached comments, please contact Pamela Lee at (213) 236-1895 or leep@scag.ca.gov. Thank you.

Sincerely,

Jonathan Nadler,
Manager, Compliance and Performance Assessment

[1] SB 375 amends CEQA to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows for certain CEQA streamlining for projects consistent with the RTP/SCS. Lead agencies (including local jurisdictions) maintain the discretion and will be solely responsible for determining "consistency" of any future project with the SCS. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a finding of consistency under SB 375 for purposes of CEQA streamlining.

COMMENTS ON THE NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT FOR THE I-10 GATEWAY CENTER PROJECT [SCAG NO. IGR7944]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS.

RTP/SCS Goals

The 2012 RTP/SCS links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic and commercial limitations (see http://rtpscs.scag.ca.gov). The goals included in the 2012 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2012 RTP/SCS are the following:

SCAG 2012 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and non-motorized transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the policy and supportive analysis in a table format. Suggested format is as follows:

CVAR_08355

SCAG 2012 RTP/SCS Goals		
Goal		**Analysis**
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness.*	*Consistent: Statement as to why* *Not-Consistent: Statement as to why* *or* *Not Applicable: Statement as to why* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region.*	*Consistent: Statement as to why* *Not-Consistent: Statement as to why* *or* *Not Applicable: Statement as to why* *DEIR page number reference*
etc.	etc.	etc.

RTP/SCS Strategies

To achieve the goals of the 2012 RTP/SCS, a wide range of strategies are included in SCS Chapter (starting on page 152) of the RTP/SCS focusing on four key areas: 1) Land Use Actions and Strategies; 2) Transportation Network Actions and Strategies; 3) Transportation Demand Management (TDM) Actions and Strategies and; 4) Transportation System Management (TSM) Actions and Strategies. If applicable to the proposed project, please refer to these strategies as guidance for considering the proposed project within the context of regional goals and policies. To access a listing of the strategies, please visit http://rtpscs.scag.ca.gov/Documents/2012/final/f2012RTPSCS.pdf (Tables 4.3 – 4.7, beginning on page 152).

Regional Growth Forecasts

The Draft EIR for the I-10 Gateway Center Project should reflect the most recently adopted SCAG forecasts (see http://scag.ca.gov/Documents/2012AdoptedGrowthForecastPDF.pdf), which consists of the 2012 RTP/SCS population, household and employment forecasts. The forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts		**Adopted Unincorporated Riverside County Forecasts**	
Forecast	**Year 2020**	**Year 2035**	**Year 2020**	**Year 2035**
Population	19,663,000	22,091,000	43,500	58,100
Households	6,458,000	7,325,000	15,400	20,900
Employment	8,414,000	9,441,000	5,100	6,900

MITIGATION

SCAG staff recommends that you review the SCAG 2012 RTP/SCS Final Program EIR Mitigation Measures for guidance, as appropriate. See Chapter 6 (beginning on page 143) at:
http://rtpscs.scag.ca.gov/Documents/peir/2012/final/Final2012PEIR.pdf

As referenced in Chapter 6, a comprehensive list of example mitigation measures that may be considered as appropriate is included in Appendix G: *Examples of Measures that Could Reduce Impacts from Planning, Development and Transportation Projects.* Appendix G can be accessed at:
http://rtpscs.scag.ca.gov/Documents/peir/2012/final/2012fPEIR_AppendixG_ExampleMeasures.pdf

RE: SCH#2014011009; CEQA Notice of Preparation (NOP); draft Environmental Impact Report (DEIR) for the **"I-10 Gateway Center Project;"** located in Community of Cherry Valley; Riverside County, California

Dear Mr. Rull:

The Native American Heritage Commission (NAHC) has reviewed the above-referenced environmental document

The California Environmental Quality Act (CEQA) states that any project which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA guidelines 15064.5(b). To adequately comply with this provision and mitigate project-related impacts on archaeological resources, the Commission recommends the following actions be required:

Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, pursuant to California Environmental Quality Act (CEQA) §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities. Also, California Public Resources Code Section 21083.2 require documentation and analysis of archaeological items that meet the standard in Section 15064.5 (a)(b)(f).

We suggest that this (additional archaeological activity) be coordinated with the NAHC, if possible. The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. Any information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure pursuant to California Government Code Section 6254.10.

SOBOBA BAND OF LUISEÑO INDIANS
EST. JUNE 19, 1883

Re: Notice of Preparation of a Draft EIR for I-10 Gateway Center Project, EIR No. 534, General Plan Amendment No. 1079, CZ No. 7799, Parcel Map No. 36564

The Soboba Band of Luiseño Indians appreciates your observance of Tribal Cultural Resources and their preservation in your project. The information provided to us on said project has been assessed through our Cultural Resource Department, where it was concluded that although it is outside the existing reservation, the project area does fall within the bounds of our Traditional Use Areas.

Soboba Band of Luiseño Indians is requesting the following:

1. To initiate a consultation with the Project Developer and Land owner.
2. The transfer of information to the Soboba Band of Luiseno Indians regarding the progress of this project should be done as soon as new developments occur.
3. Soboba Band of Luiseño Indians continues to act as a consulting tribal entity for this project.
4. Working in and around traditional use areas intensifies the possibility of encountering cultural resources during the construction/excavation phase. For this reason the Soboba Band of Luiseño Indians requests that a Native American monitoring component be included as a mitigation measure in the Environmental Impact Report for all ground-disturbing activities that are expected to go into native soil. The Tribe is requesting that a Treatment and Dispositions Agreement between the developer and The Soboba Band be provided to the County of Riverside prior to the issuance of a grading permit and before conducting any additional archaeological fieldwork.
5. Request that proper procedures be taken and requests of the tribe be honored (Please see the attachment)

The Soboba Band of Luiseno Indians is requesting a face-to-face meeting between the County of Riverside Planning Department and the Soboba Cultural Resource Department. Please contact me at your earliest convenience either by email or phone in order to make arrangements.

Sincerely,

Joseph Ontiveros
Director of Cultural Resources
Soboba Band of Luiseño Indians
P.O. Box 487
San Jacinto, CA 92581
Phone (951) 654-5544 ext. 4137
Cell (951) 663-5279
jontiveros@soboba-nsn.gov

Cultural Items (Artifacts). Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer should agree to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

The Developer should waive any and all claims to ownership of Native American ceremonial and cultural artifacts that may be found on the Project site. Upon completion of authorized and mandatory archeological analysis, the Developer should return said artifacts to the Soboba Band within a reasonable time period agreed to by the Parties and not to exceed (30) days from the initial recovery of the items.

Treatment and Disposition of Remains.

A. The Soboba Band shall be allowed, under California Public Resources Code § 5097.98 (a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and grave goods shall be treated and disposed of with appropriate dignity.

B. The Soboba Band, as MLD, shall complete its inspection within twenty-four (24) hours of receiving notification from either the Developer or the NAHC, as required by California Public Resources Code § 5097.98 (a). The Parties agree to discuss in good faith what constitutes "appropriate dignity" as that term is used in the applicable statutes.

C. Reburial of human remains shall be accomplished in compliance with the California Public Resources Code § 5097.98 (a) and (b). The Soboba Band, as the MLD in consultation with the Developer, shall make the final discretionary determination regarding the appropriate disposition and treatment of human remains.

D. All parties are aware that the Soboba Band may wish to rebury the human remains and associated ceremonial and cultural items (artifacts) on or near, the site of their discovery, in an area that shall not be subject to future subsurface disturbances. The Developer should accommodate on-site reburial in a location mutually agreed upon by the Parties.

E. The term "human remains" encompasses more than human bones because the Soboba Band's traditions periodically necessitated the ceremonial burning of human remains. Grave goods are those artifacts associated with any human remains. These items, and other funerary remnants and their ashes are to be treated in the same manner as human bone fragments or bones that remain intact

Coordination with County Coroner's Office. The Lead Agencies and the Developer should immediately contact both the Coroner and the Soboba Band in the event that any human remains are discovered during implementation of the Project. If the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner shall ensure that notification is provided to the NAHC within twenty-four (24) hours of the determination, as required by California Health and Safety Code § 7050.5 (c).

Non-Disclosure of Location Reburials. It is understood by all parties that unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and shall not be governed by public disclosure requirements of the California Public Records Act. The Coroner, parties, and Lead Agencies, will be asked to withhold public disclosure information related to such reburial, pursuant to the specific exemption set forth in California Government Code § 6254 (r).
Ceremonial items and items of cultural patrimony reflect traditional religious beliefs and practices of the Soboba Band. The Developer agrees to return all Native American ceremonial items and items of cultural patrimony that may be found on the project site to the Soboba Band for appropriate treatment. In addition, the Soboba Band requests the return of all other cultural items (artifacts) that are recovered during the course of archaeological investigations. Where appropriate and agreed upon in advance, Developer's archeologist may conduct analyses of certain artifact classes if required by CEQA, Section 106 of NHPA, the mitigation measures or conditions of approval for the Project. This may include but is not limited or restricted to include shell, bone, ceramic, stone or other artifacts.

Subject: Review of Applicable Environmental Impact Report (EIR) Sections, and Supporting Technical Report (Appendix B) — *Air Quality and Greenhouse Gas Analysis Report, I-10 Gateway Center, Riverside County, California (PP25337)*

Dear Mr. Rull:

URS Corporation (URS) has completed a review of the *Air Quality and Greenhouse Gas Analysis Report* for *I-10 Gateway Center, Riverside County, California* (Michael Brandman Associates, July 3, 2013).

The methodology used in the analysis appears sound and the level of detail provided is very good. However, there are questions regarding the data, calculations and text descriptions presented in the report. Detailed comments are presented below.

Technical Report (Appendix B: Air Quality and Greenhouse Gases)

1. The Appendix B cover page (first page of PDF) is labeled with a "draft" watermark. URS would just suggest that the County confirm that the document has not been subject to further revision since its receipt.

2. The Air Quality and GHG Analysis has its own four appendices but it is itself an appendix (Appendix B) of Draft EIR. URS would suggest changing "appendix" to "attachment" or something similar to avoid reader confusion. Since the Draft EIR provided mimics the contents of the Appendix B document very closely, it will be checked for consistency upon receipt of revised Appendix B text (and results, if necessary).

3. The Description provided under Section 1.2-Project Summary does not mention the types and/or number of trucks that may be expected to frequent the facility, nor is there mention of emergency generators or other types of combustion sources (e.g. boilers) that may be situated at the facility. If any of this type of equipment will be included in the school construction/operation, then those emissions should be *at least* discussed and perhaps

URS Corporation
4225 Executive Square, Suite 1600
La Jolla, CA 92037
Tel: 858.812.9292
Fax: 858.812.9293

considered in the discussion of potential health risks and air permitting requirements (esp. those sources which are diesel-fueled).

4. Would this project involve demolition and/or soil hauling (i.e. soil import/export) activities? If demolition and/or soil hauling activities should be included, the project description should be revised to reflect that, and CalEEMod should be re-run and the new results presented. Later learned in sub-section Construction Offsite Trips of Section 5.2.1 that soil import/hauling will occur; please add such information to the project description.

5. Some of the rules detailed in Section 1.3-Standard Conditions may not apply to this type of development. The fireplace prohibition (Rule 445) would seem not to apply and the spray coating rule (Rule 481) does not seem appropriate either. The applicability and appropriateness of the indicated rules show be reviewed and, if necessary, revised.

6. Do not see mention of state Airborne Toxic Control Measure (ATCM) that recommends that trucks limit idling to 5 minutes at any location (http://www.arb.ca.gov/toxics/idling/idling.htm).

7. The lead-in to Section 1.3.2-California mentions the California Green Building Standards after Title 24, but does not provide a discussion of those standards as it does for for Title 24.

8. Item h of MM AQ-5 appears to be a duplicate of MM AQ-2. Not sure what is meant by "Tenants" in these two references. Was this meant to address HHD trucks of contractors delivering equipment and/or supplies?

9. Item c of MM AQ-7 under Operation does not detail the "year 2007 or newer engines" limitation for HHD trucks discussed prior; instead, it just says that all fleet equipment and vehicle engines shall be properly maintained in good condition and according to manufacturers' specifications.

10. Should MM AQ-9 be labeled a GHG measure (e.g. MM GHG-1), as it pertains to solid waste?

11. The report exhibits numerous typographical errors, such as the last sentence in the first paragraph of Section 2.1.2-Local Air Quality, which should read "…within the SoCAB…."

12. Suggest that footnotes b and c of Table 1 detail the approximate distance and direction to the alternate monitoring stations (those other than Banning Airport, which was mentioned in the text).

13. The presentation of excerpted text (indented) on ultrafine particulate beginning on Page 23 of the very lengthy Section 2.1.3-Toxic Air Contaminants is confusing as it is difficult to ascertain where excerpts start/stop. Suggest using italics or quotes, along with indention.

14. The following statement and others among it seeks to discount the prescribed risk assessment methods: "These are incredibly conservative assumptions that are not replicated in reality." CAPCOA's July 2009 *Health Risk Assessments for Proposed Land Use Projects* specifically warns against the use of such wording to discount standardized health risk assessment methodologies.

15. At the end of Section 2.1.3-Toxic Air Contaminants is a sub-section that seems out of place, titled "Local Sources of Air Pollution," that discusses the projects location and proximity with respect to other sources. It seems to imply that the residential neighborhoods are large sources of TACs, along with the freeways in the area.

16. Table 4: Description of Air Pollutants includes a 2009 CARB reference, while the most recent CARB table of California and federal standards is dated June 2013 (http://www.arb.ca.gov/research/aaqs/aaqs2.pdf).

17. Is the statement regarding 1-hour ozone federal standard under *2003 AQMP* sub-section (on Page 33) still appropriate, since this standard is no longer?

18. The 2012 AQMP section appears dated and requires update (e.g. "U.S. EPA has established a due date of December 14, 2012").

19. Please update the discussion in Section 3.3 to include recent international, federal, and state GHG regulatory developments in the report. For instance, international climate change efforts by the UNFCCC and the Kyoto Protocol, federal efforts including President Obama's recent plan to address climate change, and legislation and rule-making at the state-level and county-level.

20. Table 7: Locations of Sensitive Receptors has several typographical errors, the most notable of which is the lack of a distance for the Tournament Hill Elementary School.

21. Does Table 9: SCAQMD Localized Significance Thresholds – Operations only show the higher of state/federal values, where not noted (e.g. annual NO2 of 0.0534 ppm not presented)?

22. For air quality regional impact, the project emissions should be included in a dispersion modeling air quality impact analysis (AQIA) only for those the pollutants that are above the SCAQMD's construction or operational LST thresholds. Please explain why dispersion modeling was used, why for only certain pollutants, and what phases were included in the modeling.

23. Table 10: Will the project also have architectural coating which is typical for the warehouses and is stated in page 71?

24. Since this report was published, newer CalEEMod versions (the latest being 2013.2.2) have been released to correct several emission calculation errors. Recommend that the latest CalEEMod version be used for further analysis or reruns of this project, as it incorporates the emission factors of EMFAC2011 and OFFROAD2011 and allows the reviewer to quickly identify which default values in the model were overwritten. Without the electronic input files that correspond to the provided output, the reviewer is not able to assess the inputs used. URS will leave to the discretion of the County Planner whether or not the new CalEEMod version should be used for this project going forward.

25. The AERMOD version number shows in Appendix, but it should also be provided in Section 5.1.

26. The discussion of, and presentation of, Table 11: Construction Duration suggests that the individual construction phases/durations would not occur concurrently; such an assumption should be distinctly stated in the report. If the detailed construction phases are to overlap, then a description of how those emissions were quantified during the period of the overlap should be provided. A table indicating the expected start date for each respective construction phase duration, as input to CalEEMod, would also be appropriate.

27. Does the statement "Soil stabilizers for unpaved roads" in Table 12: Best Available Control Measures imply something more than water (i.e. dust suppressant additives)? Please make sure that the measures included in Table 12 (e.g. "replace ground cover", "Pre-water to 12% moisture") and CalEEMod are capable of being applied, as they may be included as part of conditions of approval.

28. Several discrepancies appear to exist on Pages 71 and 72, under section labeled "Other Emission Sources," including:

    a. Does the CalEEMod guidance recommend modifying the VOC emission factor for Consumer Products?

    b. The term refrigerated warehouse is included in the Consumer Products section; however, the land use input chosen in CalEEMod was specifically for ***unrefrigerated*** warehouse. Suggest that the appropriate square footages of refrigerated space be accounted for separately.

    c. Landscape Equipment defaults in CalEEMod were used; however, no water consumption was included for landscaping. Since the Vegetation section on Page 73 says there will there be landscaping, please include an estimate of outdoor water demands? One of the dust prevention methods was replacement of landscaping.

d. Use of the more recent version of CalEEMod would likely change many of the defaults discussed on these two pages and improve upon the operational emissions inventory for both criteria pollutants and GHGs.

29. Due to the lot size and amount of soil hauling, please make sure that the fugitive dust and exhaust emissions associated with onsite haul truck travel on unpaved roads is accounted for or addressed.

30. Recommend explaining the receptor spacing used on the facility perimeter and show the facility perimeter and scale in a revised Exhibit 6 (white receptors do not show well on all sides)

31. Also, recommend explaining modeling methodology in greater detail and expanding the information presented in Table 22. For example, presenting an exhibit to show the modeled fenceline, sources locations and parameters, how to process the results, and how to treat the line sources in AERMOD dispersion modeling.

32. Have the emissions associated with transportation refrigeration units (TRUs) been included?

33. Recommend that Table 24: Inhalation Exposure Factor Values for Sensitive Receptors reference the appropriate reference (i.e. SCAQMD handbook) for these values, rather than SCAQMD Rule 1401.

34. Recommend that the step taken to convert the output from AERMOD (in micrograms per cubic meter) to ppm be shown, in the case of CO and NO2 results presented in Table 26: Localized Significance Analysis (Operations). The same table shows no units for Annual NO2 line, and the model output that supports the value shown could not be found in the appendix.

35. Table 26: The NAAQS and CAAQS should also be used and compared in this table. Please explain why background levels are not defined for PM10 and PM2.5 for purposes of significance testing.

36. On Table 24, please define the Business as Usual (BAU) scenario and add baseline GHG emissions and discussion as appropriate. The BAU year should have the same year as project build-out so they can be comparable. URS suggests that the applicant and/or its consultant re-evaluate appropriate and clearly-defined assumptions and reasonable conditions for the BAU scenario. Existing regulations and mandatory requirements in the foreseeable future should be taken into account for BAU. The BAU scenario should use the existing general plan designation and features.

37. Based on the project description, the two warehouse buildings will be LEED certified. Please include this feature in the emissions, mitigations, and analysis.

38. Please explain the message found in all AERMOD runs regarding: "*SOURCE-RECEPTOR COMBINATIONS FOR WHICH CALCULATIONS MAY NOT BE PERFORMED; LESS THAN 1.0 METER* WITHIN OPENPIT; OR BEYOND 80KM FOR FASTAREA/FASTALL." This message appears to have occurred for 365 such combinations in the case of the CO run.

39. On Page 7 of the DPM analysis in Appendix C, the LHDT1-DSL values shown at bottom of page could not be duplicated using the information provided above it. For instance, a value of 4.17E-7 was calculated for "I10 to Driveway 1" (versus the 4.51E-7 shown). Please advise on this discrepancy.

40. Page 8 of the DPM analysis in Appendix C show the estimated 70-year average DPM emission factors (including appropriate portions of EMFAC2011 output); please provide further detail on how these were calculated. Also, please clarify the note on the same page regarding LHDT-DSL.

41. It is difficult to check the large amount of calculations used in estimating the inputs to the AERMOD modeling for all of the individual pollutants without the source spreadsheets. Please provide electronic copies of the source spreadsheets with any future revisions in order that they may be more accurately evaluated.

42. Many warehouses have fuel-combusting forklifts and other off-road equipment to support the operation. Please verify if such off-road equipment will be used during the project operation. If so, please add this equipment and re-run the model.

43. Suggest that all mitigation measures and all changes to model default values be summarized and presented and justified in the text of the report.

44. As a point of information, the SCAQMD has previously recommended that other lead agencies (including those outside the City of Riverside) refer to the "City of Riverside's Good Neighbor Guidelines for Siting New and/or Modified Warehouse Distribution Facilities" for such projects.

45. It is not clear if the proposed project is consistent with the existing General Plan land use designations for the site. We advise that the applicant/consultant confirm this with the County Planning Department. If this is true, the proposed project should answer the question on page 109, "Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?"

The recommendations and suggestions provided in this correspondence should not be construed as definitive requirements and it is understood that the County of Riverside will have discretion regarding implementation. We appreciate this opportunity to assist the County of Riverside TLMA.

If you have questions or would like to discuss this matter, please contact me, at (858) 812-8264 or via e-mail at eric.carlson@urs.com, or Julie Mitchell, at (858) 812-8273 or via e-mail at julie.mitchell@urs.com.

Re: I-10 Gateway Center Project

Dear Mr. Rull:

Southern California Edison (SCE) appreciates the opportunity to provide comment on the Notice of Preparation of a Draft Environmental Impact Report for the I-10 Gateway Center Project. The proposed project consists of two "high-cube" industrial buildings (approximately 960,000 square feet and 1,600,000 square feet of floor area) for the distribution of goods. The project is located along the north side of Cherry Valley Blvd and east of Interstate 10 freeway, between the Cities of Calimesa and Beaumont in unincorporated Riverside County.

SCE maintains electrical transmission and distribution facilities, as well as substations and supporting appurtenances within Riverside County; therefore, SCE would be the electrical service provider for this project. We appreciate the development plan notification, which will assist us in planning for future electrical needs for the area. Currently, the project is within SCE's projected load growth for this area. However, the project developer will be responsible for the costs of any new distribution and/or line extension work, and any relocation of facilities required to accommodate the distribution line and/or service extensions required by SCE to serve the project.

If development plans result in the need to build new or relocate existing SCE electrical facilities that operate at or above 50 kV, please address the impacts related to the construction, operation, and maintenance of these facilities within the Draft EIR. New or relocated SCE electrical facilities that result in significant environmental impacts are subject to CEQA review per the California Public Utilities Commission's (CPUC) General Order 131-D, which could delay approval of SCE's portion of the project for two years or longer.

If you have any questions regarding this letter, do not hesitate to contact me at Louis.Davis@sce.com or (951) 249-8468.

Subject: We do not want Gateway Warehouse

Dear Sir,
We moved to Cherry Valley 8 Yrs. ago from Long Beach to get away from Traffic and Big Trucks. We enjoy the fresh air and quite times here If we wanted to live near the trucks and traffic and smell of industry we would have moved to Fontana or Ontario. Please do not allow this project to proceed forward at this location. Put it over by the existing Warehouse areas. We have enough traffic and road wear and over used infrastructure. Thank You for your time and consideration in this matter. My Horses and poultry thank you also.

Paul Rull (Project Planner)

I am NOT in favor of a developer wanting to build a 2.5 million foot warehouse next to my mobile home park (Rancho Calimesa MHP). All these trucks will definetly create poor air quality. It will be noisy, Trucks will be tearing up our streets. Property values will be lower. Cherry Valley Blvd. interchange is NOT adequate. A better location would be on Cherry Valley Blvd. where the old chicken coups were...not on property next door to our park.

Subject: Beaumont Wharehouse slated for cherry valley

I am a proud beaumont home owner/resident. I am extremely concerned about my family's livelihood. I reside in the housing track off of cherry valley just south of the freeway. This warehouse would draw health concerns as well as a traffic nightmare. I strongly appose the construction of the gigantic warehouse. All home owners already suffered a great loss during these trying times and we can't afford to let our homes drop in value any further due to the construction of the warehouse.

Subject: Gateway Warehouse Project

My husband Bill and I are very much against the warehouse being planned at the 10 freeway and Cherry Vally Blvd. This will not only affect the air quality and the property value it would make getting on th freeway impossible. It could use traffic signals there now.

There was another project planned there years ago that they gave up on because the EBX2 State Water Supply will run through that area.

This a very bad idea for a rural area.

Subject: I-10 Gateway Center Project

Mr. Rull,
I am writing in opposition to the proposed Gateway Center Project including any zoning changes. We are a rural community and the proposed zoning change is not in harmony with our community of interest or who be are or what we are about.
We have grave concerns about the significant increase in traffic, noise pollution and safety issues this will create. The added air pollution to the nearby community of senior citizens will be detrimental to their health. This could well affect the health of others in the area especially those who have allergies, asthma and other pulmonary conditions.
The natural habitat will be severely altered with this development as will the surrounding plant life and aesthetics.
Hazardous waste and diesel spills could be a likely event with this development.
This is not a good fit for our community.
Please add my name to your email list for future meetings and literature pertaining to this project.
Thanks,
Dr. Blair Ball

Subject: Objections to Gateway Center Project
Mr. Rull:

As a resident of Cherry Valley for near 45 years, I wish to make you aware of mine and my family's great concern over the proposed Gateway Center project.

This area of Riverside County is NOT the place for such an industrial project. Cherry Valley is a beautiful place and should not be sacrificed for revenue.

Traffic would be horrendous, and pollution is major issue (have you heard about the correlation between autism and pollution?).

I have had visitors from out-of- state visit Cherry Valley and express their surprise that such a lovely rural area could be so near freeways and cities. It is a hidden jewel, and has been the home of 5 generations of our family.

Please, do not allow a project of this nature to even come near Cherry Valley. It is totally incompatible with this area.

Thank you.

Subject: Proposed Cherry Valley Gateway Project

Dear Mr. Rull,

I am writing in regards to the proposed Gateway Project in Cherry Valley. As a Cherry Valley Resident, the scope and location of this proposed warehousing site alarms and concerns me.

It is my understanding that this proposed industrial distribution facility will consist of two industrial buildings totaling 2,560,000 square feet with 428 bay doors on 246.5 gross acres to be built north of Cherry Valley Boulevard and east of Interstate-10.

Cherry Valley and particularly Cherry Valley Boulevard is a very poor location for an industrial complex of this size and scope. The amount of freight traffic this will create will make Cherry Valley Boulevard and the freeway intersection a nightmare. I use Cherry Valley Boulevard to commute to work every day and cannot even imagine an industrial business of this size along the Boulevard.

This will also affect air quality and change the rural atmosphere of Cherry Valley forever. Please do not consider allowing this large industrial complex in this residential / agricultural area of Cherry Valley. It should be located elsewhere in an already developed industrial area.

Sincerely,

Cathy Schaefer
Cherry Valley Resident

Subject: Gateway Project

I'm a homeowner in Fairway Canyon and I want to say that I am strongly against the development of the Gateway Project on Cherry Valley. I am sure that you do not care that it is developed in Cherry Valley, because you live nowhere near it, but I have a family that is very concerned about the increased pollution and traffic from large trucks. There is already a great deal amount of traffic entering and exiting the 10 freeway from Cherry Valley, but once Fairway Canyon is fully developed and the Gateway Project is developed, traffic will be unbearable.

I am sure that you have had no tax paying homeowners in this area in favor of this proposed development. My family, and the families of Fairway Canyon, urge you to please look elsewhere for this project.

Thank you for your consideration of this matter.

Sincerely,

Chris Brown
Fairway Canyon Resident

Subject: The Gateway Project
Dear Mr. Rull,

My name is Christy Sterling and I am a long time resident and property owner in Cherry Valley. I am writing to you today to voice my concern regarding the Gateway Project. I do not want this project in my community. We already have to much traffic trying to get on the freeway now and when we have had to evacuate due to wildfires it was worse. In our community there is only two ways out of my area of Cherry Valley, Beaumont Ave. and Cherry Valley Blvd. When trying to evacuate the proposed Project would cause extreme problems.

I am also concerned about the air quality. With the proposed project our air quality would be outrageous.

I would like our quality of life here in Cherry Valley to remain rural not large scale commercial.

I ask you to please stop this project from happening. My family and I are against this project, so please help us keep our quality of life that we try hard to keep.

Thank you for your time and consideration,

Christy Sterling

I live near what is supposed to be the gateway project in cherry valley .. cherry valley is NOT the place for a monstrosity such as this . This is a quiet community that has NO industrial development of any kind anywhere and the citizens of cherry valley are not going to stand for this put anywhere near them .. You need to put this disgusting building in an industrial area , not in a residental area where we will have to spend every day dealing with hundreds of trucks and pollution in the air 24 hrs. a day . Cherry valley has remained as it is and to the delight of everyone who lives here . This project will not only bring a load of disgust handed to the developer but there are a couple of organizations here who will do more than just say dont put this among us . I have spoken to all of my neighbors and you are not going to get anyone who lives here to agree to have this put in our lap so I think you should tell this developer to go find a much more suitable place where it will be accepted because here you are up against everyone .

Subject: Opposed to the warehouse

I am opposed to the proposed warehouse for Cherry Valley, California. What a disaster this will create. This will cause a huge disruption of air quality for the pass. Our air quality is already bad enough with the way the mountains keep in all the bad air and let the clean air go. This will only add to air pollution we are already trying to deal with.

Have you personally tried to exit the off ramps where this proposed warehouse will be? They are no where near fit for semi trucks to be getting on and off the freeway. I use those on and off ramps every day and even cars have trouble seeing around the blind corner that the bridge causes. This is a recipe for serious traffic congestion.

Why don't you put this warehouse out in the desert somewhere where there aren't any people living, and you could build double the size! Instead of using trucks you can put all the material onto the railroads that are already built and ship them that way. I am strongly opposed to this warehouse, and you will kill Cherry Valley if you proceed any further with your plans.

Subject: Proposed Logistics Site in Cherry Valley
Mr. Rull,

As a resident of Beaumont, I would like to express my opinion against the future building of the proposed warehouse on Cherry Valley Blvd.

We personally are just recovering from the low, low property values in this area. It is a slow grow. Having a 2.5 million square foot warehouse within a few miles of our home would not appreciate the value of our home. It would cause pollution in the air and on the streets. The exit at Cherry Valley is already heavily traveled and difficult to use in it's current state. To add to the congestion with over 400 loading docks just down the street would negatively impact this area.

I strongly urge you to reconsider this project and the deep implications it would have.

Subject: Warehouse on Cherry Valley

I am writing to you to request your assistance in stopping the zoning change from residential to commercial on Cherry Valley to allow a warehouse to be built. I purchased a home in this rural area to escape the industrial mess this would create. The freeway access is so far from being adequate for this increase in truck traffic. The wildlife and natural beauty of this area will be destroyed and the safe family community will be changed forever. Please help this community stay as it was intended. The amount of city taxes we pay in this area is so outrageous .....that alone should be a consideration for not changing what we were told would exist in the area when we made the choice of buying here. I would never have purchased here if I would have known my entrance view to this area would be a gigantic warehouse and a zillion trucks. Please help in this matter. Sincerely, Debbie

Subject: Gateway Project

January 20, 2014
Paul Rull
Project Planner
Riverside County Planning Department
PO BOX 1409
Riverside, CA 92502-1409

Dear Mr. Rull,
I, and I assure you, many others are distressed over the proposal for the Gateway Center Project in Cherry Valley. I moved to Cherry Valley to be in a rural area, I love its beauty, the rolling hills and mountains. By placing this huge Industrial Park, as it is called, right on Cherry Valley Boulevard near the 10 freeway would greatly devalue the land value and homes nearby. It would cause traffic mayhem with huge trucks coming in and out to unload or load from the freeway. There would be noise and air pollution problems, the quiet of the hills would be forever lost, the easy access for us using Cherry Valley Boulevard to the 10 would be greatly compromised. The 47 feet tall buildings would be a blight on the landscape. Nature is still the best designer in my and many others eyes. Right now we have a few farm buildings with rolling hills in a vast landscape, a remarkable feat of nature. I would not like to see that bulldozed and concreted by man. It might profit the builders but not us who live here. Once we go in and build and change the landscape, we never can return it to what it once was, I am for keeping the beauty we have and the rural atmosphere of Cherry Valley. I don’t want the noise, air pollution and traffic problems the Industrial Park will bring.
Sincerely yours,

Diane Franklin

Subject: Proposed warehouse project in Cherry Valley

Mr. Rull,

My wife and I are residents/homeowners in the Rancho Calimesa senior mobile home park near the proposed project. We would have no objection to development of the Cherry Valley property for residential or other purposes consistent with the **rural nature** of this region. We do have concerns regarding the noise, dust, exhaust fumes, and traffic resulting from the potential construction and completion of this project. It seems that reconstruction of the Cherry Valley Blvd. freeway exit would be needed to accommodate the added truck traffic, causing further disruption to the lives of our park's and Cherry Valley's residents.

We understand that there are not even any actual tenants for this disruptive project; it would be built on speculation. How many vacant commercial buildings and building sites are there in the Banning-Yucaipa area? Why should not one of these be used?

One of the major attractions of this mobile home park for us was its setting in a rural area. Please do not allow this attraction to be destroyed by placing a large commercial development nearby.

Respectfully yours,
Don and Kamara Belding

In what way have we really "progressed" beyond the basic concepts of the Declaration of Independence? "We hold these truths to be self evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men deriving their just powers from the consent of the governed."

"Of all the dispositions and habits, which lead to political prosperity, Religion and Morality are indispensable supports. In vain would that man claim the tribute of Patriotism, who should labor to subvert these great pillars of human happiness, these firmest props of the duties of Men and Citizens."

Subject: Gateway Project

Dear Mr. Rull

It has come to my attention recently of the proposed Gateway Project to be constructed in Cherry Valley. By this email I am expressing deep concern- not merely a NIMBY (Not in My Backyard).

I have been a homeowner for 20 plus years here and am quite familiar with the terrain, water, and wildlife and traffic pattern of the area

The Gateway project for 2.5 million distribution center is dangerous to environment, citizens both young and old, and our very future.

I am certain the proponents will tout "jobs, no impact, no water use, etc etc".

These are falsehoods- it is apparent the Gateway will have long term adverse consequences to the area- including but not limited to:

Construction in a wildlife corridor
Property devaluation
Traffic- with or without "improvement"
Increased particulates generated by vehicular traffic- not to mention diesel particulates

I am very concerned this project has been-albeit legally thus far- rather clandestine and back doored to the detriment of the population.

I look forward to your response and remain in watchful vigilance

To: Rull, Paul
Subject: I OBJECT to theI-10 Gateway Warehouse Project in Cherry Valley

Hi Mr Rull,

My main issues are: Air Quality, Traffic Congestion, Noise and Planning Changes.

Air Quality. Nearly 30 years ago I pulled off the freeway on the Yucaipa hill going to work in Redlands to take a picture. The smog sitting in the San Bernardino Valley was so odious that I felt pretty smart to have moved away. Recently, another warehouse project came to build in our area. A man from AQMD talked about the potential health problems from diesel. That issue remains the same for this project. Would you want your grandchild to live here? Maybe not if this warehouse project goes in.

Traffic at the I-10. Cherry Valley has 3 direct routes to access the freeway. Residents already avoid the Beaumont Avenue and Highland Springs routes from Cherry Valley to the freeway due to dangerous congestion. The only remaining interchange, the one at Cherry Valley Blvd., is already dangerous and seems way too small for the truck traffic I would expect from this project. Cal Trans didn't help us with Highland Springs or Beaumont Avenue in recent years and I don't think they will be able to help here either. This will surely make even a trip to the doctor hard to navigate.

Noise. Warehouse traffic would be 24/7 if this were approved. At night I can hear the rumble of trains 2 miles away. Sound carries because there isn't a bunch of competing background noise. That is what "peaceful" means. Folks go on vacation to find this quality. We have it now and we want to keep it.

Overall County Plan. After I moved to Cherry Valley years

ago, I attended Riverside County meetings as far away as Indio to ensure that our area would retain a rural character. I believed that we had molded a plan to develop Riverside County with zones which retain pockets of quieter, slower, human values among more dense development. I believe people need some sparse open quieter areas. Please help us preserve our vision of many years.

PLEASE.... This Project Needs to be farther from residential communities, perhaps closer to a railroad in a desert.

Fran Flanders, Cherry Valley

Subject: Support Zoning Change for Riverside County

Dear Representative Paul Rull,

I would like to express support for the planned zoning change to allow the presently zoned residential zone to commercial and allow the constructon of a Warehouse. There are NO houses near the proposed project.

The location is adjcent to the 10 expressway at the Cheery Valley road exit and would result in minimal traffic congestion on the Cheery Valley road.

However**, approval should only be granted if i the zoning includes major expansion of the two freeway ramp**s because the warehouse could expand to 428 loading docks. That would result in major congestion if the two overpasses near the project are not expanded significantly.

This project would add many needed jobs to the area and increased property taxes for the area. Your vote and support is needed. How you stand on this project will portray your position on job growth.

Respectfully Requested,

Gene De Fouw

Subject: Proposed zone change for warehouse in Cherry Valley
Dear Mr. Paul Rull,

I am writing to express my concern about the proposed construction of a 2.5 million square foot warehouse in Cherry Valley. As a resident and homeowner in Fairway Canyon, I am strongly opposed to such a building being placed at such close proximity to my place of residence. I am sure you can understand my concern as I am certain this would not be something you'd like in your own "backyard".

For starters, the air quality will surely decline with the increase of trucks accessing the warehouse. Furthermore, the freeway off and on ramps for Cherry Valley Blvd are not equipped to handle the additional traffic. Already, the traffic hold ups to exit the freeway from residential traffic ALONE is enough to create notable problems. I cannot begin to imagine how much more cumbersome this would become with commercial traffic as well.

The close proximity of a commercial building built next to enormous residential communities such as Fairway Canyon and Tournament Hills is outrageous, in my opinion, especially at such a time when property values are starting to increase in this neighborhood. This is extremely beneficial to the area and Beaumont as an upcoming city. This town went from being practically nothing to becoming SOMETHING when the market crashed and now that we are starting to stand on our own feet again, you threaten to take this away from us again, by proposing the construction of such a warehouse which inevitably keep property values low and the area unappealing - and in such a thoughtless manner.

If Riverside county wants to look out for the interest of their cities and inhabitants, it would be wise to keep such a monstrosity from the hills of Cherry Valley and from the residents of Fairway Canyon and Tournament Hills.

A concerned citizen,

Heidi Miccio

Jan. 29, 2014

Paul Rull
County Planner

Dear Mr. Rull-

I am a resident of Cherry Valley, Calif., and am writing to you to express my strong objection to the Gateway Project whose goal is to bring a distribution center to an area as pristine and peaceful as Cherry Valley.

I am deeply concerned about the harmful and irreversible impact such a project will have on the area, the way it would exacerbate air pollution, increase noise levels, and worsen the traffic situation, and how it will utterly ruin our way of life, plummeting property values in the process.

One of the most beautiful drives in the area is the very area being targeted for the giant warehouse. Currently, driving on Cherry Valley Blvd. is a wonderful experience — the kind that is getting increasingly harder to find in Southern California. Such areas need to be cherished and protected. They need to be left untouched for our children and grandchildren. The introduction of a monstrous warehouse would be, you will no doubt agree, disruptive in every sense of the world. It would be a gross misfit for a region like Cherry Valley and an unattractive eyesore.

I urge you, therefore, to exercise all your power to ensure that the Gateway Project gains no further traction, and that Cherry Valley Blvd., and the idyllic land it runs through, be left as they are.

Sincerely,

Iqbal Pittalwala

Opposition to the Gateway Center project in Cherry Valley

From: Jennifer Rose Booth [jenandjames@gmail.com]
Sent: Sunday, January 26, 2014 7:02 PM
To: Rull, Paul
Subject: Opposition to the Gateway Center project in Cherry Valley

Mr. Rull,

As a residents of Beaumont, we would like to express our opposition to the future building of the proposed warehouse on Cherry Valley Blvd.

First, the amount of trucks is a major concern for our family. As we attempt to exit both eastbound and westbound daily, we have to wait 3-7 minutes to even get onto Cherry Valley Blvd due to the large amounts of traffic. The sheer number of cars, let alone truck traffic is already a huge issue for Beaumont and Cherry Valley residents. If the proposed warehouse is to have 400 plus docks then that means hundreds of trucks will be passing through our on and off ramps daily.

This will lower our property value significantly. This area is just recovering from the low, low property values. This leads to our second reason for opposing this warehouse. Having a 2.5 million square foot warehouse within a few miles of our home would not appreciate the value of our home. Finally, all the trucks would cause pollution in the air and on the streets.

We strongly urge you to reconsider this project and the deep implications it would have.

Sincerely,
James & Jennifer Booth

Subject: Possible 2.5 Million Square Foot facility in Cherry Valley
Paul,

I am writing you on hearing that a 2.5 million square foot facility is being considered in Cherry Valley, I would hope that you would consider putting this facility down the 60 corridor with the other facilities that exist. As I have lived in Cherry Valley most of my life it is a small community that would be severely affected by such a building. Cherry Valley Blvd. is already impacted by the housing development on the West side of the 10 freeway with the addition this distribution center this would not only impact the freeway on and off ramp it would push the congestion back to the main road through Cherry Valley, which is Beaumont Ave. This is also where the local high school resides. Not only would there be a traffic problem, the pollution levels that would increase from the distribution center as well as the pollution from the Tractor Trailers themselves are a detriment to our community. With all of previously listed concerns, these factors would cause a dramatic decrease in property value. Cherry Valley has traditionally been a residential area, this would cause a higher level of industry into a residential area which never bodes well for a community. Now I am not saying that this facility should not be built, but it would make more sense to be put with the other facilities that are in Beaumont off of the 60 freeway corridor or the 60 corridor in Moreno Valley where the infra-structure is already put in place.

Thanks for your time,

Best Regards,

James Honeyfield

Paul,

I understand you are the County Planner and you are considering changing the zoning to allow a huge warehouse to be built north of Beaumont with access off Cherry Valley BLVD. The first thing I would like to know, is this true? If not then sorry to inconvenience you. Now if this is a possibility there are some thing you may want to think about. I travel on Cherry Valley to the 10 FWY, there are already quite a few vehicles on this road. I think it is important that we have industry here here in Beaumont but it is more important we have a master plan for our growing community. I occasionally drive by Temecula and you can tell they did not have a plan when the started to grow, there is a mile back up on the fwy just to get off the fwy. Most all the streets are congested, it is a real pain in the butt to drive around in that town. Now on the other hand take a look at Rancho Cucamonga, they have done a pretty good job making sure the new development is all conforming and all industry is close to fwy access and away from residential. Your decision today will impact this community fro generations to come. I feel this town could be the next big real estate boom but it must be done right.

Thank you for your time,
Jeffrie Saenz

Subject: Proposed warehouse in Cherry Valley
Mr. Paul Rull,

Thank you for taking time to read this email. I reach out to you this afternoon to express my worries about the proposed warehouse off of Cherry Valley Blvd.

I have lived my whole life in Cherry Valley, a wonderful rural area that has been preserved as such for decades. My concern is that if this warehouse goes in, it will destroy the rural setting that many, such as myself and family and neighbors have enjoyed for all these years. The pollution that will be emitted from the construction project and the hundreds of trucks going in and out of the warehouse daily will be detrimental to the atmosphere here and ruin the many orchards that residents have cared for for years.

There is already so much traffic on the blvd due to the new high school that was put in in 2007 and with a one lane on ramp and one lane off ramp to the I-10 will cause a huge disaster in terms of traffic. A quick zip to the freeway that so many of us have enjoyed will now turn into a half hour struggle to travel but a mile or so. Home values will decrease and Cherry Valley will turn into a thing of the past.

There are plenty of other places in Riverside county that would better suit a warehouse of that caliber, for example out past Cabazon and continuing on to the desert cities that have easy access to the freeway. Construction there would not have a devastating effect on a community as it would here.

I urge you to reconsider your options and not to build on Cherry Valley Blvd.

Subject: Gateway project

Mr. Rull,

I would like the county to reconsider the building of the Gateway Project in Cherry Valley. We live in a rural, peaceful area that does not need to be transformed into a mini Fontana. The location that the county has proposed is not appropriate for our standard of living. We live and have purchased homes in Cherry Valley and Beaumont to get away from the city. Do not bring the city to us; especially in the form of a monstrous distribution center. We are Cherry Valley, not Cherry Industry.

I am concerned about the pollution and the air quality. I am concerned that you will be marring our beautiful landscape that makes Cherry Valley what it is, with a an enormous warehouse that nobody wants or needs. The traffic on Cherry Valley Blvd. will be horrendous! We do not want two hundred tractor trailers trying to get off the freeway and down that street. Beaumont High School students are on that street, as well as all of the homeowners on the south side of the 10 freeway.

Please take your business elsewhere. Your plan is disruptive and unwelcome to the citizens of Cherry Valley. Build your ugly warehouse in Moreno Valley or Ontario.

Thank you,

Jill Padilla

Subject: Gateway Project

Mr Rull

We have just found out that there is a 2.5 Million sq. foot warehouse project being proposed for our area. This is not the right place for a huge warehouse to be built. We do not need these trucks polluting our air space in our small community. There are 4 schools nearby, along with housing tracts and 2 senior communities. Cherry Valley Blvd. is a road we all travel to get both to and from the freeway, and the road is already quite worn and the overpass is quite small. With hundreds of trucks using the freeway on and off ramps every day, this will greatly effect our residents travel. There is a high school on Cherry Valley Blvd., and an elementry school on Brookside Dr., both close to the proposed warehouse. Our children do not need these trucks! Besides the pollution and traffic from this huge proposed warehouse, it will lower the property value of our homes even more, and we have already taken a hit with the down economy We seniors do not need --- nor do we want this project in our small community.

Subject: RE: Cherry Valley Interchange....

Thank you. From my meager experience as a public works construction engineer I don't find much wrong with the proposed use of that property. Provided there are adequate measures taken to handle ingress and egress traffic related to the I-10, I don't see much of a threat. As long as traffic issues and storm drainage off of that property are addressed, I don't have any initial concerns. That whole thing about 480 bays and 480 trucks is to me mere scare tactics for the uniformed. There is more to this yet. My view is that commercial use of what used to be fallow land could be a good thing. Certainly, if this goes forward that land will not be used for residential development. What I would be seeking would be restrictions on support services in and around this proposed site, other than fueling facilities. Them truckers should have to go to Calimesa or Beaumont for food and lodging. I guess I am an advocate for having a commercial corridor along the I-10 that produces income for the local economy but protects we residents in our chosen environment.

Hi John,

Please find attached a copy of the notice of preparation as it will give you some project details, including the project location map. The project is located on the north side of Cherry Valley Blvd, east of the I-10, west of Oro Road.

If you have any questions, please feel free to contact me.

Thanks.

Attn: Paul Rull, Project Planning Manager for Riverside County

Dear Mr. Rull,

I've just learned of this project and the meeting scheduled for today 1/27/2014 at 1:30pm. I cannot attend in person but wish to let you know of my concerns about this project. Having just heard of the project I recognize I am late in becoming aware, but wish to record some early thoughts and concerns;

- Plans for 428 truck bays in use 24 hours per day is an astounding load on the I-10/Cherry Valley interchange.
- The volume of trucks will be a very large source of particulate and noise pollution.
- Fast Track status seems inappropriate for a development of this size and impact in an area previously intended for residential use.
- A far better location for this and similar logistics facilities would seem to be at the currently planned Portrero interchange; a location seemingly better suited.

I request that you keep me informed of this activity as it progresses via email to johneclark936@msn.com or regular mail to John E Clark, 1572 Summerlin Ct. Beaumont, CA 92223.

Thanks in advance for bringing these initial thoughts/concerns to today's planning meeting.

Cherry Valley warehouse proposal

From: Judi Nightingale [judinightingale@yahoo.com]
Sent: Monday, January 13, 2014 8:00 PM
To: Rull, Paul
Subject: Cherry Valley warehouse proposal

Mr. Rull,

I ask you to please consider the impact to the small and rural community of Cherry Valley as you consider the proposal for a huge warehouse to be built at out off ramp. I moved to Cherry Valley, from the country club area of Redlands, just over a year ago. The reason for the move was so that my husband and I could enjoy a rural and more relaxed environment.

Those of us who live in this town, share the desire for a close community and enjoy the small town environment. A large warehouse at the only exit allowing egress into our community will have an extreme impact on traffic and will also lose the country environment we enjoy.

I work for the County of Riverside and understand our need for economic growth but ask that a more reasonable fit be considered for the I-10/Cherry Valley blvd junction.

Thank you,
Judi

Subject: Cherry Valley Warehouse project
Dear Mister Rull,

I know you are being inundated with objections over the warehouse that's been proposed for Cherry Valley. I could tell you what you've already heard so far: that no one wants this project to move forward. That will not be much different from what you are already hearing. And its true. People do not want this facility here, marring the cherished rural environ. However, I know that the bottom line will probably be money. So what I seek to tell you instead that revenue, while important, should not trump the concerns of the community.

The traffic that a facility such as this would produce is unthinkable for the area. The freeway is unequipped for such a massive onslaught of vehicles (trucks no less). The surrounding land is a beautiful and untouched rural treasure. This community's backbone is rural farmland. It is what people DO with their land, it is what attracts people to this area, is what Beaumont boasts about to film crews, the reason many farms and ranchers commit their livelihood to this place.

We cherish our clean air and unpolluted environment. Clean land, air, and water are a sovereign right of the people, much overlooked and belied by corporate interests, who do their dirty work far from where they themselves live. That these rights would be sacraficed in the name of speculative consumerism is unjust, but also reflects poorly on you personally. Your position is to protect Riverside county and preserve its assets, as well as enable growth and industry that properly reflects the values of the community. Cherry Valley values its rural farmland and unpolluted environment first and foremost. That is why it is home of a very large organic farm and resort, as well as ethical and eco friendly farms and ranchers. THAT is what we are doing here. The potential pollution (air, noise, light, water, etc) this building may generate is of HIGHEST CONCERN to a variety of agricultural industries.

There is a water shortage here as well, and water must be a very carefully managed resource for this area. Should it be negatively impacted by the construction and later by the water usage of the facility, its employees and never ending truck drivers coming and going, this building could destroy any value it promised.

I moved to this community only a few years ago from Riverside, and was very involved in the art community there. Over the many years, I watched that part of the city's plan grow and evolve. Being part of the city's first artwalks, when there were only a handful of galleries and attendees, I glow with pride seeing how vital the arts community has become to Riverside's identity today. And because of this I know how imporatnt it is for a city to invest in projects that have deeper merit than simply revenue. Nurturing smaller, individual projects that bear unique products and services is, in the long run, what really builds a place into a thriving community that people want to be a part of. Attending to the subtler details and needs of the people is central to civic moral, which equals participation, which is the engine of the city's economy. Just look in 10 years what the arts has become in Riverside, how important it is. No one wants to live in a community famous for strip malls or for a monolithic industrial monstrosity. They want QUALITY. Substance. Culture. Ultimately this is what wins out and carries weight into the future. This industrial complex promises none of that.

I'm sure the county stands to profit from this creation, but will Cherry Valley see the money it will generate? If not, there is NO REASON it will be accepted. The will of the people is often no competition for money. But you must know, as the person who is in charge of envisioning the future of cities, that the citizenry of Cherry Valley will be HARMED by this action. It is not a petty concern. **It is about the way we see our future, how we treat our land, what we value and uphold as a community.** It stands for much much more than the money temporarily got from such an unsanctioned trespass.

PLEASE, as one of the only people who truly represents our local community and has the power to affect positive change here, heed our objections. Place our concerns at the forefront of your deliberation. Our quality of life depends on it. Thank you! We appreciate your hard work for us.

Sincerely Yours,

Kim Knorr

Subject: Proposed Warehouse Project Cherry Valley

Dear Mr. Rull,

I live in Cherry Valley and am very concerned about the possibility of the proposed warehouse project on your agenda today. We have lived in Cherry Valley over 30 years and have watched the communities around us grow without benefit of change to infrastructure such as roads. Because traffic has increased on Cherry Valley Blvd, people cut across the city on the two main East/West cross streets, Brookside and my street Orchard. It has become so dangerous on our street we no longer can park our cars there. Last year we had a fatality on our street which was tragic. As happens several times a year, just this last weekend someone ran head on into the barrier on the Cherry Valley on ramp to the 10 freeway. The addition of 400+ truck loading bays is just unfathomable to me, and I cannot see how the area could support it.

The community here has had to shoulder the increased traffic load from housing expansion for too many years now. In addition, the pollution and noise of such a facility would greatly affect the quality of life here in this rural area.

Please, please reconsider this monstrosity of a project which would forever alter our quality of life here in Cherry Valley.

Thank you!

Subject: Gateway Project 2
ATTN: Mr Paul Rull,

This email / letter is in regards to a project referred to as 'Gateway Project 2' that is in the planning stages and to be located in Riverside County off the 10 freeway at the Cherry Valley Blvd exit near Yucaipa / Beaumont / Cherry Valley. This email is written to express clear adamant opposition to this project.

It has come to my attention that this project is designed primarily for the purpose of warehousing retail / consumer products / household goods; and more specifically designed as a 'high-cube' logistics facility. This Heavy Industrial type of project CLEARLY does not fit in this rural area; nor does the project's proposed use fall under the existing zoning for this community.

The Environmental Impacts for this type of project are clear and irrefutable; increased pollution, displacement of wildlife, diminished air quality, excessive demand on a water supply that is already scarce and depleted for current residents, lowered property values, and extreme truck traffic not to mention the life threatening hazardous mixture of heavy industrial trucking with residential traffic. There is absolutely no benefit this type of project could bring to a residential / rural area that would outweigh the detriments. Cherry Valley is an area currently known for it's fruit orchards, scenic beautiful landscape, beauty, and serenity, not at all the type of community for this proposed project.

It is obvious that this project is nothing more than a power play; more power to the already wealthy and who cares about the John Q public. The planning, or lack thereof, for this type of project in this area does not qualify whatsoever as a 'Planning for our Future' project; nor does it in any way 'Preserve our Past'.

Please accept this email / letter written by an official Registered Riverside County voter as a **NO** vote on this project.

Sincerely,
Kirk Brown

Gateway project in Cherry Valley

Subject: Gateway project in Cherry Valley

Please note that this area is a rural family area and is not conducive to the facility you are planning to build. Truck traffic is already heavy and the freeway is only 3 lanes wide. Most, if not all, moved here to get away from heavy traffic and have a more peaceful way of living. Please think about what you are proposing and how it would affect this quiet community. This is not the place for a massive facility and many trucks coming and going. There is plenty of space along the 60 freeway if you are looking for land that would not affect residential areas.

Thank you for your time,

Mrs. L. Montoya

Subject: Gateway Center Project

Dear Mr. Rull,

I am a 25 yr. resident of Cherry Valley and I am very much apposed to the Gateway Distribution Center project. The destructive impact on our community and on surrounding communities will be multifaceted; Traffic congestion at the freeway on and off ramps, diesel fuel pollution, lower property values in the whole area of Beaumont, Calimesa and Cherry Valley. Most of us have chosen to reside here because of the rural lifestyle, lack of congestion and "usually" clean air, this project would certainly ruin that and its not necessary! no one needs a distribution center in this area and it will in no way benefit the area residents. As usual the project planners are trying to fly under the radar but people out here are becoming aware and they are angry and very soon more will be aware and angry!!
Please feel free to let Supervisor Marion Ashley know that we really don't appreciate this irresponsible project and any involvement he has in it other than assuring its demise.

Sincerely,
Lance Adams

Subject: The Gateway Project

Dear Paul,

I am writing to you in regards to the Gateway Project that's being considered for the small community of Cherry Valley, CA.

It is extremely important that you stop this project from invading our little community. They plan to build it on Cherry Valley Blvd.

We use Cherry Valley Blvd. as a major thoroughfare to the I10 Freeway. This community cannot handle a warehouse with 428 loading docks and all of the trucks that will be clogging up our on and off ramps.

We use these ramps to get to and from work every day. It would be a hardship if we had to drive up Beaumont Ave. to enter the 10 Freeway! It's in the opposite direction to where we need to go.

Please I ask you, to stop this from happening? There is plenty of other area's a warehouse of that magnitude can be built and not have such a major impact on the hard working people that need to get to work each day!

Why don't they choose a commercial area?!!!

Not to mention the air quality we would have if these trucks come here. Would you want your family to live in an area with all of that diesel fuel? Cherry Valley is a wonderful little community and we would like to keep it that way and this type of development is NOT welcome here!

Yours truly,
Larry and Pamela Bunker

Subject: No Gateway Project Please!
Dear Paul Rull,

I am writing to plead with you to please not go any further with the gateway project in Cherry Valley on Cherry Valley Blvd. I live just a couple miles from this proposed project, and we moved to Cherry Valley to get away from all the trucks and smog of the city. I have small children and we have a lot of allergies and this project would increase pollution in our charming country town. The city of Beaumont already shut down one huge distribution project proposed off the 60 and 10 fwy last year because our people didn't want it.

Please conserve our city and go in a different and more family friendly direction. Beaumont and Cherry Valley is one of the fastest growing cities in Southern California for families, and we chose this area for it's views and community. Please, I beg you, stop this HUGE project and re-think our county's development! We don't want the congestion and everything that comes with a busy industrial area here in these beautiful foothills.

Sincerely,

Lyndsey

Subject: Gateway Center
Mr Rull,

I have been reading about the proposed project known as the "Gateway Center." I am adamantly against this project bring built in, or anywhere near, Cherry Valley. This proposed warehouse will have many negative effects on this area.

1) It will ruin traffic on Cherry Valley Blvd, and make the on and off ramps unusable for regular traffic. 428 bays will generate thousands of trucks daily, at all hours of that day and night. It could very well generate traffic to the tune of a hundred trucks an hour. Cherry Valley Blvd will become nothing more than a throughway to the warehouse.

2) t will foul the air horribly. Diesel emissions are now know to be the worst. Read this study if you care to educate yourself. http://newscenter.berkeley.edu/2012/10/22/diesel-vs-gas-contributing-to-smog/

Thousands of trucks per day ... idling and driving ... spewing out diesel emissions ... will ruin our standard of living, making it difficult for our elderly and our children to breath.

3) It destroy our home values. You may not live around here, but we do. We didn't move out here and buy homes only to have their values decimated because of some giant warehouse monstrosity.

I, as well as everybody else I know, will fight this tooth and nail. I suggest you talk to your superiors about moving this project to another location. It will save them a lot in litigation fees and bad press.

Thank you for your attention to this matter.

Dear Mr. Rull,

Hello, my name is Marina Lim. I'm a resident at Fairway Canyon/Tukwet Canyon off Cherry Valley Blvd in Beaumont, Ca. I read post that my friend posted on facebook about a proposed Warehouse. Now, is this true? If so, I'm truly concerned for my family's well being. We moved from Rancho Cucamonga to Beaumont in 2005 to raise our family in a nice, peaceful, stress-free and clean atmosphere. Also, away from the trafffic and loud noise. I object to this project. Anyway to address my concern in person?

Not only that, my home value has decreased when we purchased in 2005. It will be even more lower if they do build a warehouse. Nothing good will come out of this for my family and other residents. Thank you.

Regards,
Marina Lim

Sent: Sunday, January 26, 2014 8:57 PM
To: Rull, Paul
Subject: Fw: Gateway Project
Dear Mr. Rull,

My name is Marshall Cammack and I am a resident of the city of Beaumont. I am writing to you today to state that I do not want the warehouse to be built on Cherry Valley Blve. (Gateway project).

This is a "top tier" size distribution center. I was a manager at a distribution center in Ontario, CA for three years so I know what this project entails and will it bring to pass. As you know, the Ontario area is pretty much all distribution centers. Ontario can pull this off because it has the infrastructure in place to expand and plan for new growth. Multiple lanes and freeways, wide roads, etc. Proper road engineering and planning. All of the freeway exits around Beaumont, especially the Cherry Valley exit are simply not built for heavy truck traffic and will face infrastructure failure very quickly. Re-construction would have to take place as the ramps, bridges, and roads are old and not meant for the hundreds of heavy truck loads that would ride them every day. I'm sure you know how damaging trucks are to roads and bridges compared to cars. Traffic on these roads right now is very light anyway so who knows how long this old infrastructure will last with increased traffic.

Environmental concerns are obvious. People move to Beaumont to avoid the pollution other cities have. Ontario, San Bernardino, Fontana, etc. When we moved to Beaumont from Ontario I couldn't believe how beautiful the sky was in comparison to Ontario and the surrounding areas.

The last item I would like to address is the way this would devalue property values around the area. Some of the nicest homes in Beaumont (Fairway Canyons, across the freeway from proposed site) would have the values of their homes seriously decrease. It doesn't matter if it's across the freeway or not, home values will still go down. The proposed area is also a very nice, scenic area for drivers and those visiting the community. That's why there is a "Cherry Valley Festival", it is close to Oak Glen, etc. Let's be serious, would you really want this being built down the street from your house? The image of Beaumont will also be tainted as people who drive by will only remember the huge warehouse off to the side of the road rather than the beautiful scenery.

PLEASE CONSIDER THIS IDEA:

While this building would devalue the Beaumont area it would most likely increase the value of certain areas of the Banning area. I am very serious when I say that a facility of this sort would increase many areas in Banning and I think it would be something good and "new" for the community. New, large, development hasn't happened in Banning for a long time and I am almost sure that this would be a boom for the city bringing in new tax revenue, something the city desperately needs.

I appreciate your time and understanding.

Subject: Proposed Gateway Project in Cherry Valley

Hi, Paul

I just became aware of this project two days ago. As a resident of Solera Oaks, a 55+ community in Beaumont, I am extremely concerned over the negative impact this project would have on the quality of life in our area. First of all I'm surprised that residents weren't notified by Riverside County and given the opportunity to voice their concerns. If I wasn't going to be out of town, I'd attend Monday's meeting.

My primary concerns are:

- Environmental impact, in particular air quality. Diesel trucks are the number one polluters for fine air particles that put seniors and children at risk. I don't want Cherry Valley to become the next Mira Loma!
- Rezoning from residential to industrial opens the door for like projects.
- Increased traffic on Cherry Valley Blvd and freeway on and off ramps.

I'd like to request that my name be put on the notification list for information regarding Gateway. Send information to:

Martha Saenz

Riverside County Planning Department

RE: Comments for Public Scoping Meeting January 27, 2014
SCH No. 2014011009, NOP for I-10 Gateway Center Project

FROM: Martha van Rooijen, Beaumont, CA

This email is to submit comments for the Scoping Session being held today at 1:30 on the I-10 Gateway Project.

My understanding is that General Plan and Zoning Changes are being considered for this project.

This land-use application should be denied by Riverside County for the following reasons and significant negative environmental impacts. Cherry Valley deserves better than this poorly conceived, environmentally unsound warehouse project.

1. Cherry Valley is part of the Riverside County Pass Area Plan and is listed as a "unique community"

2. Cherry Valley residents have spent years working with Riverside County on the appropriate General Plan, Zoning, and Overlays for their community.
Warehousing, including logistic and fulfillment centers are inconsistent with the current and planned land uses in the proposed project area. The area itself is vacant and in a rural setting surrounded by small farms and rural-type estate residential. The area has large minimum lot sizes and is intended to preserve the Cherry Valley coveted rural lifestyle.

3. Cherry Valley Gateway Policy Area is in place and shows the following for the "Gateway" to Cherry Valley. The proposed warehouse I-10 Gateway Project is not consistent with what the approved planning document is for this area. Here is what the Plan states is consistent, buffering and rural aesthetic gateway features--not big-rigs, warehousing, pollution, visual blight and noise.

   The Cherry Valley Gateway Policy Area is located at the westerly edge of the community of Cherry Valley in an area that is presently largely agricultural or undeveloped. The policy area shall be developed as a gateway to Cherry Valley, and it shall be developed to evoke the rural character of that area. The policy area shall also serve as a community separator between Beaumont and Calimesa. To accomplish these two goals, it is envisioned that clustering and buffering will be utilized in order to preserve open space and maintain the rural character of the area. Higher densities may be allowed through a general plan amendment provided such development meets the goals of the policy area.

   Policies:

   PAP 4.1 Clustering of dwelling units and lots is encouraged in order to preserve open space areas.

   PAP 4.2 Provision shall be made for establishment of a visible "entrance" feature for Cherry Valley within this area that evokes the rural identity of the community.

4. All of the following environmental factors are significantly negatively affected by the proposed I-10 Gateway Project:

   a. Aesthetics--the project will cause visual blight and ruin the rural character of Cherry Valley

   b. Biological Resources--there are animals, flora and fauna that will be affected and destroyed

   c. Greenhouse Gas Emissions--Warehousing and the associated big-rig trucks, workers and machinery will emit greenhouse gases that are not currently in this pristine rural environment

   d. Land-Use Planning--Warehousing is 100% out of compliance with the existing land uses, planning designation and overlays that the Cherry Valley community has worked diligently with Riverside County to have in place. The existing land-use regulations are in place to specifically prevent the type of planning application that the I-10 Gateway project is proposing. A speculative warehouse scheme with massive density and environmental impacts changing quality of life in the small, unique Cherry valley area.

   e. Housing---the area is meant for estate, rural housing and small agricultural uses--all on large lots--warehousing will impact the existing homes and small farms and in fact, prevent further development of the rural housing--when people see giant warehousing, big-rig trucks and associated impacts, they do not want to invest in the Cherry Valley rural lifestyle--they believe their investment will be wasted. So it is not just the current residents who are affected, it is the future small farming, equestrian and estate home builders who will not want to be located in a warehouse zone. I must bring up the Sketchers Warehouse in Moreno Valley--it is a travesty that turned a rural estate area into a visually blighted mess.

   f. Transportation/Traffic--Traffic is a prime concern. Neither Cherry Valley or Oak Valley I-10 onramps are widened or signalized. Traffic backs up from the existing land-uses. Cherry Valley on-ramps have severe visibility issues, are not configured well now--adding in big-rig or warehouse trucking will cause accidents and insane traffic back ups. Even if this developer is required to pay a fair share of the needed interchange upgrades--signalization, lane widening, new ramp configurations with appropriate acceleration lanes on I-10, etc.-- the improvements MUST be in place prior to any warehouses being developed. People say, well it's in the plan and a fair share will be paid. Unfortunately, the intersection is too under-sized and dangerous at both Cherry Valley/I-10 and Oak Valley/I-10 to count that a future Caltrans project will mitigate traffic/transportation concerns. The existing housing that was approved by Riverside County in the Oak Valley area has been built and more is planned, and still the two Interchanges are not on schedule for upgrades or even signals. The back up in the morning and night with just the existing traffic today is a cause for concern.

   g. Agriculture--the area has agricultural uses. Warehousing is not consistent with the area's agricultural, small farm-to-table concept.

   h. Cultural Resources--the Edward Dean Museum is within Cherry Valley. In addition, Cherry Valley serves as a rural gateway to the small hamlet of apple orchards and rural estate homes in Oak Glen in San Bernardino County. Warehousing impacts the cultural resources in Cherry Valley that preserve living pieces of California rural lifestyle. There may also by significant Indian artifacts and other cultural items found in the area that will require sensitive treatment and a high-level of consideration by both Riverside and San Bernardino County historical/cultural groups, as well as potentially having statewide significance.

   i. Hazards and Hazardous Materials--Warehousing is Industrial and will potentially bring

chemicals, processes, pollution, and waste products to Cherry Valley that are significantly negative for the environment.

j. Public Services--Cherry Valley does not have adequate police or fire services now. Riverside County is spread thin in these resources. Adding warehouses to the Cherry Valley area will require additional police and fire services that are not needed now. The developer of the warehouses is just a speculator who will leave--will there be conditions for a Mello Roos/Assessment District that they pay for their share of added services. Will the County expect the warehouse to pay for its impacts to public services? The administration for Cherry Valley is not close to Cherry Valley-warehouses are working and operating 24/7. There is a significant impact on public services to create an island of warehousing in a rural area.

k. Utilities/Service Systems. Cherry Valley is rural. Are the warehouses planning on underground utilities? They should be. The existing grid is older and not a modernized system in Cherry Valley. Warehouses require power and utilities 24/7. In addition, warehouses draw in other land uses such as truck stops, diesel fuel--the warehouses may even put onsite fuel and truck parking that could become a default truck stop--with or without fuel. The reason is that we have seen big-rigs pulled over for months on I-10 as Caltrans has closed the rest stop in Beaumont area--it is not clear if the closure is permanent or for maintenance. However, the trucks that were stopping there are now just pulling over for hours to rest. Will the I-10 Gateway project become a defacto truck stop--it is entirely possible that this will happen as it will be an attractive stop for truck drivers.

l. Air Quality--Big problem with air quality. Cherry Valley now enjoys fairly clear air with good quality--associated with rural living. Intermittently, pollution comes from Los Angeles, San Bernardino and Riverside and from the Coachella Valley now. There is no warehousing in the proposed project area in Cherry Valley--the warehouses will create new air pollution, new emissions that will damage the Cherry Valley residents in the rural area and residents in Beaumont and Calimesa nearby. The area will be a magnet for Big-Rig trucks and many will sit in the parking lot generating emissions. The Big-Rig and smaller trucks will sit idle waiting to get on the inadequate freeway on/off ramps on I-10 at Cherry Valley and Oak Valley.

m. Geology. The soils are pristine in the Cherry Valley Area--emissions, oil and other warehouse/trucking impacts could leak into the soil and affect neighboring rural homes and farms.

n. Hydrology and Water Quality. Water Quality is a big issue for Cherry Valley. There are studies that new water supplies must be found for the existing land-uses and rural plans. Warehousing is not compatible with an area that has water quality concerns. It is noted that Yucaipa Valley Water District will serve the development. Interesting that Beaumont-Cherry Valley Water District is not serving. Beaumont-Cherry Valley Water District has been clear that water supplies are limited, conservation is needed and development may not occur if new water sources are not identified and put into place. Now suddenly enter Yucaipa Valley Water District--they are willing to serve. This is smoke and mirrors. Beaumont-Cherry Valley District should be consulted along with San Gorgonio Pass Water District who brokers water in the region before any warehousing is considered in this area. A water study is needed. The area also has a natural water shed that will be impacted by the warehouses.

o. Noise--warehouses go 24/7. They will bring noise pollution to our region

p. Light/Glare--Warehouses go 24/7. They will bring light pollution to our rural region. City of Beaumont has a Dark Sky Ordinance. Cherry Valley may not have this kind of protection. It is needed. The County of Riverside should consider the effect of a 24/7 warehouse operation on the night skies and surrounding rural land-uses.

5. Expand the Notice to Responsible Agencies for the I-10 Gateway Project in Cherry Valley.

    a. Riverside County needs to add the following agencies to the Noticing this project for the NOP and as Responsible Agencies, if they have not already done so:

        i. City of Beaumont

        ii. City of Calimesa

        iii. City of Yucaipa

        iv. San Bernardino County (Oak Glen Community Planning)

        v. San Bernardino County Board of Supervisors

        vi. Beaumont-Cherry Valley Water District

        vii. San Gorgonio Pass Water District

        viii. San Bernardino Valley Municipal Water District

        ix. Yucaipa Valley Water District

        x. Riverside County Parks and Recreation

        xi. San Bernardino County Parks and Recreation (related to Oak Glen)

        xii. Beaumont Unified School District

        xiii. Caltrans District 8

        xiv. Wildlands Conservancy

        xv. Southern California Edison (SCE)

        xvi. Southern California Gas Co (SGC)

6. Please add me to the notification for this project--public notification or for those interested in actions on the I-10 Gateway Project in Cherry Valley.

7. Finally, Cherry Valley and the surrounding areas deserve a better Gateway Plan for this region than a large-out of scale, out of place, polluting, noisy, traffic/Big-Rig Generating warehouse project that is nothing more than a speculative venture by out-of-town developers. The region deserves monument signage, land-uses and public improvements that celebrate the rural, estate housing, farm-to-home, and rural-service and rural-tourist lifestyle that Cherry Valley stands for, and has always stood for. Warehousing is a tragic development in one of the last places in the Inland Empire that has remained and wants to remain close to its rural/agricultural and local, home-town roots.

Sincerely,

Martha van Rooijen

Attn: Paul Rull, Project Planner

Response to NOP of a DEIR for: I-10 Gateway Center Project:

The first item of concern is that a General Plan Amendment from Community Development: Very Low Density Residential and Rural to Industrial should not be allowed simply because a developer wants to build something that is not allowed by the current zoning. Why have a General Plan at all if it can be changed at the request of a developer? If a developer wants to build warehouses -- let him find property that is zoned for that and leave other areas already designated as Low Density and Rural alone. The DEIR must show sufficient reasons why the applicant is not pursuing the project in an area where it could be developed by right. This is the only way that there can be meaningful public review and comment on the selection of this site. Just because it is close to a freeway should not be a sufficient reason. The DEIR needs to explain how the new requested zoning change differs from the original zoning and then list justification for these differences. The DEIR should also include a section explaining why this project might or might not be considered "spot zoning" as well as an analysis of the incompatibility of the proposed warehouse with the adjoining low density and rural uses. Ignoring zoning ordinances is a violation of CEQA.

Then we have the size of the building. Two industrial buildings of approximately 2,560,000 square feet in a previously pristine open area is a horrible idea. These two buildings will cover almost 171 acres of the site leaving a mere 74 acres as open space. What good is "open space" around a "high-cube" logistics center that will be 47 feet high?

Finally there are the grading activities on the site which consists of moving 6 million cubic yards of material. If that much dirt has to be moved to build a project -- then that project is in the wrong place. Building this warehouse

on this site should not be approved for this reason alone.

I am glad to see that there will be no environmental topics screened out from review in the DEIR. Of course that doesn't mean that there will be adequate and feasible mitigation measures for all the impacts to the environment that this project will necessitate. Certain environmental issues are more important that others and need more than the usual cursory study. I have listed them below.

Air Quality: Under CEQA the significance of a project's impacts to localized air quality must be viewed in context, as the "significance of an activity depends upon the setting." Thus the significance of any added pollutant emissions must be judged in the context of an air basin that already exceeds health-based federal air quality standards. (*Kings County Farm Bureau v. City of Hanford 1990)* The South Coast Air Basin is well-documented as having the worst air quality in the nation. Riverside County generally receives the worst possible grades for pollution related to ozone and ranks #1 for high ozone days as compared to other metropolitan areas. (*www.stateoftheair.org)* The county also has the fourth worst particulate pollution problem in the entire country. (*American Lung Association, State of the Air 2011)* It has long been known that the addition of diesel particulate toxicity dramatically increases carcinogenic risk. Components of diesel exhaust, are of particular concern because they can penetrate deeply into the lungs bypassing the body's defenses. All of this must be addressed and studied in the DEIR.

The DEIR must also address "sensitive communities" that will be affected disproportionately by the increase in pollution that is a natural result of warehouse development. Research has shown that the elderly and other target groups are often exposed to unhealthful air more frequently and at higher levels that other groups. (*Hall and Brajer report p.22-23*) Identifying these communities is an essential part of describing the relevant CEQA setting.

The DEIR must also analyze how the health of the residents of these "sensitive communities" would be expected to be particularly affected. Many DEIR's fail to adequately analyze and disclose the details of the Project's air quality impacts and its true effects on public health. The DEIR

must provide enough information to determine how the health of the most vulnerable people in the region will be affected (e.g., residents of Cherry Valley already living directly adjacent to freeways traveled heavily by diesel-emitting vehicles), or how residents' risk of developing cancer will increase based on emissions from this warehouse.

Greenhouse Gas Emissions: The DEIR must also fully disclose and analyze the impacts of the warehouse project on Greenhouse Gas emissions. California as a whole is facing severe impacts from global climate change caused by these emissions. The available science shows, and state law establishes, that the state must substantially reduce its Greenhouse Gas emissions. Any development must be required to show how the project will address these issues.

Any mitigation measures must be specific, enforceable, and feasible from the beginning of the project -- not at some future date. CEQA demands a full analysis and all feasible mitigation of every significant impact resulting from the implementation of any project. A development must not be approved unless and until it has adopted ALL feasible mitigation measures.

Aesthetics: The proposed design of this structure, including its scale, height, and massing, are woefully inconsistent with existing and surrounding conditions as well as the preservation of views from the adjacent sites. The visual character of this "gateway" will be permanently altered as a result of this project. The DEIR needs to include many drawings and photographic displays to show how the proposed building will appear at full build-out in the context of the existing visual setting. There must be substantial visual evidence to show how these "high-cube" mega-buildings will affect the aesthetics of the surrounding areas. Line of sight graphics from a variety of nearby sites with views of the project must be included so that the county will have a basis on which to determine the Project's effect upon aesthetic resources.

TRAFFIC: Any mitigation measures concerning necessary traffic improvements must be certain and enforceable. It is a violation of CEQA's mandate to indicate that improvements are possible, but may not be constructed until a future date perhaps when county or state funds are available.

Public Services: Does Riverside County have enough police, fire and other public service people to meet the needs of this facility? This question needs to be addressed in the DEIR.

Finally, CEQA requires that there are feasible alternatives presented for consideration that could avoid or substantially lessen the project's environmental effects. There must be a reasonable range of alternatives to the proposed project or to its location, that would feasibly attain most of the project's basic objectives while reducing or avoiding many of its significant environmental impacts. Each of these alternatives must be seriously evaluated and discussed in the DEIR.

One final comment. By "fast tracking" this project, some of the opportunities for public input are not available. This is a great disservice to the residents of Riverside County. Also why do we even have a Planning Department if developers are allowed to sidestep that very important evaluation of their building plans. Aren't the planning department people supposed to be the experts on building plans? Shouldn't the county supervisors have the benefit of what those experts have to say about this particular development? A project of this magnitude needs more than just a rubber-stamp from the county supervisors. I hope that isn't what is being planned in this case.

Sincerely yours,

Mary A. Daniel

Subject: Gateway Warehouse Project
Dear Mr. Paul Rull,

We just heard about the Gateway Warehouse Project in Cherry Valley. We strongly object to this land being rezoned from low density residential to industrial. We feel it will negatively impact the residents in this area especially since it would require major infrastructure to handle the increased traffic and also the obvious diesel pollution.

I am a resident of Solera, a 55+ residential community.

We would like to request to be put on the notification list for any paperwork that is sent out regarding this project.

Our address is 1145 Lantana Rd, Beaumont, CA 92223

Thank you in advance for your consideration,

Michael & Carol Draney

Subject: re: Gateway Warehouse project

Dear Mr Rull,

I am a property owner in Cherry Valley in the County of Riverside and would like you to know that I strongly object to the idea or the plan

of the Gateway Warehouse project. Cherry Valley is a quiet little rural community, zoned one acre per residence for the most part and the majority

of us who would like to keep it that way. We moved away from the air, noise and traffic pollution so we can enjoy our quiet peaceful

community. These people knew the zoning in Cherry Valley when they made their purchase--one acre per residence! This project threatens our

very way of life. There are plenty of locations that are more adaptive for this type of industry--Moreno Valley, Thousand Palms, Coachella, etc.--as you know.

Please stop this project.

Sincerely,

Michele Delph

Subject: Gateway project/Cherry Valley
Dear Mr. Rull,

I am writing in regards to the Gateway project/warehouse slated for Cherry Valley. This is the second time I am contacting you. I don't think that people are truly considering the devastation this project would bring to my community. I moved here because I knew that this was the rural atmosphere I was looking for. I wanted to live where my horses were welcome, where it was quiet, and where I was farther from the pollution of noise, air, and lights. Cherry Valley's residents have fought hard and long to maintain this landscape. Currently, guidelines don't allow for houses to be built on less than one acre. That is what keeps my town charming and calm. We have a small road and an already difficult on/off ramp situation. We do not have the infrastructure to deal with the traffic of semi-trucks, we don't have the water to support this structure, and my health does not have the leeway to deal with the noise and air pollution of a 2.5 million square foot warehouse. My horses would be terrified of constant noise and large machines, not to mention often inconsiderate drivers who don't respect the space animals need.

I hate seeing what people are doing to my area. Razed orange groves and the destruction of open land for our natural wildlife to live their lives. Why would you allow developers from far away who don't love or respect this area to come in and make it ugly and dirty?

We cannot keep doing this.

Please do not allow this to happen.

Sincerely,
Michelle Mahdavi

Subject: Distribution Center

I am a middle teacher in the Beaumont Unified School District. I am deeply concerned over the proposal of this distribution center. I tell my students often how lucky we are to live in the pass area because of the lack of industry and a high density of people. They too share in this joy of living in an area where the air is clean and the city life is far from them. Please consider this distribution center for another location.

Subject: re: Gateway Warehouse Project Help

Mr Rull,

I am a very concerned citizen who lives in the beautiful, quiet, smog free area of Solera in Beaumont. This project is absurd to me and my friends and neighbors. We all moved here from large, noisy, polluted cities to get away from all the health hazards that this project entails and surely bring to the residents here. I am outraged by this proposal and very much against it. I hope my concerns are read and taken seriously and into account when decisions are made.

Gateway Warehouse Project

From: Pat Leahy [pcleahy@yahoo.com]
Sent: Sunday, January 26, 2014 9:55 AM
To: Rull, Paul
Subject: Gateway Warehouse Project

Dear Mr. Rull:

I am writing you to express my concern about the rezoning of the land this proposed project is to be built on. The Cherry Valley and surrounding areas are rural in nature and this is a significant reason many of us bought homes and live in the area.

I use Cherry Valley Blvd. every day, and there is no way the exit from I-10 is able to support the increase in truck traffic this project would bring. The air quality in the Pass can only be negatively impacted by the hundreds of diesel trucks a warehouse this large would bring in every day. Approving this project will surely embolden other landowners in the area to look for rezoning their properties to also build monstrous logistics warehouses, further degrading the quality of life in the Pass.

Please share my concerns with the Planning Commission.

Best Regards,

Subject: Gateway Warehouse Project
Paul Rull – Project Planning Manager Riverside Commission

As a resident of Solera a Senior Community in Beaumont California I am very concerned about the proposed Gateway Warehouse project. As I understand it the Shopoff Company has requested to rezone land bordering the 10 freeway, Cherry Valley Boulevard and Vineland (approximately 274 acres) to build a warehouse. This warehouse will be 2.5 million square feet and used as a logistics center with 428 truck bays that will operate 24 hours a day, servicing diesel trucks. Diesel trucks are the number one polluters of fine air particles that put seniors at risk and as a senior living in a senior community I find this distressing. The proposed property is close enough for me to see from my living room window. Please add me to your notification list.

Patricia J. Gerdine
938 Southwind Court
Beaumont, CA 92223

My name is Patsy Reeley, 10065 Frontier Tr. CV.

I am President of Cherry Valley Acres & Neighbors, A Non-Profit origination in Cherry Valley with membership of over 400 families.

I am speaking in opposition to this project noting the 17 Environmental issues you list plus ones you chose to ignore…such as devaluation of residential property…State water pipes on the northern section of the property… wild life corridor …just to name a few.

You may claim Warehouses use LESS WATER – Wrong! Every truck driver that stops there will Have to use the restroom – 200-250 trucks per day – do the math! That's a lot of water going down the toilet!

I am appalled that this project was "Fast Tracked' by the Supervisors…it goes against everything the General Plan says…. And everything the residents of Cherry Valley worked so hard to obtain as a Community of Interest.

I would hope the Planner and the Supervisors would deny this project……

And lastly – remember this is an election year…

Gateway Project - Cherry valley

From: Bridges [bcbridges@verizon.net]
Sent: Thursday, January 23, 2014 6:47 PM
To: prull@rctlma.org.
Subject: Gateway Project - Cherry valley

This project should not be allowed. This is a rural community, with the main access to the 10 freeway is Cherry Valley Blvd. There is already a difficult freeway access on the west side exit. The additional traffic would cause backed up autos trying to get on the freeway east bound.
The air pollution from all those diesel trucks also needs to be considered. There are large senior mobile home developments less than one mile in both directions. There are a number of these warehouses in upper San Bernardino as well as those on Mountain View exit of the 10 Freeway that are all mostly empty. There is also a warehouse development in Beaumont where the 10 and 60 freeways meet. I cannot begin to imagine there is more need for this warehouse in a predominately rural area. This is a community where many of our youngsters belong to 4H and raise animals. Many of us are horse owners since the area is primarily one acre minimum housing lots. We are adamantly opposed to this project. Take a drive around our community and see the personality of our small community.

Sincerely.
Robert and

To: Rull, Paul
Subject: Gateway Warehouse Project - Cherry Valley/Beaumont

I am writing to voice my opposition to this project and hope you will give serious consideration to denying its moving forward for the reasons listed below.

- First warehouse planned is 2.5 million square feet to be built as a logistics center with 428 truck bays that will operate 24 hours a day servicing diesel trucks that will turnover multiple times like a restaurant table does
- The land next to this is for sale, there is a lot more open land that can be sold for logistics centers turning the area into another Mira Loma.
- Diesel trucks are the number one polluters for fine air particles that put seniors and children at risk and require them to remain indoors during alert times.
- Air does not have fenced boundaries. The Mountain View power plant in Redlands is the worst polluter in Southern California. The air is already degraded, becoming a logistics port would be a death knoll.

Thank you.

Cherry Valley Warehouse

Subject: Cherry Valley Warehouse

I am concerned about the proposed warehouse for The Cherry Valley area.
Is there a petition for residents to become involved so that zoning is not approved for this project?
As a homeowner with a family in Beaumont we are extremely unhappy to find out our air quality and peace will be impacted by the flow of trucks in the area.
Our families quality of life should be a priority instead of these types of proposed projects. A clean safe environment is more important for our children than people looking to make money.
I would imagine many residents buying new homes in the Beaumont area would not have done so if they knew this was a possibility. We wouldn't have.
Thank you for your time,

Subject: warehouse next door

It has come t0 our att. that there may be a 2.5 million sq. ft. warehouse going up next door to our Rancho Calimesa Mobile Home Park in Calimesa, ca. My husband and I live here and would not like this.It would cause a lot of problems for all the seniors living here. Air quality, freeway interchange, aesthetics, lower our property value,would change our rural area into an industrial area. We moved here 6 months ago and would not have if we had known this could be happening in this area. Please reconsider putting this warehouse next door to us. Thank You

Warehouses on Cherry Valley Blvd

From: Robert Vines [rivines@aol.com]
Sent: Sunday, January 26, 2014 4:49 PM
To: Rull, Paul
Subject: Warehouses on Cherry Valley Blvd

Please reject this proposal on behalf of the residents in the general vicinity of this proposed project.

The freeway access is already dangerous enough without the expected traffic from hundreds of big rigs per day. Public Safety will be at risk.

The proximity to Beaumont HS should be another concern.

Air Quality will be effected as well.

The City may gain in some financial way I'm sure, but if the City has to give anything up, such as tax breaks the City will be asking for a costly and long Legal Action in my opinion.

The Public outcry can be heard at this time for anyone who cares to listen.

Kill this project!

Sherri and Robert Vines
820 Annandale Rd
Beaumont/Cherry Valley

This will lower property values in the area as well.

Subject: Cherry Valley Project

I am against further development in Cherry Valley and ask that you reconsider where you put the warehouses.

I have lived in Cherry Valley for 60 years. I stayed in Cherry Valley for all these years because it is rural with little traffic, crime, and has remained a small community ambience. There needs to be some area of our country that remains rural and protected from all that comes with these warehouses. There is room over by the Sketchers warehouse off Highway 60. The warehouse is already there and won't destroy a small community.

We can't accommodate the traffic and accommodate the water demands that this development will bring.

My father built my home over 40 years ago. For the first time I think about relocating. This project could run me out of my hometown. Please consider another location.

Respectfully,
Starla Saiz
Cherry Valley Resident

Dear Mr. Rull,

I am writing to state my concerns about the warehouse and distribution center being proposed for Cherry Valley, Cal.
The first issue of course would be the air pollution. We picked a rural community so that we would not have all the issues that come with the pollution. Second concern for me is the traffic. I drive Cherry Valley Blvd. daily. What are we to do when the Blvd is full of trucks and all I am trying to do is get the kids home from school. Trying to go to work or to the church. I feel there has to be many other options for you to look at.

Thank you,
Stephanie Schlott

Subject: Gateway Center Project
Mr. Rull,

This is something you want your name associated with? Obviously inappropriate on every level, start with the list on the EIR. There is no logic involved here, only greed. This project impacts far more than Cherry Valley, include Beaumont, Calimesa, Yucaipa, to the list.

All involved in this project know it's not what the communities want or need - so who's really benefiting?

Cherry Valley has a rich, unique history and that's why people move here, often being referred to as 'the best kept secret.' What right do any of you have to come and take that away from thousands of residents? This is where we have chosen to live, specifically because it is rural. How about putting the development in your neighborhood and stay out of ours?

If you have a conscious you may understand the negative impact this project will have…. if not, there's still the EIR, legal and other factors to weigh in.

Subject: Cherry Valley Warehouse

Dear Mr. Prull,

I have been a resident of Cherry Valley for over 35 years and I have never written to complain before. I know there is going to be growth and there are going to be issues that I don't agree with. But this planned warehouse complex in Cherry Valley is going to ruin our community.

Why Cherry Valley when there are so many warehouse areas in Banning that are sitting vacant? Areas that have been
earmarked for commercial and warehouses, not areas that are horse property and rural living.

I am a Vietnam veteran and I take pride in where I live, the country that I defended and the countryside that has been my home for over 35 years.

Please take a good look at what effect this warehouse complex will do to this beautiful area or Riverside County.

Yours truly,

Steven Hallbert

Subject: Objection to Gateway Center
Mr. Paul Rull,

Changing the zoning in Cherry Valley is wrong for so many reasons: pollution, an obvious traffic nightmare, noise, pollution off the charts for such an area, and most importantly disrupting the natural beauty of Cherry Valley and destroying the environment in countless ways. The residents of Cherry moved here for the uniqueness of the area, peace where there is little left in Southern California, a better way to raise families, and peaceful retirement for others. Cherry Valley has lost enough!

Regardless of where you live Mr.Rull I am quite sure you would not want such a monstrosity of a development next to your home. If this goes through there will only be more of its type and who knows what else, forever changing the course of a charming community that will be unrecognizable not just to the locals put to tourism as well.

In good consciousness you know this is not the right thing to do. This is not the appropriate area for such development. There are better ways to gain financially that would benefit all, not just 'special interests.'

Then there's the EIR that should put it down as there's no way it should pass in favor of this project.

Riverside's slogan; "Planning Our Future…. Preserving Our Past." I believe 'Our' is meant; we the people that live in Riverside not special interests. How about preserving our past by not eradicating it? Is this something you really want your name associated with?

Subject: Beaumont,CA proposed warehouse
Good morning, Mr. Rull,

I just learned this morning of the proposed warehouse project in the Beaumont/Cherry Valley area and am quite unhappy. I live in this area and use Cherry Valley Blvd. to reach the freeway to go to work and shopping. This type of warehouse will cause severe congestion on this two lane road as well as inadequate access to the freeway. I was fortunate to buy my home, by myself, this past year and can't even begin to imagine how this will affect my property values. Had I not purchased my home when I did, I would not have been able to. I am a very proud homeowner and am investing my hard earned money into my home in order to gain equity. A warehouse such as this will lower the value in my home. In addition, the pollution this will cause is unimaginable.

I strongly urge you to block and deny this warehouse project.

Thank you,

Tamra Johnson

Subject: Cherry Valley Project

Dear Mr. Rull,

My husband and I are unable to attend the meeting regarding the monstrosity proposed in our beautiful rural area. Riverside is not a hop skip and jump from our small town. We live here because we do not want to be in the smog and congestion of the areas closer to the cities.
1 traffic concerns
2 Accidents and crowding
3 air quality
4 will harm the environment
5 will force natural habitat animals like the kangaroo rat out of the area. We were forced to have a kangaroo rat study before we built our home.
Btw we abide by a 1 acre minimum when building houses.
6 we are a rural area without warehouses and factories
7 people still ride horseback and bike in the area
8 we don't have enough water
9 we are sick of being bullied and threatened by developers 10 traffic on the 10 freeway off and on ramps is already difficult enough! Look at the trucks that back up the 10 freeway in the Fontana area truck stops! And that is flat land! Imagine on an incline.

Have you been to our area, maybe we could have you come out and visit. We will point to areas where there is building that you should consider. Or reuse, repurpose and reinvent an abandoned area that needs a tax base to draw from!!!
Think green!!!

Sincerely, The Hanveys
39954 Cherry Valley Blvd.

Subject: Opposition to Gateway Project in Cherry Valley

Sent from Windows Mail
Mr. Rull

I would like the county to reconsider the building of the Gateway Project in Cherry Valley. We live in a rural, peaceful area that does not need to be transformed into a mini Fontana. The location that the county has proposed is not appropriate for our standard of living. We live and have purchased homes in Cherry Valley to get away from the city, please do not bring the city to us. Especially in the form of a monstrous distribution center. We are Cherry Valley, not Cherry Industry.

Mr. Rull, I am concerned about the pollution, I am concerned about the traffic, I am concerned about the air quality, and I am concerned that you will be marring our beautiful landscape that makes Cherry Valley what it is, with a an enormous warehouse that nobody wants or needs. Please take your business elsewhere. Your plan is disruptive and unwelcome to the citizens of Cherry Valley.

Thank you,

Trina Brown
Cherry Valley Resident/ Homeowner/ Environmental Activist
951-368-4356

Scoping Session:

Air Quality: The EIR must address "sensitive communities" that will be affected disproportionately by the increase in pollution that is a natural result of warehouse development. Research has shown that the elderly and other target groups are often exposed to unhealthful air more frequently and at higher levels that other groups. (Hall and Brajer report p.22-23) Identifying these communities is an essential part of describing the relevant CEQA setting.

The EIR must also analyze how the health of the residents of these "sensitive communities" would be expected to be particularly affected. Many EIR's fail to adequately analyze and disclose the details of the Project's air quality impacts and its true effects on public health. The EIR must provide enough information to determine how the health of the most vulnerable people in the region will be affected (e.g., residents of Cherry Valley already living directly adjacent to freeways traveled heavily by diesel-emitting vehicles), or how residents' risk of developing cancer will increase based on emissions from this warehouse.

The EIR must also fully disclose and analyze the impacts of the warehouse project on Greenhouse Gas emissions. California as a whole is facing severe impacts from global climate change caused by these emissions. The available science shows, and state law establishes, that the state must substantially reduce its Greenhouse Gas emissions. Any development must be required to show how the project will address these issues.

Any mitigation measures must be specific, enforceable, and feasible from the beginning of the project -- not at some future date. CEQA demands a full analysis and all feasible mitigation of every significant impact resulting from the implementation of any project. A development must not be approved unless and until it has adopted ALL feasible mitigation measures.

"Here is the email address for the County Planner: prull@rctlma.org. His name is Paul Rull. "

http://banning-beaumont.patch.com/groups/lloyd-whites-blog/p/25-million-sq-foot-warehouse-coming-to-cherry-valley

Dear Paul:

As a 30 year resident of Cherry Valley, I highly oppose these large warehouse projects and the truck traffic they will certainly draw. We should be reducing truck traffic, not increasing it. The air in the Pass is much worse on more days than ever before. Truly blue skies are ever more just a memory. I moved here from Riverside because of the clean air, the rural nature of a determined to stay that way community, and the local beauty.

On top of that, the entrance to this type community would be the worst possible place. These gargantuans, if they must be built, need to exist in already designated 'industrial zones.' Cherry Valley is about cherry trees, goats, horses, walking dogs to Bogart Park, and taking classes at The Grange. It is about small town atmosphere. It is about the entrance to Oak Glen. It is about natural beauty.

Building these large warehouses would destroy us, along with our spirit, and I beg you to fight against it, or at least help to locate them in a more appropriate place. Fontana? Near the rail yards? What about across from the monstrosity, already built at the northeast end of Moreno Valley, that has already severely limited one of the best views in the county.

Thank you for reading this.

Sincerely,
Victoria Wolf

To: Rull, Paul
Subject: The Gateway Project / Cherry Valley
Mr. Rull,

As a concerned resident of Cherry Valley, I respectfully, adamantly, oppose this project going forward. What about all the other gigantic empty warehouses in San Bernardino, Redlands, other parts of Beaumont, and Banning? The last thing citizens of the area need is another warehouse that is several times larger. The air/noise/and light pollution will be ridiculous. The community of Cherry Valley is a quiet, rural, town in the foothills. The sight of a warehouse the size of almost fifty football fields would be appalling against the mountain back drop of Oak Glen.

I don't logistically see how hundreds of semi trucks would even access the warehouse without severely crippling the flow of traffic in and around Cherry Valley Boulevard and the I10. Cherry Valley Boulevard is a two lane road, with stop signs at the freeway off ramps. Traffic is already horrible at the off ramps with just residents in the area. I could only imagine how backed up the off ramps, freeway, and surrounding areas would become with hundreds of semi trucks constantly in and out of the area.

I believe the traffic, air, noise, and light pollution from this project will be enormous and a burden to residents in the area. Cherry Valley is a rural community with several farms and pastures. Not to mention there is a nature preserve just on the opposite side of the freeway, downhill, and downwind from this planned warehouse. Housing prices will drop, and I for one will sell my house and move out of the area if this project goes forward. I know for a fact several neighbors will do the same. I don't want to see Cherry Valley become a burnt out corporate wasteland full of empty buildings and run down houses. I plead with you to put the residents, of Cherry Valley, Beaumont, Calimesa, Oak Glen, and Yucaipa, ahead of a company's agenda.

Thank you for your consideration. Any feedback you have would be appreciated.

-Zach Taylor

We would like to voice our objections to the above project. We moved from Redlands over 12 years ago, after 50 years of being born and raised there, to enjoy a rural setting. The crowds, the traffic, the development and removal of so many orange groves had made Redlands a different place and not one we wanted to live in. I don't wish to see the area we live in now changed by the impact this project would make.

I can list all the usual reasons such as air quality, a ridiculous amount of trucks and traffic on Cherry Valley Blvd, freeway entrances and exits that cannot handle these trucks and the Riverside County regulations which state one acre, one house in most parts of Cherry Valley as to why this project is being placed in an unsuitable location. We tried to parcel 5 acres between our son on Vineland Street in Cherry Valley and after 8 years, $18,000.00 and tons of hoops to jump through we gave up. How in the world can you explain to us how this could possibly meet the regulations when our simple request was met with every road block imaginable. We had to pay for an aerial photo and also pay for a county worker to come look at the property for burrowing owls and fairy shrimp?! Our property was approximately one mile from where this new project is looking to go. Explain to us how in the world this huge project is alright and splitting 5 acres into two parcels was not!

The manner in which this has been handled is questionable. If you actually live in this area you would know that this is the worst possible use of the land in that location. To alter that area with tons of dirt makes me wonder since friends of ours building in the area had numerous problems every step of the way with Riverside County just grading for their home. Makes you wonder?? We will be watching this project now that we have learned about it and will pass the word since for some reason it isn't common knowledge what is being attempted in our back yard!

Beaumont project

Sir
I know that a lot of people are opposed to this wearhouse project how ever I am pro on this project.
As for the debate about truck pollution people need to be advised that California trucks are the cleanest trucks in the nation with all of the thousands of dollars spent to get compliant with the new laws. As far as traffic it's right off the freeway and not every truck will pick up or deliver at the same time. Most of the wearhouses are open 24 hrs a day and since there are no homes next to this no one should be affected by noise.
I am a truck driver and can tell you first hand I have never seen any place that trucks make roads impassable due to trucks.

GATEWAY CENTER IN CHERRY VALLEY

NO,NO,NO,NO....DO NOT SEAL OUR TOWNS FATE OF BECOMING A GHOST TOWN .....

Dear Paul Rull,
I just moved into the area (Feb 1st) Rancho Calimesa Mobile Home Ranch for Seniors. I just left an area infested with delivery trucks. No way in "HELL" do I want this type of building going up in my new neighborhood. There is plenty of desert farther out that you can build your warehouse. Please leave our community alone. I have health issues with breathing already I do not need to breathe any diesel fuel or any fumes. We do not need any added congestion or freeway construction in the area.

Respectfully,

Deborah Terrell
I'm a concerned citizen!

Jan. 22, 2014

Dear Paul:

I just would like to tell you, I'm a Cherry Valley resident & I use Cherry Valley Blvd. for a lot of my business. It would be terrible for me to have all this landscape and traffic + noise for our area.

I moved here because of the rural and the natural beauty of Cherry Valley and the surrounding area.

Please stop this Gateway Center Project. I do not want this kind of business in our area.

Sincerely,
Dolores McCurry

RECEIVED
FEB 03 2014
ADMINISTRATION
RIVERSIDE COUNTY
PLANNING DEPARTMENT

Mr. Rull: This is to let you know of my strong opposition to the Gateway Warehouse proposed for building in Cherry Valley. Besides going against the zoning currently in place for that location, and the pristine surrounding area, this monstrosity would bring increased traffic, noise, pollution, decreased property values, and permanent damage to the rural community and its beauty. Industry does not belong in that location, and the only one to truly benefit is the Shopoff Group which will, of course, make monetary profit from it. This out-of-county group has no vested interest at all in our wonderful area, so it does not matter to them what damage they cause as they build and leave.

Please put me on the notification list for upcoming hearings on this project. Thank you.

Elaine Hernandez

Hello,
I live in Cherry Valley, Ca along with my family. I am writing you to let you know that the "Gateway Center" project is a BAD idea. Cherry Vally is a small town and we would love to keep it that way. We aren't set up for a BIG company to come in.... IF the "Gateway Center" goes through you will mess up our air quality and make it worse for my kids!!! And it will make a lot of truck traffic which the roads aren't set up for its ONLY a two lane road!!!! Our freeways on and off ramps will be so busy that we wont be able to use them we would have to find a different way to and from out house! This "Gateway Center" is not beneficial to a residential area with small roads again its a SMALL town and we don't need or want a big building/business in our town. But if it does go through it will lower mine and every one else's property values. I DO NOT WANT THIS "GATEWAY CENTER" to come into our town it is NOT welcomed!!!!

Hanna
909-557-3975

Dear Mr.Paul Rull,

I recently received information regarding a potential trucking business that wants to build a warehouse on Calimesa Blvd right next to the mobile home park that I live in. I came here because of the peace and seclusion and feel that this business will be the worst thing that could happen to this area.

It is my understanding that this warehouse will store over 400 diesel trucks, which will come and go onto our quiet Calimesa Blvd. It will affect our traffic, air quality, property value, noise level, and the overall charm that has been part of the Calimesa community. People that have come here to live out the rest of their retirement years, as I have, will be greatly affected by this decision.

I am hoping that money will not be your deciding factor as the whole community of Calimesa will reap the negative consequences from this business.

Thank you for your time,
Hope Amen

Comments regarding proposed Gateway Center submitted to Mr. Paul Rull

AIR QUALITY: The number of diesel trucks that would use this proposed facility would negatively affect air quality. A 300 plus site mobile home park is located in the near vicinity to the proposed project. This is senior (55 plus) mobile home park and has many elderly residents many of whom already have respiratory health problems, many on medically prescribed oxygen usage. Their health would be negatively affected by this project.

TRAFFIC: The proposed project would have 428 diesel truck bays, with perhaps 1000 trucks daily using the already overburdened Cherry Valley Blvd/I-10 interchange. Also, with an improving economy the Oak Valley housing development on the west side of the I-10 interchange will resume building houses which will create even more traffic. The truck traffic would also endanger school children who ride the many school buses that use Cherry Valley Blvd. for field trips to Oak Glen area apple orchards. There would also be in increase in street maintenance costs on Cherry Valley Blvd. due to the heavy weights of these trucks.

WATER QUALITY: Many residents in a wide vicinity near this proposed project rely on wells for their water supply, including the 300 plus households in the nearby Rancho Calimesa Mobilehome Park. Diesel fuel, a hazardous material, from the many trucks using this facility would undoubtedly pollute the area groundwater.

These concerns should and must be addressed in an Environmental Impact Report.

Submitted by James Overturf of Calimesa, Ca. phone 909-446-8367

John Russell<choc1up@yahoo.com>
Rull, Paul <PRULL@rctlma.org>
Gateway warehouse

Mr. Rull, my wife and I just wanted you to know how very much we are opposed to building this monster of a warehouse across the field from our 55 community. Not only will this devalue our homes but the pollution imposed on we Seniors will be awful as well. We will also lose access to the freeway and an added danger to our driving. We find NOTHING good about putting this project at this location. If it were being forced on your parents, I am sure you would do everything you could to defeat this project and I certainly HOPE you will consider us in your future decisions regarding this situation. Most Respectfully, John and Shirley Russell

Rull, Paul PRULL@rctlma.org

Objection to the proposed truck warehouse on Cherry Valley Blvd.

Per our telcon of this a.m.:
I am very opposed to the building of this facility at this location. This would be very close to a senior mobile home park on Calimesa Blvd. that houses older people who planned on living out our retirement years here. There are some here who have serious lung issues, requiring the use of oxygen. The lowering of the air quality by use of all the diesel trucks would be a disaster for them. Many are at a stage of life and disability that would make moving very difficult, if not impossible. Getting on the freeway from here can be quite difficult at the best of times, let alone what it will be like when 428 diesel trucks are heading out on a daily basis.
Property values are at historic lows, but changing a rural area to industrial purposes will likely render our homes valueless. Trucks do terrible damage to our rural roads, which were not the best to begin with.
I don't know why you would want to place such a facility in close proximity to a senior mobile home park.....but, if you choose to do so, you are showing your callus disregard for the elderly. If you do so, then shame on you.

Joni Haynes
10320 Calimesa Blvd. SPC 49
Calimesa, CA 92320

Dear Sir,
We moved to Cherry Valley 8 Yrs. ago from Long Beach to get away from Traffic and Big Trucks. We enjoy the fresh air and quite times here If we wanted to live near the trucks and traffic and smell of industry we would have moved to Fontana or Ontario. Please do not allow this project to proceed forward at this location. Put it over by the existing Warehouse areas. We have enough traffic and road wear and over used infrastructure. Thank You for your time and consideration in this matter. My Horses and poultry thank you also.

Joseph Kuhn
37735 Brookside Ave.
Cherry Valley CA 92223

Mr Rull I am ANGERED and APPALLED that YOU would try to pull this off without any consideration to what the people who actually live here might think. We all remember the water fiasco that happened.... and now you want to put his monstrosity in our neighborhood ??? Do you live here????Have you thought of what will happen here? More commercial logistic warehouses....if one is built more will come. If the zoning is changed for this project, other changes will be made. Who is going to want to live or build homes or min-ranches here? For travelers of Cherry Valley Blvd., this will say WELCOME... How sad! What about the natural waterway, the natural habitat for birds and animals of our area. What about our water??? What about contamination of our water? Contamination of our WATER, AIR, TRAFFIC. What about the change from a 2 lane to a 4 lane road and changes to the 1-10 on ramp and off ramp? We all know that change is going to happen.....But, please NOT this type of change. The million tons of dirt to cover this landscape only to be covered with millions of tons of concrete for a commercial logistics warehouse that will have 4XX bays for trucks that will have noisy and smelly trucks traveling in and out 24/7!!!!!!! I Implore you, PLEASE do not do this!!!! Julie Lewis

Please be informed that I am a Cherry Valley resident. I am strongly opposed to the I-10 Gateway project due to the traffic and undesirable impact it will have on the environment.

Katherine Talkington

Mr. Rull,
My name is Leigh Gileno and I am a new resident to the City of Beaumont. I was just informed of the proposed Monster Gateway Center Warehouse that is proposed to being built in the unincorporated area of Cherry Valley that is just a little over a mile from my home. I commute to Palm Springs 4 days a week for work and love the fact that I live in a nice suburban community that is geared toward families. The building of this monstrosity will ultimately hurt our community and I am diabolically opposed to its development. If this were a shopping center then maybe it would be met with a little more enthusiasm or optimism.

I am the former wife of 25 years of a trucking company. If anyone can attest to what this will mean for our community I can. The area proposed for this kind of building is absolutely preposterous. The pollution alone is a big factor…Air Pollution, Noise Pollution, Waste Pollution, Chemical Pollution and the list can continue to grow. Not to mention who ever ends up occupying the building and what they will manufacture will determine other pollutions as well. The damage that Commercial trucks bring to the streets alone will cost the City a lot of money to maintain. Not to mention the congestion of traffic to a nice, quiet rural community. I am not oppose to development but I am opposed to this particular development. We need retail, not warehousing. Give the community more reason to spend money locally not allow someone from the OC to come in and destroy our community. Retail will bring more jobs and sales tax for our Cities.

This project needs to be stopped. We do not want something that will destroy our community with pollutions, traffic and since of a home town family community. We do not want to be industrialized like Ontario or Rancho Cucamonga.

Please send me notifications of ALL upcoming hearings for this project.

Leigh Gileno
Concerned Citizen and Resident of Beaumont, CA.

Attn: Paul Rull:

As a resident of Solera Oak Valley Greens community in Riverside we oppose the Gateway Project as the freeway interchange at Hwy 10 and Cherry Valley Blvd is inadequate to handle the level of truck traffic that would result. The freeway exchanges limited capacity would severely impact the nearby residential community's access to the interstate, create congestion and be a safety issue.

sincerely. Leigh Stewart, 1156 Lantana Blvd., Beaumont, CA

Dear Sir: Please note that as nearby local residents in Cherry Valley, my husband and I

strongly oppose the Gateway Center Warehouse project. We would appreciate

you adding us to the notification list for upcoming hearings about the project.

Our address is: Les & Rhonda Breeden, 9243 Mountain View Avenue, Cherry Valley, CA 92223.

Thank you for your attention to this request.

Dear Sir:

As a home owner in Solera in Beaumont, I am deeply troubled by the prospect of the Gateway Industrial Center being proposed within a mile of where I live. This is a Senior Community and the pollution and noise this project would create would be immense. A project the size of 43 football fields has no place anywhere near the residential areas where many, many people live.

Please do all you can to stop this! Please notify me of any hearings where I may come to speak in opposition to this project. This is extremely disturbing to Beaumont, Calimesa, and Cherry Valley residents. NO, NO, NO!!! Please, please, please listen to us!!

Marsha Wolfersberger
1663 Woodlands Road
Beaumont, CA 92223
951-769-9969

Marsha Wolfersberger 

Greetings,

We moved to this area in 2005 and have grown to love it. We have managed to withstand the economic crash of the housing market and the standstill of progress here in the Pass. While we are all for growth this project would dramatically have a negative impact on quality of life. We oppose the Gateway Project and would value your support in our preservation of what is a dear to those of us in the area.

Quintanilla Household

Rhea Weber<rheaweb@gmail.com>

I am extremely concerned about this potential project moving forward. The size of this enormous warehouse will create many environmental concerns such as air quality, traffic on and off the I 10 at Cherry Valley which is currently congested, noise for two senior mobile home parks as well as two senior housing developments.

Please consider the concerns of many residents of this beautiful and rural area.

Mr. Rull,
Please help us stop the Gateway Center Warehouse. The interchange at the I-10 and Cherry Valley Boulevard can't handle the traffic it gets right now. It's a nightmare, that intersection. Who will pay for the damage to our roads? What about our air? We live here. We will show up in droves to stop this.

Please put us on the notification list for upcoming hearings on this project.

Thanks for your help.

Re: PROJECT CASE NO./TITLE: Project Title: I-10 Gateway Center Project
Case Numbers:
- General Plan Amendment No. 1079
- Change of Zone No. 7799
- Parcel Map No. 36564
- Plot Plan No. 25337
- Environmental Impact Report No. 534

Dear Paul:

In response to the NOP for above proposed Project, please be advised that the following considerations and/or elements need to be addressed and included in the Draft Environmental Impact Report (DEIR)

The project is ill-suited for the area, and therefore should not be constructed for the following reasons:

- The area around the site is predominantly rural agricultural/residential, with MPC's to the south. The use best suited for this area is rural residential/agriculture, not industrial warehouse
- Too close to large high quality residential MPC's, Within a distance of less than 2000 feet away to nearest housing tract, this project is far too close and will negatively impact the nearby large scale residential Master Planned Communities of Oak Valley Greens, Three Rings Ranch, Tournament Hills and Fairway Canyon, bringing pollution, blight and decreased property values to these communities that overall comprise over 5,000 homes and over 25,000 residents. A growing consensus from local economists and AQMD confirms that large industrial warehouses should not be constructed near residential communities.

- Land and neighborhood is poorly suited for warehouse. Consensus is growing and is becoming it is becoming widely accepted that large scale warehousing should be constructed around warehouse "hubs" that are found in large flat valleys near large capacity airports and raillines, and away from residential communities. In the IE, these hubs are found in Redlands Valley, Ontario, Moreno Valley and near former air force bases at Norton and March Field. Please note, most coveted Amazon logistics facilities are being constructed at these former airfields. Contrast this with "Gateway I10project" : the topography is rural open space sloping foothill near alluvial fans and natural streams. The nearest warehousing ,hub's are in Redlands (15 miles away) and Moreno Valley (20 miles away). This project would be an isolated eyesore, and does not have the necessary infrastructure most appropriately found in warehouse hubs.
- Water:
    - The developer has not explained why they are bypassing San Gorgonio Pass Water Agencies, which are best suited for considering project, and instead approaching Yucaipa Water agency, which services Yucaipa Valley. Also local water supplies will be negatively impacted as less water will be available to local residents and water pollution generated from warehouse tenants
    - Mitigation to address hydrology and water quality impacts is improperly deferred. Deferring preparation of a hydrology study is wholly improper. A hydrology study must be prepared for this Projectd
    - The EIR requires payment of fees to fund and construct supporting area-wide drainage improvements. CEQA requires that mitigation be certain and enforceable. It is unclear what program funds will be paid to, if any program exists at all. If such a program does exist, it is unclear when, if ever, drainage improvements will occur. Plot Plan Condition of Approval 7.10 states that "[a]ll lots shall be designed and graded to drain to the approved conveyance system" and requires the hydrology report (deferred) to demonstrate that flows for both 10-year and 100-year event will not inundate to any individual lot within the Project. This Condition needs to address impacts to off-site areas as well.
    - The Santa Ana Regional Water Quality Control Board needs to comment on the water quality impacts associated with this Project. In similar proposed projects the Regional Board has found that these projects may violate water quality standards and the board requires that a Water Quality management Plan must be prepared and circulated prior to project approval. The absence of a Water Quality Management Plan suggests that the County is in violation of, or threatens to violate, any permits.
    - The EIR should include an update on receiving or upgrading a wastewater treatment plant, and whether the receiving plant is operating over its capacity and violating water quality standards.
    - The EIR contains no discussion of storm water discharge, flooding, or drainage impacts

- Traffic:
    - The DEIR is failing to study impacts to local streets, local and regional highways including Cherry Valley Blvd., Tukwet Canyon Parkway, Palmer Boulevard, Oak Valley Parkway, San Timoteo Canyon Road; the street systems of the communities and cities of Cherry Valley, Calimesa, Beaumont, and Banning, and the local and regional highways of I-10, SR-60, State Route 111, I-215, and others.
    - The traffic analysis is not analyzing the negative impacts on nearby residential communities.
    - The TIA is failing to adequately address the negative impact of commercial truck trips (the primary vehicles servicing the warehouses) on surrounding road designs, road loads (exceeds existing tonnage capacities), road capacities. Etc.
    - The analysis of traffic impacts assumes that lane configurations and traffic controls will be in place. However, lane configurations and traffic controls are not required. The analysis also incorrectly assumes that the upgraded signaling and intersections will be in place. Reliance on unfounded assumptions makes the traffic analysis completely unreliable.
- Mitigation measures have not been identified.
- Alternatives: Alternative uses for the site have not been identified. Where there is an environmentally superior alternative that significantly decreases the significant impacts of the Project then that alternative must be approved rather than the Project if that alternative is feasible, even if the alternative would impede to some degree the attainment of the project objectives, or would be more costly. [(PRC§ 21002; *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 597, State CEQA Guidelines § 15126.6(b)] An environmentally superior alternative must be adopted in lieu of this Project.
- Statement of Overriding Considerations: CEQA Guidelines § 15093 (b) provides that when the agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR, but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The decision to approve a project in spite of significant environment impacts requires the decision-making agency to balance the economic, legal, social, technological, or other benefits of a proposed project against its unavoidable environmental risks. (Guidelines § 15093(a).) However, the Statement of Overriding Considerations ("SOC") shall be supported by *substantial evidence* in the record. (*Id.*) In *Sierra Club v. Contra Costa County* (1992) 10 Cal.App.4th 1212, 1222, the court said: "Whereas the [mitigation and feasibility] findings … typically focus on the feasibility of specific proposed alternatives and mitigation measures, the statement of overriding considerations focuses on the larger, more general reasons for approving the project, such as the need to create new jobs, provide housing, generate taxes, and the like." Substantial evidence in the record does not support the adoption of a Statement of Overriding Considerations. This Project is totally inconsistent with the benefits claimed in the Statement of Overriding Considerations. Those benefits no longer exist should this Project be approved. The benefits claimed to outweigh unavoidable significant impacts to air quality and biological resources include: providing a variety of complementary land uses; providing dwelling units to respond to housing demand; reducing environmental impacts due to

complementary and mixed land uses; providing recreational facilities; and providing a commercial facility for project residents, among others. None of these benefits exist in this case. A Statement of Overriding Considerations cannot be supported for this Project.

- Noise: No noise studies have been prepared for this Project. These studies are necessary to adequately inform the public of noise impacts and to properly mitigate impacts. Noise associated with distribution/warehouse use is entirely different than noise associated with residential use.
- Land Use Planning: This Project results in a significant land use impact. It substantially alters the balance of uses set forth in the General Plan and Specific Plans. Staff Report claims that this Project is better suited for the area than existing agricultural and residential or other uses must fully evaluate the cumulative impacts of this Project.
- Wildlife: The EIR has not identified the existing wildlife in the area, nor has it evaluated the negative impact and/or mitigation of the project on the wildlife in the area.
- Air Quality: the negative impact on air quality has not been evaluated, particularly Diesel Particulate Matter (PM) and Health Risks. Nor has compliance with local and regional air quality standards been addressed
- The GHG Analysis is absent. The air quality analysis of the I10 Gateway Warehouse Project Plan EIR is not analyzing GHG emissions and therefore adopted no threshold of significance for these impacts. GHG impacts must be assessed. The County must undertake a good faith, reasoned analysis of these impacts and adopt all feasible mitigation, particularly in light of CEQA's new requirements for analysis of GHG emissions as well as recent State legislation aimed at substantial reductions of greenhouse gases. All feasible mitigation measures must be adopted

Sincerely,

Ron Roy

Mr. Paul Rull
Riverside County Planner
4080 Lemon St.
Riverside, CA 92501

Dear Mr. Rull,

I would like to express my concern regarding the Gateway Center Warehouse. This project would distroy our way of life in Cherry Valley. This is an area where folks come to get out of the city and pick cherries, apples and peaches, and purchase farm fresh produce and pasture-raised eggs. They come to see the ponies, llamas, horses and other livestock. Some enjoy it so much, they move here to raise their children in a rural environment, or retire here out the the hustle and bustle and enjoy the fresh air.

If this project were approved, polution would worsen, traffic would be terrible, our nearby schools, parks, elderly communities and our children would be exposed to all the negative effects of having a steady stream of 18-wheeler diesel trucks on Cherry Valley Blvd. The countryside would be destroyed, devaluing our property.

The Cherry Valley exit and entrance were not built to handle the traffic. It would create a horrific mess for homeowners in this area, as well as all traffic passing through this stretch of the 10-Freeway. One example is the stretch between Cherry Valley Blvd and Calimesa Blvd. exit. This project would bog down traffic due to the uphill slope, slowing a constant flow of 18-wheeler trucks, negatively impacting all those who use this stretch of the freeway. It would be worse than the Fontana exits with all their truck traffic. Cherry Valley is not Fontana. It is an upscale rural community.

If this project went through, people would not longer have a reason to visit or move to this area. Those that built custom homes would take a big loss when they sold their homes. Tax revenues would go down. Long time residence would see their way of life destroyed suffer the ill effects. It would become another dirty, polluted area that people would want to avoid. Please use the upmost care and caution in evaluating this proposal.

Also, I am concerned about the way Riverside County is rushing this project, instead of allowing all neighboring towns and citiess to receive the information and respond appropriately. Notification of neighboring cities and towns have been non-existent. There was a sign on Cherry Valley Blvd for a very short period of time. I believe it was on the wrong side of the street. It contained very little information about the proposed project, and nothing about how to get more information. I can think of no good reason for the vagueness, or for rushing this project through before the surrounding communities could evaluate the impact to them. I would like to encourage you to thoroughly research and understand the effects of this proposed project, and then reject it. It is a bad idea!

Please notify me of all meetings regarding this project and any other project that could effect our way of life in Cherry Valley.

Sincerely,
Sandra Leoni

Attn: Paul Rull, Project Planner
Riverside County Planning Dept.

Many of us in Cherry Valley & the surrounding affected area have just received the very disturbing news of a huge Gateway project that would cause the country area to be industrialized & bringing in the hundreds of diesel trucks that would be needed to service such a huge building and all the polution that all those trucks would cause. Diesel trucks have been know to cause cancer & lung problems to people living close to the Freeways that have heavy diesel truck traffic. Its unbelievable that Gateway would consider such a huge project in a populated area. We have periodic winds but not often enough or strong enough to combat that much pollution. There are many new homes close by. The chicken farm that had been in that location had to move because of pollution. This area is like a bowl that would cause the pollution to no doubt reach Calimesa, Beaumont, & Banning. Im sure there are less populated areas that would be more appropriate. I hope Gatewould consider all the problems involved & find a ~~new~~ more appropriate location.

Thurlow Lithgow

CVAR_08504

Hi I am a Beaumont resident.

I am concerned a about the project on Beaumont Ave. I do not have much information, only that it will create more traffic than we already deal with. According to the information there will be a truck entrance on Cherry Valley Blvd. As it is we deal with the traffic of at least three schools on that area. Can you give me more information as to how it is planned to avoid such traffic situations? Also is this new construction going to have some kind of air contamination effect, or how will it be avoided as well?

Thanks for your time.

Silvia Mendez
silmend2@aol.com

Dear Mr. Rull,

I talked with you this afternoon on the phone regarding the Gateway Project. I also wanted to e-mail you with my concerns regarding this proposed project and the changing of the zoning from residential to industrial in Cherry Valley.

My concern is that this will be changing the overall zoning of Cherry Valley from residential to industrial. We are a small rural community that values our one acre home sites. The industrial warehouses proposed to be put in our area could and would be the beginning for many more warehouses. This is where we live and raise our families and we don't want to be in the middle of light industrial property. The change in zoning is not for our benefit and is very detrimental to our lifestyle.

The impact on Cherry Valley Boulevard with a 428 bay warehouse will change our traffic from a rural community into a trucking lane. Cherry Valley Boulevard is our major road to have freeway access to Interstate 10 and it is **critical** to the local residents who live in Cherry Valley.

Residents who live in Cherry Valley will have to also contend with the view of these mammoth warehouses. Once the landscape is blighted by them there will be no changing back to a residential lifestyle. There is a better place for these warehouses than in our community. I would appreciate your considering the above listed points I have laid out in my e-mail.

I am very **opposed** to the Gateway Project and want to see the following project voted down in Cherry Valley.

Sincerely,

Teri Walder

My husband and I strongly oppose the building of the monster Gateway Warehouse in Cherry Valley. We do not appreciate an Orange County developer coming into our area to profit off of a monstrosity which will totally negatively impact our community. The lack of industrial development and open spaces is what drew us and many others to this area as a retirement community. The country feel is the charm that adds to the property value and quality of life that we experience. This warehouse will ruin all of this! Air pollution, noise pollution, traffic congestion, higher taxes for road improvement and repair, and depreciating home values which will produce blight.

Cherry Valley is a rural area where many people have farm animals and horses. Would they be forced to move if the pollution gets too great and the area gets re-zoned?

Because of my health issues (autoimmune deficiency) I need clean air. This would force us to move. There are many other retirees in this area who have health issues as well.

Please appraise us of any upcoming hearings on this project.

Thank you.

Respectfully,

Tom and Linda Brown

Sent from my iPad

Dear Mr. Rull,
As a long time resident of Cherry Valley I would like to object, and ask for your opposition, to the proposed Gateway Center on Cherry Valley Boulevard. As a homeowner of the area the thought of driving past a giant warehouse instead of a peaceful rural area is very distressing. Most people who live in Cherry Valley live there because they like the rural atmosphere. Please don't allow our area to become like those in Fontana, Moreno Valley, North Redlands and many others.
Thank you so much for your consideration,
Wendy Walder

Hello,

As a follow up to my previous e-mail, I would like to add my concerns regarding the quality of the roadway currently in place off Cherry Valley Blvd. and the I10 Freeway The roadway is already in poor condition, cracking, and pot holed. There are all ready numerous signs warning of overweight (10,000lbs+) commercial vehicles prohibited on Cherry Valley Boulevard. Again, I do not believe Cherry Valley is the place for this kind of project. The roadway is already in disrepair. I am also concerned of the wildlife in the area (Bob Cats, Coyotes, Mountain Lions, Squirrels, etc...) would be negatively impacted and displaced by this project.

I would like to be notified on any future updates or hearings regarding this project.

Thanks
-Zach Taylor

Subject: The Gateway Project / Cherry Valley

Mr. Rull,

As a concerned resident of Cherry Valley, I respectfully, adamantly, oppose this project going forward. What about all the other gigantic empty warehouses in San Bernardino, Redlands, other parts of Beaumont, and Banning? The last thing citizens of the area need is another warehouse that is several times larger. The air/noise/and light pollution will be ridiculous. The community of Cherry Valley is a quiet, rural, town in the foothills. The sight of a warehouse the size of almost fifty football fields would be appalling against the mountain back drop of Oak Glen.

I don't logistically see how hundreds of semi trucks would even access the warehouse without severely crippling the flow of traffic in and around Cherry Valley Boulevard and the I10. Cherry Valley Boulevard is a two lane road, with stop signs at the freeway off ramps. Traffic is already horrible at the off ramps with just residents in the area. I could only imagine how backed up the off ramps, freeway, and surrounding areas would become with hundreds of semi trucks constantly in and out of the area.

I believe the traffic, air, noise, and light pollution from this project will be enormous and a burden to residents in the area. Cherry Valley is a rural community with several farms and pastures. Not to mention there is a nature preserve just on the opposite side of the freeway, downhill, and downwind from this planned warehouse. Housing prices will drop, and I for one will sell my house and move out of the area if this project goes forward. I know for a fact several neighbors will do the same. I don't want to see Cherry Valley become a burnt out corporate wasteland full of empty buildings and run down houses. I plead with you to put the residents, of Cherry Valley, Beaumont, Calimesa, Oak Glen, and Yucaipa, ahead of a company's agenda.

Thank you for your consideration. Any feedback you have would be appreciated.

Dear Mr Rull,
Until I find out more about the Gateway Center project, I am going to be against it.
I live in Northern Beaumont and use Cherry Valley Blvd. most of the time to access the 10 Freeway. I believe that the traffic would become unbearable with this project. Also, the air pollution from the numerous trucks that would be using the facility would have a very negative impact on the area.

Please keep me advised of all meetings and activities related to this project.

Thank you,

Mr. Rull; It's hard for me to believe that a planner would even consider the subject project in an area already bounded by hundreds of homes. The massive enormity of the project would be more suited in an area like Desert Center where there is no city and county traffic and pollution concern. Imagine 1000 trucks in your area rumbling day and night in residential and rural areas. Cherry Valley Boulevard is the only local access to the 10 freeway for those commuting to points west. With 24 hr. trucking moving in the area, access would be difficult or problematic. The developers of this project have no concern for the impact of the local citizens. Their only objective is cheap land and huge profits. I dare say, large trucks rumbling down their streets would bring a cry to their congressman. Our area has been a haven for low density and rural atmosphere. My wife and I moved here 22 years ago because of the rural lifestyle. I realize there is a need for housing in areas not previously developed, but industrial development that disrupts the entire area is just not reasonable and acceptable. I hope you will consider this In rejecting this unreasonable project. Ed Cooper Cherry Valley, CA

Subject: The Gateway Project

We would like to voice our objections to the above project. We moved from Redlands over 12 years ago, after 50 years of being born and raised there, to enjoy a rural setting. The crowds, the traffic, the development and removal of so many orange groves had made Redlands a different place and not one we wanted to live in. I don't wish to see the area we live in now changed by the impact this project would make.

I can list all the usual reasons such as air quality, a ridiculous amount of trucks and traffic on Cherry Valley Blvd, freeway entrances and exits that cannot handle these trucks and the Riverside County regulations which state one acre, one house in most parts of Cherry Valley as to why this project is being placed in an unsuitable location. We tried to parcel 5 acres between our son on Vineland Street in Cherry Valley and after 8 years, $18,000.00 and tons of hoops to jump through we gave up. How in the world can you explain to us how this could possibly meet the regulations when our simple request was met with every road block imaginable. We had to pay for an aerial photo and also pay for a county worker to come look at the property for burrowing owls and fairy shrimp?! Our property was approximately one mile from where this new project is looking to go. Explain to us how in the world this huge project is alright and splitting 5 acres into two parcels was not!

The manner in which this has been handled is questionable. If you actually live in this area you would know that this is the worst possible use of the land in that location. To alter that area with tons of dirt makes me wonder since friends of ours building in the area had numerous problems every step of the way with Riverside County just grading for their home. Makes you wonder?? We will be watching this project now that we have learned about it and will pass the word since for some reason it isn't common knowledge what is being attempted in our back yard!

Cherry Valley, Ca.

Jan. 27, 2014

Dear Mr. Rull and Planning Dept,

We wish to express our extreme objection to the proposed Gateway Project in Cherry Valley and also the zone change from 'Rural' to 'Industrial' in this area.

There are constant winds through the Pass area from both the east and the west. The pollution from this Project would be a serious health concern for residents of the entire Pass area as well as Calimesa and Yucaipa. There are numerous retirees who moved here for health reasons and the pollution from the numerous trucks and diesel particles would be very hazardous to their health. Adequate water and traffic congestion should also be addressed.

Please reconsider giving approval ~~for~~ for the Gateway Project and the harmful effects to the citizens and the environment in this area.

Respectfully,

Mr. & Mrs. Lenard Richardson

Re: Comments – I-10 Gateway Job Center (Warehouse/Distribution Complex)– Case #PP25337 - General Plan Amend. No. 1079, Change of Zone No. 7799, Parcel Map No. 36564, Plot Plan No. 25337

Dear Paul Rull:

The City of Beaumont has reviewed the site plan exhibit for the **I-10 Gateway Job Center – Case #PP25337**, and the City supports projects that generate economic activity, such as this proposal; however, the City is concerned that the proposed two-building distribution/warehouse complex would not be a compatible use for this area.

To the south of the proposal, currently there is the approved Sunny-Cal Specific Plan, which would be directly across the street from this proposal. The Sunny-Cal Specific Plan was approved for 560 Single-Family Homes, with a minimum of 20,000 Square Foot Lots, on the lots that are adjacent to Cherry Valley Blvd, across from this project. Conceivable incompatibilities could include issues relating to noise, traffic, air quality, road circulation, etc.

Additionally, the character of Cherry Valley is rural residential in nature and this proposal would be an isolated industrial park, with no similar projects adjacent too, or within the vicinity of this proposal. It seems that this use could be classified as "Spot Zoning", which is generally not a recommended land use practice.

Lastly, there was no discussion, within the transmittal, of what type of Environmental Analysis has been completed so far, if at all, in relation to the proposal. The City of Beaumont would like to review this document when available.

Thank you for the opportunity to comment on this proposed project. If you have any further questions regarding the above mention item, please feel free to contact us here at the Planning Department at (951) 769-8518.

Sincerely,

Chris Tracy, AICP

GENERAL NOTES - FLOOR PLAN

A. THE SOILS REPORT PREPARED BY CENTER & ASSOCIATES PROJ. NO. [illegible] DATED ON 1/7/2013 SHOULD BE A PART OF THESE CONTRACT DOCUMENTS.

B. IF SOILS ARE EXPANSIVE IN NATURE, USE STEEL REINFORCING FOR ALL SITE CONCRETE.

C. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE WALL, FACE OF CONCRETE CURB OR GRID LINE U.N.O.

D. SEE "C" PLANS FOR ALL CONCRETE CURBS, GUTTERS AND SWALES. DETAILS ON SHEET AD.1 ARE MINIMUM STANDARDS.

E. THE ENTIRE PROJECT SHALL BE PERMANENTLY MAINTAINED WITH AN AUTOMATIC IRRIGATION SYSTEM, PRIOR TO INSTALLATION & AT LEAST 60 DAYS BEFORE BLDG. COMPLETION.

F. SEE "C" DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR SHALL VERIFY ACTUAL UTILITY CONTRACTOR SHALL VERIFY ACTUAL UTILITY LOCATIONS.

G. PROVIDE POSITIVE DRAINAGE AWAY FROM BLDG. SEE "C" DRAWINGS.

H. CONTRACTOR TO REFER TO "C" DRAWINGS FOR ALL HORIZONTAL CONTROL DIMENSIONS. SITE PLANS ARE FOR GUIDANCE AND STARTING LAYOUT POINTS.

I. SEE "C" DRAWINGS FOR FINISH GRADE ELEVATIONS.

J. CONCRETE SIDEWALKS TO BE A MINIMUM OF 4" THICK W/ TOOLED JOINTS AT 6' O.C. EXPANSION/CONSTRUCTION JOINTS SHALL BE A MAXIMUM 12' EA. WAY W/ 1/20 MAX. SLOPE. EXPANSION JOINTS TO HAVE COMPRESSIVE EXPANSION FILLER MATERIAL OF 1/4". SEE "L" DRAWINGS FOR FINISH.

K. PAINT CURBS AND PROVIDE SIGNS TO UNIFORM OF FIRE LANES AS REQUIRED BY FIRE DEPARTMENT.

L. CONSTRUCTION DOCUMENTS PERTAINING TO THE LANDSCAPE AND IRRIGATION OF THE ENTIRE PROJECT SITE SHALL BE SUBMITTED TO THE BUILDING DEPARTMENT AND APPROVED BY PUBLIC FACILITIES DEVELOPMENT PRIOR TO ISSUANCE OF BUILDING PERMITS.

M. PRIOR TO FINAL CITY INSPECTION, THE LANDSCAPE ARCHITECT SHALL SUBMIT A CERTIFICATE OF COMPLETION TO PUBLIC FACILITIES DEVELOPMENT.

N. ALL LANDSCAPE AND IRRIGATION DESIGNS SHALL MEET CURRENT CITY STANDARDS AS LISTED IN GUIDELINES OR AS OBTAINED FROM PUBLIC FACILITIES DEVELOPMENT.

O. LANDSCAPED AREAS SHALL BE DELINEATED WITH A MINIMUM SIX INCHES (6") HIGH CURB

P. APPROVED CONCEPTUAL LANDSCAPE PLAN PRIOR TO GRADING PERMIT

Notice of Preparation of a CEQA Document for the
I-10 Gateway Center Project

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. The SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the draft CEQA document. Please send the SCAQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to the SCAQMD. Please forward a copy of the Draft EIR directly to SCAQMD at the address in our letterhead. **In addition, please send with the draft EIR all appendices or technical documents related to the air quality and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files. These include original emission calculation spreadsheets and modeling files (not Adobe PDF files). Without all files and supporting air quality documentation, the SCAQMD will be unable to complete its review of the air quality analysis in a timely manner. Any delays in providing all supporting air quality documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. More recent guidance developed since this Handbook was published is also available on SCAQMD's website here: www.aqmd.gov/ceqa/hdbk.html. SCAQMD staff also recommends that the lead agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis.

The SCAQMD has also developed both regional and localized significance thresholds. The SCAQMD staff requests that the lead agency quantify criteria pollutant emissions and compare the results to the recommended regional significance thresholds found here: http://www.aqmd.gov/ceqa/handbook/signthres.pdf. In addition to analyzing regional air quality impacts, the SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional

significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the lead agency perform a localized analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/ceqa/handbook/LST/LST.html.

In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/ceqa/handbook/mobile_toxic/mobile_toxic.html. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses (such as placing homes near freeways) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Perspective*, which can be found at the following internet address: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process.

Mitigation Measures

In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate these impacts. Pursuant to state CEQA Guidelines §15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying possible mitigation measures for the project, including:

- Chapter 11 of the SCAQMD *CEQA Air Quality Handbook*
- SCAQMD's CEQA web pages at: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf.
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions
- Other measures to reduce air quality impacts from land use projects can be found in the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. This document can be found at the following internet address: http://www.aqmd.gov/prdas/aqguide/aqguide.html.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available via the SCAQMD's webpage (http://www.aqmd.gov).

The SCAQMD staff is available to work with the Lead Agency to ensure that project emissions are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at imacmillan@aqmd.gov or call me at (909) 396-3244.

Sincerely,

Ian MacMillan

Riverside, CA, CA 92502-1409

Regarding: I-10 Gateway Center Project: GPA1079, CZ7799, PM36564, PP25337, EIR No. 534

Thank you for the opportunity to respond to the Notice of Preparation of a Draft EIR for the above-referenced project. The primary concerns for the City of Yucaipa relate to potential traffic impacts and other impacts that may affect our residents. Traffic impacts and other issues requiring analysis and clarification are listed below. Specifically, we request that the following issues be addressed:

1. Address the anticipated traffic impacts to I-10 and its three interchanges through Yucaipa (County Line Road, Oak Glen Road/Live Oak Canyon Road, and Yucaipa Blvd.) in the Transportation/Traffic Section. Also address the intersections of County Line Road/Calimesa Blvd, Oak Glen Road/Calimesa Blvd, and County Line Road/5th Street in the Transportation/Traffic Section.
2. The NOP states that an application for annexation to the Yucaipa Valley Water District (YVWD) will be filed with San Bernardino County LAFCO. However, the project site is in Riverside County. YVWD is a local government agency that straddles the county line of San Bernardino and Riverside Counties. The Land Use/Planning Section should discuss and clarify the rationale for a LAFCO other than Riverside County LAFCO acting on an annexation request.
3. The NOP states that the westerly 16.5 acres of the project site is located within the City of Calimesa. This area is shown on Exhibit 3 (Site Plan), and although no buildings are proposed, a water quality basin with extensive grading and drainage infrastructure are indicated. The Land Use/Planning Section should discuss the role of the City of Calimesa in the process of considering an approval of the portion of the project site within their City.
4. The number of anticipated permanent jobs that will be created as part of this project should be discussed in the Land Use/Planning and Population/Housing Sections, along with a projection of new jobs or jobs that have been relocated from the region or outside the region.

5. The Aesthetics Section should address any designated scenic highways (I-10 Freeway, Cherry Valley Blvd) and the visual impact of the proposed buildings in this rural/agricultural area.
6. The Riverside County General Plan designation of the project site is Very Low Density Residential (VLDR) and Rural Mountainous (RM). Existing zoning is W-2, Controlled Development, which in Riverside County has historically been a designation for rural/agricultural areas. The Land Use/Planning Section should discuss in detail the General Plan Amendment and Zone Change and the rationale to support the proposed changes to Light Industrial (LI) and Industrial Park (I-P). The Draft EIR should also discuss the precedent that project approval would create for Cherry Valley Blvd. and the I-10 Freeway as a future industrial corridor.

In addition to responses to the above comments, please provide me with future notice of availability of the Draft EIR.

Sincerely,

CITY OF YUCAIPA

Joseph M. Lambert
Director of Development Services

To: Rull, Paul
Cc: Adrian Mcloughlin

Hello Mr. Rull,
I am writing to you as a concerned citizen who lives in Beaumont, CA. I am concerned about the proposed Gateway warehouse development. I live nearby the proposed site. This development would adversely affect our lives.
My son goes to Brookside Elementary. He could expect to go from peace and quiet to the noise of big rigs jack braking past his school. He could expect to spend more recess time inside due to increased air pollution. This project in the long term could affect his healthy development.
I commute to work using the Cherry Valley entrance to the I-10. My commute would be ruined by the smoke belching big rigs. My safety could be compromised by these rushing juggernauts. This warehouse will change our community from a rural/suburban one to an industrial one. We moved to Beaumont because it is semi rural, if we wanted industrial we would have moved somewhere else. This proposed monstrosity would destroy our property values.
I would like to be notified of any upcoming hearings on this project.
Thanks
Adrian McLoughlin

Subject: Stop the Monster Gateway Center warehouse

Dear Paul Rull,

In response to the article in News-Mirror some reasons for not building the Monster warehouse.
1. Traffic noise from 1000 18-wheelers a week. My ears are ringing listening to the tires hum and gear shifting going up and down hills.
The 18 wheelers will cause congestion and create possible accidents on I-10.
2. The developer is miles away from the project and does not want to incorporate which could cause lots of problems in ownership.
Example: Like part of the land is in Calimesa, Cherry Valley and Beaumont.
3. The diesel tractor-trailers will adversely affect air quality. We don't want smog layers added to our valley.
4. Affects lives of school children riding on school buses when they go on field trips and attractions in the area. The children want to
arrive at their destination quickly. Think how it would be a bus full of 42 students waiting behind a string of 18-wheelers exiting at the
narrow Cherry Valley off ramp.
5. If the Monster eye sore warehouse is built, you better believe our property values will go down. Who wants to live by a warehouse.
6. Warehouse jobs are limited like a fork-lift driver. Not much room for advancement.

PLEASE let's drop this idea of a Monster warehouse and plan to bring into our neighborhood Industry that can provide job positions and growth within a company for our younger generation. Imagine what a beautiful Industrial park could be built on this 2.5 million square foot area. With the right Architect a facility could be designed to add Class to the neighborhood not run it down. Young families are moving into our area because of affordable housing. Let's think about employing them with jobs with wages to afford their new home here in Yucaipa, Calimesa and Beaumont areas. Presently home owners must drive a long distance, some as far as Long Beach or Los Angeles, for employment. If jobs were offered here it would reduce traffic on the freeway, save gas cost and eliminate adding smog to our valley.
Sincerely,
Charles and Angeline Twitty of Yucaipa

Liz Westmoreland

Subject: Gigantic Gateway center warehouse

THIS EMAIL HAS BEEN SUBMITTED VIA THE RCTLMA WEBSITE.

Just read about Riverside Co. fastracking this ungodly sight next to our 10 freeway cooridor. So far we have to warehouses anywhere near this sight & we'd like to keep it that way especially one that is 43 football fields long. Yucaipa has a policy of keeping of keeping the hills & cooridor open. Just because this area is unincorporated you think you can push the $ through & ruin the look of the area for all times as has been done in the Moreno Valley area. Please STOP this from going through. I'm going to do my level best to notify local areas to put a stop to this. Locate the damn thing in the warehouse zone in Redlands, Ontario & all the other zones (also off the 10 freeway but not observed while driving). So you won't make a few tax dollars but the local people will love you for it. Thanks

To: Rull, Paul
Subject: Gateway Center Warehouse

Dear Mr. Rull,

I have recently become aware of the proposed Gateway Center Warehouse project, that is slated to be built in Cherry Valley. Just the thought of this being built in my neighborhood is greatly concerning. My husband and I own a home in the Stetson community, which is right next to where this monstrosity could be built. The entrance to my tract is off Brookside and that two lane road would be the only divider between the warehouse and my family. I strongly oppose this project and ask that you please inform me when there are upcoming hearings on this project. The proposed site of the Gateway Warehouse is in between two single lane freeway exits that are already often backed up with vehicles from the residents of Cherry Valley and Beaumont, I cannot imagine the thought of adding the amount of eighteen wheeler traffic that this warehouse would bring. Not to mention the noise and pollution that would come with it. I feel that if the Gateway Warehouse project were to be approved it would have such a negative impact on my family's way of life, including our home property value. The home we live in is the first home we have ever purchased, we have three young sons and we love our neighborhood but would consider moving if this project moves forward, which is an upsetting thought. I am asking that you please take my concerns into account regarding this matter.

Thank you,

Cortney Overson

STOP GATEWAY WAREHOUSE PROJECT IN CHERRY VALLEY

TO: MARION ASHLEY, COUNTY PLANNER PAUL RULL, RIV COUNTY BOARD OF SUPERVISORS, RIV. COUNTY TRANSPORTATION AND LAND MANAGEMENT AGENCY (TLMA), RIV. COUNTY PLANNING DEPT., CA FISH AND GAME, AIR QUALITY MANAGEMENT DISTRICT (AQMD), CALTRANS

Stop this montrous project from being built in our pristine rural community. Do not Allow the Shopoff Group from Orange County to rezone and build a warehouse in our resisential community that will alter everything about our community and way of life. It will greatly effect all our surounding communities, Beaumont, Calimesa, Yucaipa, & Banning, lets unite and stop Gateway!

A 2.5 million square foot warehouse, the size of 43 football fields, is planned for the north side of Cherry Valley Blvd, just east of the I-10 interchange. It's called the Gateway Center Warehouse. It will have 424-484 bays for 18-wheel diesel tractor-trailers and the building will be 40% larger than the Sketcher Warehouse on Route 60 in Moreno Valley. Imagine that in the middle of our housing communities.

The Shopoff Group, a developer from Orange County, will build the warehouse and then will attempt to sell it. They claim it will bring jobs. What we can expect is our pristine rural land will be converted into a heavy industrial zone for their own profit. The building of the monster warehouse may create construction jobs temporarily, but there is no guarantee it will employ our local citizens. The Gateway Center Warehouse will bring traffic, noise, pollution, decreased property values, permanent damage of our pristine rural community, and will drastically alter our quality of life.

Act now to keep heavy industry out of Cherry Valley.

Re: I-10 Gateway Center Project

Dear Mr. Rull:

We are submitting these comments concerning the Notice of Preparation of a Draft Environmental Impacts Report for the I-10 Gateway Center Project on behalf of Cherry Valley Pass Acres and Neighbors ("CVAN") and the Cherry Valley Environmental Planning Group ("CVEPG"). Please provide us with all future notices regarding this Project.

CVAN is a California non-profit corporation comprised of more than 300 families, many of whom live and work in Cherry Valley, an unincorporated community of interest located east of the proposed project.

CVEPG is a California non-profit corporation that was established to protect and preserve the environment and water supply in and around Cherry Valley.

As a preliminary matter, we understand that the County of Riverside has set a deadline for submission of comments for 45 days after receipt of the notice of the NOP. While we are submitting our initial comments within that time period, you should recognize

that in accordance with applicable law we reserve our rights to submit additional comments, orally and in writing, up until the time the City takes final action on an EIR.

The NOP relates to a proposed project consisting of two 47 foot high industrial buildings totaling 2,560,000 square feet, with 428 bay doors, as well as a General Plan Amendment and Change of Zone to remove the project site from the Cherry Valley Gateway Policy Area and to change the applicable zoning from residential to industrial.

Cherry Valley Policy Area and Cherry Valley Gateway Policy Area

As is indicated by the proposed General Plan Amendment and Change of Zone, the proposed Project is inconstant with the plan for the Project site and the surrounding character of the area. Due to this inconsistency, the Project would have, among other things, significant aesthetic, cultural, and land use impacts. These impacts should be fully mitigated or avoided.

The Project site is stated to be located in the Cherry Valley Policy Area and Cherry Valley Gateway Policy Area. As stated in the County of Riverside General Plan, The Pass Area Plan, "Cherry Valley, located east of Interstate 10 and north of Beaumont, is a rural and equestrian community with small orchards, mobile homes, and single family residences." The intent of the Cherry Valley Policy Area "is to maintain the predominantly rural community nature of this area." The Pass Area Plan recognizes the "rural atmosphere of the area," the limited capacity of public services, and flooding hazards. The Cherry Valley Gateway Policy Area "shall be developed as a gateway to Cherry Valley" and "shall be developed to evoke the rule character of that area." The proposed industrial Project is

wholly inappropriate for the site as it would substantially degrade the rural character of the area. The EIR should thus consider alternative locations for the Project.

Agricultural Impacts

All loss of agricultural resources should be fully mitigated. The EIR should consider, among other things, the use of conservation easements to mitigate the Project's impacts.

Air Quality and Climate Change Impacts

The Project will likely rely extensively on the consumption of fossil fuels, including the heavy volume of truck traffic generated by the Project and the Project's consumption of energy. Reliance on fossil fuels will result in significant air quality and climate change impacts. It is well settled that pollutants associated with fossil fuel use will have significant adverse impacts on human health and our environment, and will impact both current and future generations. The area is currently designated as non-attainment under the Clean Air Act and there is a statewide effort to reduce emission of greenhouse gases below existing levels. Because air pollutants already exist in the atmosphere at unacceptably high levels, it is vitally important to both reduce current emissions and to minimize creation of new sources of pollution. This Project will exacerbate the current pollution problem.

The EIR should fully disclose the direct and indirect emissions the Project will cause and the methodology used. The EIR should further disclose all environmental impacts, including health impacts and other impacts associated with the release and deposition of diesel particulate matter. The evaluation of impacts should consider all affected areas,

including all areas where traffic will increase, not just a relatively small area immediately surrounding the Project site. All types of traffic, including passenger vehicles, trucks, trains, airplanes, and cargo ships should be considered.

The Project should fully mitigate its significant air quality and climate change impacts. In addition, the County and applicant should consult with expert agencies, such as the California Air Resources Board, the California Air Pollution Control Officer's Association, and the South Coast Air Quality Management District, to, among other things, identify feasible alternatives and mitigation measures. Mitigation should include: onsite renewable energy production; solar water heaters; use of electric vehicles; obtaining emission offsets so that there is no net increase in the local area's emissions; utilizing only native drought tolerant landscaping; avoiding or minimizing sources of volatile organic compounds found in certain paints, solvents and other substances; minimizing or prohibiting idling of trucks; facilitating use of public transportation and carpooling by workers; use of recycled water for all permitted uses; include electric charging stations and car pooling spaces in the parking lot; use dust abatement during construction; and use of passive solar design.

Biological Impacts

The EIR should identify all impacted species and the impacts to them. The analysis must include evidence from surveys and information from expert agencies, such as CalWild. The EIR should consider impacts to migration and local movements. It should also consider impacts on and offsite due to the noise, pollution, lighting, and conversion of

open space which could both directly kill a species and result in a disturbance which causes of species to change its behavior. The analysis should consider the effects of climate change, which would likely be exacerbated by the Project, including any foreseeable changes to habitat and ranges of species. Mitigation should include an increase in the open space on the Project site, obtaining conservation easements on other sites to preserve open space and habitat, funding conservation efforts by agencies or non-profits to protect or improve habitat, and all suggested measures by expert agencies.

Hazardous Materials

The Project will introduce new sources of hazardous materials to the region. The EIR should identify all hazardous materials that the Project may cause to be released including fuel, solvents, cleaners, diesel particulate matter, air pollutants including green house gases and toxins, lubricants, coolants, paints, and oils. The EIR should also consider all potential sources of releases such as storage tanks, trucks and other vehicles, pipes, and equipment used at the site. Impacts to consider include groundwater and soil impacts, health impacts, and air quality and climate change impacts.

Hydrology

The Project is located in area that provides natural drainage and is subject to flooding. The Project will alter the hydrology of the site by altering drainage channels and placing an impervious surface over a large area. The EIR should thus fully evaluate hydrology impacts and fully mitigate any significant impacts, both on and off site. The

analysis should consider the impact to groundwater recharge and impacts to the quality and quantity of water being discharged at the Site.

Noise

The Project site is currently rural and generates very little noise. The EIR must provide an analysis of all sources of noise from the Project (including engines, air conditioning units, horns, car alarms, and opening and closing of doors on truck bays and truck trailers). The analysis should consider actual impacts, not just whether a noise ordinance would be complied with. The analysis should consider all times when operations would be conducted and impacts both on and offsite. Offsite impacts would include noise from trucks, including increased noise caused by trucks travelling up grade.

Recreation

It is noted that informal trails exist on the Project site. The loss of these trails should be mitigated. Measures that should be considered include a conservation easement on other lands which allow for trail use.

Traffic

The EIR should consider both local traffic impacts and impacts throughout the region. The analysis should consider, among other things, the impacts to emergency response times, impacts to the levels of service of all impacted roadways, any infrastructure that will be needed on and offsite to accommodate the increased traffic, the physical wear and tear to roads and infrastructure caused by the Project's traffic, impacts to public transportation, including both increased demand for services, and impairment of service

times caused by increased traffic, and all vehicle miles travelled associated with the Project. The Project's significant impacts should be fully mitigated. Among other things, the EIR should consider measures that would offset the Project's traffic impacts by reducing other sources of traffic impacts.

Water Supply

The EIR needs to identify viable sources of water to supply the Project. The analysis must consider all current demand and foreseeable future demand in the region. There is not sufficient ground water in the region to supply current uses, thus the Project should not depend on the use of groundwater as it will only exacerbate overdraft conditions. The EIR should evaluate the use of recycled water. Because many agencies and project proponents indicate in the approval process that recycled water will be used, but ultimately fail to utilize recycled water once projects are approved, the County should make construction of the Project dependent on recycled water and necessary infrastructure being available. The EIR should also evaluate use of State Water Project water. And because SWP water and the infrastructure needed to supply have not always materialized as planned, construction of the Project should be made contingent on substantial evidence that SWP water will be available in sufficient quantities.

All feasible mitigation measures should be adopted so that the Project's water supply impacts are minimized. This includes a requirement of: native drought tolerant vegetation; dual flush ultra low flow toilets; use of recycled water for irrigation and all other approved purposes, and low flow fixtures.

Cumulative Impacts and Growth Inducing Impacts

As noted above, the EIR should consider the entire area potentially impacted by the Project, not just the immediate area surrounding the Project site. For the area that the EIR does analyze for its cumulative impact analysis, a detailed statement of why that area was selected should be provided. It may be that the area is adjusted based on the type of impact at issue. The EIR should also consider all past, present, and foreseeable future projects in its analysis. All relevant agencies should be contacted to request a list and description of projects to consider. If an agency does not respond, available resources, such as the internet, should be used to identify projects. The EIR should consider all impacts throughout the supply chain, from manufacturing to consumption. For instance, if the Project would cause an increase in pollution from production of goods or an increase in the consumption of products with toxic properties, impacts should be disclosed and analyzed.

Growth Inducing impacts should be thoroughly analyzed, including the increased construction of infrastructure, housing, retail, and manufacturing facilities the Project may induce.

Thank you for providing us with the opportunity to comment on the Project.

We look forward to participating in future meetings and reviewing the EIR.

Very truly yours,

Patsy Reeley
President Cherry Valley Pass Acres & Neighbors

Subject: 1-10 GATEWAY CENTER PROJECT BOUNDARY ADJUSTMENT

Mr Rull I am ANGERED and APPALLED that YOU would try to pull this off without any consideration to what the people who actually live here might think. We all remember the water fiasco that happened.... and now you want to put his monstrosity in our neighborhood ??? Do you live here????Have you thought of what will happen here? More commercial logistic warehouses....if one is built more will come. If the zoning is changed for this project, other changes will be made. Who is going to want to live or build homes or min-ranches here? For travelers of Cherry Valley Blvd., this will say WELCOME... How sad! What about the natural waterway, the natural habitat for birds and animals of our area. What about our water??? What about contamination of our water? Contamination of our WATER, AIR, TRAFFIC. What about the change from a 2 lane to a 4 lane road and changes to the 1-10 on ramp and off ramp? We all know that change is going to happen.....But, please NOT this type of change. The million tons of dirt to cover this landscape only to be covered with millions of tons of concrete for a commercial logistics warehouse that will have 4XX bays for trucks that will have noisy and smelly trucks traveling in and out 24/7!!!!!!! I Implore you, PLEASE do not do this!!!! Julie Lewis

Subject: Gateway Center Warehouse

Supervisor Ashley,

The purpose of this e-mail is to let you know that I vehemently oppose the construction of the Gateway Center warehouse in Cherry Valley. I am a lifelong resident of Riverside County and have lived in the cities of Riverside and Perris, as well as the unincorporated areas of Jurupa Valley and now Cherry Valley. In addition to calling Riverside County home, my wife (Brandi) and I are proud employees of the County.

In 2002, we decided to move our family out of the Orangecrest area of Riverside due to smog, congestion, and basic quality of life issues that affected the entire family. We looked in many areas and finally decided on Cherry Valley due to its country atmosphere, clean air, and lack of congestion. When my parents (cc'd) retired two years ago, I convinced them to move to Riverside County and now they currently reside in the city of Calimesa.

This proposed warehouse will greatly affect the air, congestion, and small town feel; a few of the things that brought us out here in the first place. It is a depressing thought to believe we could have a warehouse the size of the Sketchers building in Moreno Valley, as well as hundreds of semi trucks traversing this area on a regular basis. As you can see, my family has a vested interest in the area, as well as Riverside County, and we would all appreciate it if you could pass on this project in favor of something else.

Regards,
David & Brandi Teets
Cherry Valley, CA

Subject: Gateway Center Warehouse

Mr. Rull; It's hard for me to believe that a planner would even consider the subject project in an area already bounded by hundreds of homes. The massive enormity of the project would be more suited in an area like Desert Center where there is no city and county traffic and pollution concern. Imagine 1000 trucks in your area rumbling day and night in residential and rural areas. Cherry Valley Boulevard is the only local access to the 10 freeway for those commuting to points west. With 24 hr. trucking moving in the area, access would be difficult or problematic. The developers of this project have no concern for the impact of the local citizens. Their only objective is cheap land and huge profits. I dare say, large trucks rumbling down their streets would bring a cry to their congressman. Our area has been a haven for low density and rural atmosphere. My wife and I moved here 22 years ago because of the rural lifestyle. I realize there is a need for housing in areas not previously developed, but industrial development that disrupts the entire area is just not reasonable and acceptable. I hope you will consider this In rejecting this unreasonable project. Ed Cooper Cherry Valley, CA

Subject: Gateway Project in Cherry Valley

Hello,
It's always typical for residents to resist change, especially when that change adds traffic and more people to their neighborhoods. Most of them have been residents of Beaumont since 2003 or later, they are part of the expansion that was resisted previously. What they are not considering is the fact that this would bring jobs to their community and more revenue for their city for infrastructure, not to mention more neighbors who could wind up being close friends someday. I strongly support this project and will do my best to help convey the positive aspects of this development to folks I meet. Thanks,

Alan Gooch, *Sr. Sales Counselor*

Subject: Planned Gateway Project

I have been informed of the plans to turn our community into a Commercial Warehouse area! As a resident of Cherry Valley you do represent me in this matter. I am thoroughly opposed to this plan. Its bad enough that we are faced with handling an additional housing development here but to impact our infrastructure with the heavy traffic and congestion that would result from the approval of this plan is totally unacceptable.

Respectfully,

Subject: Gigantic gateway center warehouse

What are you thinking fast-tracking a gigantic warehouse in the unincorporated area of Cherry Valley. Just because the area is unincorporated doesn't mean we can destroy the look of pristine hills & valleys. We need to keep the cooridor free of those monstrosities (unlike Moreno Valley). We have such a beautiful corridor coming up through Yucaipa & out to the desert, free of monster warehouses. Please do not do this. Rethink what you're doing for the sake of environmental effects w/trucks clogging up the arteries to/from & the asthetic look of the area. Keep the hills free of this. Yucaipa has adopted this plan & you should continue through w/it. Contact Yucaipa for info on this--you will like the results. People driving through the corridor should be free of this unsightly warehouse, 43 football fields long. Please do not do this for the sake of progress. There are many locations for this kind of warehouse (warehousing areas already exist everywhere in the Inland Empire. The $ you recieve for this is not worth it for the sake all the people who love the look of coming up the hill & out to the desert. Take a drive & really look at this, it's beautiful. Gladnie Bender

Subject: Gateway Center warehouse project north-east of the Cherry Valley exit

Dear Mr. Rull:

As a resident of Cherry Valley for 57 years, I am hereby expressing my grave concerns regarding the new monster Gateway Center warehouse project proposed to be built on the north side of Cherry Valley Blvd, east of the Cherry Valley exit.

Our beautiful, rural community has been home to me ever since I was a child and the fond memories of growing up here can never be replaced. This exit off Highway 10 happens to be the only direct access into Cherry Valley and I dread that anyone would even consider replacing our picturesque rolling hills with this concrete monstrosity.

I am a voting constituent and I strongly oppose the Gateway Center warehouse to be built here! I would hope you will do everything in your power to preserve our lovely community and oppose this project.

Please put me on your notification list for upcoming hearings on this project. Thank you.

Sincerely,

Helen Messrah

Subject: Cherry Valley Gateway Center Project

Dear Mr. Rull,

I have recently been informed of a proposed warehouse project in Cherry Valley.
After review of the draft environmental impact report, this project must not be allowed to continue and I am contacting you to voice my opposition to the project.
The impact to the rural community and home values in the affected area would be devastating. Below is just some of issues to consider:

- Traffic impact on Cherry Valley Blvd. (This is a main arterial road which residents use to commute to and from)
- Construction impact (just the infrastructure changes to support the project alone would impact the area for likely several years.)
- Air pollution resulting from the construction and facility operations.
- Impact to the local communities (law enforcement, city services (water, trash, etc), transient population that will be attracted to these sites, all will be drains on services already strained.)

Please let me know how I can best keep informed of this project's status.

Thank you,

Re: I-10 Gateway
Center Project

Dear Sir:

I am writing to ask the above project be denied for the following reasons:

4,367 students within 2 miles of this project - 780 within 1 mile

2,000 plus 55+ Senior dwellings within 1 mile - not to mention 100's of family homes

Extreem danger to the Beaumont Basin due to a very high permeability area on that exact sight & surrounding area

I have already brought these concerns & others to the:

Beaumont Basin Watermaster
at their February 5th, 2014
meeting

Chairman Duane Burk
% BCVWD
560 Magnolia Ave
Beaumont, Ca 92223

I also spoke at the Beaumont Unified School District Board meeting on February 11, 2014 The School District needs to be notified for their comments

I found in talking to Groups and individuals no notifications were received from your office.

As Chairperson of the Cherry Valley Unincorporated Community I request to be notified of any actions on this project and a copy of the Draft E.I.R.

Very truly yours —

Subject: Proposed Gateway Center Warehouse in Cherry Valley, CA.

Mr. Rull,

My name is Mary Bigness, and my Husband Michael and I moved to Cherry Valley/Beaumont in April 2013. One of the main reasons we moved to this area was due to the beautiful rolling hills and wide open spaces, not to mention the quaintness of the small ranches and farms where we can see Cows, Chickens, Goats, and all other sorts of animals on a daily basis, something you don't see in the City. Having been a "City Girl" all my life, it was a welcome change and one that I fell in love with immediately! So, as you might guess when I read about the proposed development of the Gateway Center Warehouse on Cherry Valley Boulevard, my hear sank! At 56 years of age, this is the first home I have ever purchased and I am so happy to be living in such a beautiful and rural area with beautiful rolling hills and a wonderful small town look and feel. I can't believe anyone in the Riverside County Planner's Office or anyone on the Beaumont City Council could even think to allow a huge warehouse such as this to be built in our area.

I don' know if anyone on the Beaumont City Council or in the Riverside County Planner's Office are aware, but there are many seniors (and others) who drive on Cherry Valley Boulevard on a daily basis, sometimes several times a day, because this is their ONLY route where they don't have to drive on the freeway to get to neighboring communities such as Calimesa and Yucaipa, because they are too afraid to drive on the freeway. If a huge warehouse with hundreds of semi-trucks traveling that same route everyday were to be built, this would close off an only viable route for these seniors and others who currently utilize this route to get to those neighboring communities and would basically cut them off from those communities they need to get to.

Another thing for consideration, if this huge warehouse was to be built and the business failed, which a lot of businesses in California seem to be doing, then we would be left with a HUGE and EMPTY "EYE-SORE" that would sit there for probably several or more years before anyone could even afford to do something with it, when instead we could have kept the beautiful rolling hills and wide open spaces that so many people cherish and love, and what my Husband and I fell in love with just about a year ago.

Please, I ask that you and all those individuals who have the power and ability to make the decisions on this project consider not only what I have pointed out in the paragraphs above, but also for the long term affects, and how a bad decision can last a lifetime.

Thank you for your time and consideration on this matter!

Respectfully,

Mary H. Bigness

Subject: Update on traffic issues regarding the Gateway project

Hi Paul,

Just a note to make sure you are in the loop on some of this. There was an accident on Cherry Valley Boulevard on Feb. 3 where a school bus was hit from behind by an automobile. There was personal injury, the driver of the Jeep was transported to the hospital I believe. No one in the school bus was transported (although I am not the authority on this I do not have the accident report, only eye witness who spoke to the police).

The school bus was stopped unloading/loading at the time. This is real concern on these rural streets and I am concerned about upping the traffic even on Brookside and Oak Valley as both a high number of students and seniors are driving on these main town routes.

Singleton Road in Calimesa and Cherry Valley are also feeds to a large number of seniors who are in the surrounding footprint of this project. As you recall, there are many new homes of young families as well as the four senior communities that are all within 1/2 mile of less of this project.

Thanks again for listening:) I have heard there is a transportation study underway, if this is separate from the EIR can I be on the distribution list for this also?

Good morning Mr Prull,

I just want to go on record that I oppose the Gateway Center Warehouse Project in Cherry Valley. Please put me on the list for any hearings and eventually a copy of the EIR.

It will be an absolute eyesore to build a 57 acre warehouse off one of the last remaining scenic offramp views from. the I 10. Also I can't imagaine how the large trucks will be able to take the offramp obn the eastbound side of Cherry Valley Blvd and be able to make that sharp left turn.I already envision traffic jams at that tiny intersaction and little two lane country bridge.

RE: Interstate 10 Gateway Center Project
Notice of Preparation (NOP) for an Environmental Impact Report (EIR)

Dear Mr. Rull:

The Riverside County Waste Management Department (RCWMD) has reviewed the NOP prepared for the Interstate 10 Gateway Center Project. The Project would construct an industrial distribution facility.

The RCWMD requests that the following potential project impact areas be analyzed and evaluated in the EIR:

1. Given its scale of development, the proposed project may have a significant solid waste impact. The RCWMD is particularly concerned about the quantity of construction and demolition (C&D) waste that could be generated by the project and how the waste will be disposed of. Should a large quantity of the projects' C&D waste be brought to a County landfill for disposal, it could exceed the landfill's daily permitted capacity, thus a violation of State regulations and an impact to County landfill operation. The projects' EIR should analyze this potential solid waste impact. RCWMD recommends that the following conditions be incorporated in the EIR as mitigation measures to ensure compliance with AB 939:

   a) **Prior to issuance of a building permit for EACH BUILDING**, a Waste Recycling Plan (WRP) shall be submitted to the Riverside County Waste Management Department for approval. At a minimum, the WRP must identify the materials (i.e., concrete, asphalt, wood, etc.) that will be generated by construction and development, the projected amounts, the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials, the facilities and/or haulers that will be utilized, and the targeted recycling or reduction rate. During project construction, the project site shall have, at a minimum, two (2) bins: one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Additional bins are encouraged to be used for further source separation of C&D recyclable materials. Accurate record keeping (receipts) for recycling of C&D recyclable materials and solid waste disposal must be kept. Arrangements can be made through the franchise hauler.

   b) **Prior to issuance of occupancy permits,** evidence (i.e., receipts or other type of verification) to demonstrate project compliance with the approved WRP shall be presented by the project proponent to the Planning Division of the Riverside County Waste Management Department.

2. Build-out of the Project may have the potential to generate a substantial amount of waste that might adversely affect solid waste facilities. To assess waste impacts, the DEIR will need to include the projected maximum amount of waste generated at built-out of the Project, using appropriate waste generation factors for the proposed land uses. (Note: Consult the CalRecycle website to determine waste generation factors at: www.calrecycle.ca.gov/wastechar/wastegenrates)

   Furthermore, this project is subject to the State Model Ordinance, implemented 9/1/94 in accordance with AB 1327, Chapter 18, California Solid Waste Reuse and Recycling Access Act of 1991. The following are the Riverside County Waste Management Department's recommended conditions of approval for projects subject to AB 1327:

   a) **Prior to issuance of a building permit for EACH BUILDING,** the applicant shall submit three (3) copies of a Recyclables Collection and Loading Area plot plan to the Riverside County Waste Management Department for review and approval. The plot plan shall conform to ***Design Guidelines for Recyclables Collection and Loading Areas,*** provided by the Waste Management Department, and shall show the location of and access to the collection area for recyclable materials, along with its dimensions and construction detail, including elevation/façade, construction materials and signage. The plot plan shall clearly indicate how the trash and recycling enclosures shall be accessed by the hauler.

   b) **Prior to final building inspection,** the applicant shall construct the recyclables collection and loading area in compliance with the Recyclables Collection and Loading Area plot plan, as approved and stamped by the Riverside County Waste Management Department.

3. The project proponent is also encouraged to consider incorporating the following measures to help reduce the anticipated project's solid waste impacts and enhance the County's efforts to comply with the State's mandate of 50% solid waste diversion from landfilling.

   - The use of mulch and/or compost in the development and maintenance of landscaped areas within the project boundaries is recommended. Recycle green waste through either onsite composting of grass, i.e., leaving the grass clippings on the lawn, or sending separated green waste to a composting facility.

   - Consider xeriscaping and the use of drought tolerant low maintenance vegetation in all landscaped areas of the project.

   - Hazardous materials are not accepted at the Riverside County landfills. Any hazardous wastes, including paint, used during construction must be properly disposed of at a licensed facility in accordance with local, state and federal regulations.

4. The following information can also be useful in the analysis of solid waste impacts:

   a. The Lamb Canyon and Badlands landfills are the nearest landfills to the project site.

   Lamb Canyon Landfill

   The Lamb Canyon Landfill is located between the City of Beaumont and City of San Jacinto at 16411 Lamb Canyon Road (State Route 79), south of Interstate 10 and north of Highway 74. The landfill is owned and operated by Riverside County. The landfill property encompasses approximately 1,189 acres, of which 580.5 acres encompass the current landfill permit area. Of the 580.5-acre landfill permit area, approximately 144.6 acres are permitted for waste disposal. The landfill is currently permitted to receive 5,000 tons of refuse per day and had an estimated total disposal capacity of approximately 15.646 million tons.[1] As of January 1, 2013 (beginning of day), the landfill had a total remaining capacity of approximately 7.616 million tons[2]. The current landfill remaining disposal capacity is estimated to last, at a minimum, until approximately 2021.[3] During 2012, the Lamb Canyon Landfill accepted a daily average volume of 1,638 tons and a period total of approximately 504,388 tons. Landfill expansion potential exists at the Lamb Canyon Landfill site.

   Badlands Landfill:

   The Badlands Landfill is located northeast of the City of Moreno Valley at 31125 Ironwood Avenue and accessed from State Highway 60 at Theodore Avenue. The landfill is owned and operated by Riverside County. The existing landfill encompasses 1,168.3 acres, of which 150 acres are permitted for refuse disposal and another 96 acres are designated for existing and planned ancillary facilities and activities. The landfill is currently permitted to receive 4,000 tons per day and had an estimated total capacity of approximately 17.620 million tons4. As of January 1, 2013 (beginning of day), the landfill had a total remaining disposal capacity of approximately 7.930 million tons.5 The Badlands Landfill is projected to reach capacity, at the earliest time, in 2024.6 During 2012, the Badlands Landfill accepted a daily average volume of 1,757 tons and a period total of approximately 541,034 tons. Further landfill expansion potential exists at the Badlands Landfill site.

5. Since hazardous materials are not accepted at Riverside County landfills, the project proponent shall take any hazardous wastes, including paint used during construction, to facilities that are permitted to receive them, in accordance with local, state, and federal regulations. For further information, please contact the Household Hazardous Waste Collection Program at 1-800-304-2226.

[6] Badlands JTD, Addendum No. 5, dated June 2010.

6. AB 341 focuses on increased commercial waste recycling as a method to reduce greenhouse gas (GHG) emissions. The regulation requires businesses and organizations that generate four or more cubic yards of waste per week and multifamily units of 5 or more, to recycle. A business shall take at least one of the following actions in order to reuse, recycle, compost, or otherwise divert commercial solid waste from disposal:
   - Source separate recyclable and/or compostable material from solid waste and donate or self-haul the material to recycling facilities.
   - Subscribe to a recycling service with their waste hauler.
   - Provide recycling service to their tenants (if commercial or multi-family complex).
   - Demonstrate compliance with the requirements of California Code of Regulations Title 14.

   For more information, please visit:
   www.rivcowm.org/opencms/recycling/recycling_and_compost_business.html#mandatory

Thank you for the opportunity to review and comment on the Notice of Preparation. We would appreciate a copy of the EIR on CD for review and comment when available. I can be reached at (951) 486-3280 if you have any questions regarding the above comments.

Sincerely,

Subject: I-10 Gateway Center Industrial Buildings Cherry Valley CA

Mr. Rull:
Thank you very much for taking the time to speak with me this afternoon. Please forward my displeasure to any action taking by the Board of Supervisor for Riverside County as to the approval of the I-10 Gateway Center Industrial Complex in Cherry Valley. I work as a Commercial Real Estate broker, however this project makes no sense to approve a zoning change from residential to industrial for that area. My family home has a view of the affected area. My home will not only be affected by this project, but for the other projects that will then request zoning changes to industrial. That area should be developed for residential projects only. Thank you, Roger Thompson

RIVERSIDE COUNTY
ADMINISTRATION

I-10 Gateway Job Center

Dear Sirs,

I must express my concern over this project of warehouses you want to build in our small family community of Cherry Valley.

As of this time I do believe many families as well as our family have moved to this community for the rural flavor and home atmosphere that we all have here. To think that we will now be inundated with semi truck traffic in our rural community when we already have warehouse facilities by the number near the railroad and 1st St. as it is.

I for one oppose this project in our rural community as it will interfere with what is already just a small community of families that still want to raise their children with family values of having a good work ethic and concern for fellow neighbors and friends. The good values that our country was built upon and those that still long to fulfill that lifelong desire for their children as good citizens and love for God & country.

I believe that we should keep all Industrial facilities in the same area that already exists for this area and not co- mingle industrial warehouses with family residential areas.

Thank you for considering my concern and objection to this project.

Kindly,

Shirley Kramer

Notice of Preparation of a CEQA Document for the
I-10 Gateway Center Project

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. The SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the draft CEQA document. Please send the SCAQMD a copy of the Draft EIR upon its completion. Note that copies of the Draft EIR that are submitted to the State Clearinghouse are not forwarded to the SCAQMD. Please forward a copy of the Draft EIR directly to SCAQMD at the address in our letterhead. **In addition, please send with the draft EIR all appendices or technical documents related to the air quality and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files. These include original emission calculation spreadsheets and modeling files (not Adobe PDF files). Without all files and supporting air quality documentation, the SCAQMD will be unable to complete its review of the air quality analysis in a timely manner. Any delays in providing all supporting air quality documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. More recent guidance developed since this Handbook was published is also available on SCAQMD's website here: www.aqmd.gov/ceqa/hdbk.html. SCAQMD staff also recommends that the lead agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis.

The SCAQMD has also developed both regional and localized significance thresholds. The SCAQMD staff requests that the lead agency quantify criteria pollutant emissions and compare the results to the recommended regional significance thresholds found here: http://www.aqmd.gov/ceqa/handbook/signthres.pdf. In addition to analyzing regional air quality impacts, the SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional

significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the lead agency perform a localized analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/ceqa/handbook/LST/LST.html.

In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/ceqa/handbook/mobile_toxic/mobile_toxic.html. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses (such as placing homes near freeways) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Perspective*, which can be found at the following internet address: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process.

Mitigation Measures

In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate these impacts. Pursuant to state CEQA Guidelines §15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying possible mitigation measures for the project, including:

- Chapter 11 of the SCAQMD *CEQA Air Quality Handbook*
- SCAQMD's CEQA web pages at: www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf.
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions
- Other measures to reduce air quality impacts from land use projects can be found in the SCAQMD's Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. This document can be found at the following internet address: http://www.aqmd.gov/prdas/aqguide/aqguide.html.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available via the SCAQMD's webpage (http://www.aqmd.gov).

The SCAQMD staff is available to work with the Lead Agency to ensure that project emissions are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at imacmillan@aqmd.gov or call me at (909) 396-3244.

Sincerely,

Ian MacMillan

Subject: Gateway Center Warehouse

Dear Mr. Rull:

As a resident of Solera Oak Valley Greens, I oppose the construction of the Gateway Center.

The location for this warehouse is not ideally suited for such a project. The area is heavily populated with single-family homes, the Beaumont High School and Brookside Elementary School. The onslaught of heavy 18-wheelers traveling to this location on a daily basis would create exhaust pollution affecting the air quality and high noise levels. The heavy traffic would interfere with workday business traffic, homeowner traffic, and be a danger and affect the health of the children attending these two schools. There would be long, long lines of these 18-wheelers exiting on Cherry Valley Boulevard thus slowing down the traffic which would then impact the off-ramp at Oak Valley Parkway as well. The I-10 freeway is an older freeway. The added strain to the pavement will deteriorate more quickly and will need constant repairs. More tax payer money down the drain. The I-10 is a heavily used freeway with many, many semi-trucks traveling east and west with commercial trade going to and from Arizona as well as west to Southern California's beach communities. The traffic commute especially to the eastern communities of Palm Springs, Indio, etc. could be heavily impacted and could impact on the tourist and tax revenues those cities now enjoy.

A large center such as the Gateway project would also impact the home prices of the housing developments of Tournament Hills, Sun Lakes, Solera Oak Valley Greens, and the Senior housing community of Four Seasons. It is also my understanding that there are plans for another housing development to be built on the vacant land along Brookhurst Avenue. Beaumont has become one of the loveliest and fasted growing areas for newer homes. Such a center as Gateway would be an ugly addition to this area. It's size and the projected traffic flow is just too great for this area. Huge warehouse centers belong in commercial zones such as the one where the current Sketchers Warehouse is now located. I can understand future development of smaller commercial businesses in this area of retail and small business offices that would not blight the Cherry Valley and Beaumont areas. Or even a development of townhouse dwellings.

This project should not be approved because the environmental impact on this area would be a definite negative impact. This land should be saved for another project which would be an asset to residents and businesses now located here.

Sincerely,

Stella Lucero

To: Rull, Paul
Subject: Gateway Warehouse opposition

Mr Rull, I am a local Cherry Valley resident of 8 years this September and local business owner. I have moved my family from the community of Ontario, CA to live in a more rural, non-commercial area. I am very concerned about the prospect of a logistics warehouse being built on what I consider the most unique entry into a quiet community, Cherry Valley Boulevard. The prospect of building a large warehouse off of Cherry Valley Blvd appears to be a real threat to adjoining properties, where just across the way higher density housing was approved a few years ago but yet to be completed where the old egg ranch was dismantled. The offramp and adjoining property at the 10fwy/Tukwet/Cherry Valley Blvd offramp are Riverside County/CalTrans/City of Calimesa domains and one common undersized bridge.

Please put me on the notification list for upcoming hearings for this project.

Concerned,

Steven Leach

Re: Gateway Center Warehouse

February 19, 2014

Dear Paul Rull,

We have lived in Beaumont and Cherry Valley since 1975 and have seen an unprecedented growth which has greatly affected our quality of life. We chose this area because of the ruralness of it and vowed never to live in a big city again. We moved to Cherry Valley in 2004, buying an acre with an old house, living as close to country as we could. Since then the new Beaumont High School was built right around the corner from us which has affected the traffic to an extreme. There is only one main street, that being Beaumont Ave., that takes us down into the town. During any school hours or activities the travel is slow and grueling. The school sits on the corner of Bmt. Ave. and Cherry Valley Blvd. Cherry Valley Blvd. is the only street leading to the freeway which is the way we take all the time.

Now there are plans to build the Gateway Center Warehouse on Cherry Valley Blvd. near the freeway entrance and exits. These are already overwhelmed ramps because of the new build west of the freeway and we know that adding this project will make it worse, not to mention having to deal with all the big rigs. It may be a good business to have but it is being placed in the wrong area. We do not want our countryside to be turned into a cement jungle, filled with trucks and cars.

If you, Mr. Rull, would come out here, park on the side of the road and look around you, pay attention to the country side, to the traffic (especially during school drop off and pick up hours) and to the fact that this is the only road coming off the freeway leading into the Cherry Valley area without having to go miles out of our way to find another already overused freeway entrance and exit, you would see firsthand why we, as voting constituents, stand against the building of this or any other facility like it in this portion of the Pass area.

There are other areas around where large businesses are filling in the land. Keep the industrial within that space and please don't take away that which all of us who live in this beautiful place, have chosen to spend our years enjoying.

Please keep us informed as to further hearings regarding this issue.

Thank you for listening,
Sincerely;
Terry & Debra Elliott

SECTION 1: EXECUTIVE SUMMARY

1.1 - Purpose and Methods of Analysis

The following air quality, health risk, and greenhouse gas analyses were prepared to evaluate whether the estimated criteria air pollutant, toxic air contaminant (TAC), and greenhouse gas (GHG) emissions generated from the San Gorgonio Crossing (project) would cause significant impacts to air resources in the project area. This assessment was conducted within the context of the California Environmental Quality Act (CEQA, California Public Resources Code Sections 21000, et seq.). The methodology follows South Coast Air Quality Management District (SCAQMD) recommendations for quantification of emissions and evaluation of potential impacts to air resources.

1.2 - Project Summary

The San Gorgonio Crossing Project site totals approximately 229 gross acres, of which approximately 140 acres would be included within the developed portion of the project. The remaining 85 acres would remain as natural open space (approximately 32 percent of the project site). The project would consist of two non-refrigerated industrial buildings Building 1 would comprise approximately 737,480 square feet, and Building 2 approximately 1,123,280 square feet, for a total of approximately 1,860,760 square feet of floor area[1]. The 2 industrial buildings would also include 30,000 square feet of office space.

Exhibit 1 provides a regional viciniy map of the project location, while Exhibit 2 provides a local vicinity map of the project location. As shown in the exhibits, the project is located in the County of Riverside off Interstate 10 south of Calimesa and north of Beaumont. Exhibit 3 provides the project site plan.

The project has committed to installing solar capacity capable of providing 23 percent of the project's electrical requirements. In addition, the two buildings would be designed to be eligible for the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED) Silver Certification. The LEED rating system is intended to assess and promote sustainable design and operation, including reducing the energy use and water consumption, among other sustainable materials and indoor environmental quality parameters.

The project is estimated to generate 3,126 total daily vehicle trips, which would be comprised of 1,935 daily passenger car trips, and 1,191 daily truck trips. During the peak hour (afternoon peak), the project is estimated to generate 223 vehicle trips per hour, which would be comprised of 149 passenger cars and 74 trucks. The project would also require the use of support equipment such as electric forklifts and yard trucks. This support equipment would be electrically powered. Detailed project construction and operational parameters are provided in Section 5 of this report.

[1] This assessment report is based on a total building area of 1,860,760 square feet. The most current site plan calls for a reduced project size of 1,823,760 square feet. Therefore, the results contained in this report provide a conservative estimate of project impacts.

1.3 - Standard Conditions

During construction and operation, the project must comply with applicable rules and regulations. The following are rules and regulations the project may be required to comply with, either directly, or indirectly.

1.3.1 - South Coast Air Quality Management District Rules

SCAQMD Rule 402 prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property.

SCAQMD Rule 403 governs emissions of fugitive dust during construction and operation activities. Compliance with this rule is achieved through the application of standard Best Management Practices, such as the application of water or chemical stabilizers to disturbed soils, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 mph, sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph, and establishing a permanent ground cover on finished sites.

Rule 403 requires that fugitive dust be controlled with the best available control measures, so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. In addition, SCAQMD Rule 403 requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance offsite. Applicable dust suppression techniques from Rule 403 are summarized below. Implementation of these dust suppression techniques can reduce the fugitive dust generation (and thus the PM_{10} component). Compliance with these rules would reduce impacts on nearby sensitive receptors.

Rule 403 measures may include but are not limited to the following:

- Apply nontoxic chemical soil stabilizers according to manufacturers' specifications to all inactive construction areas (previously graded areas inactive for 10 days or more).
- Water active sites at least three times daily. (Locations where grading is to occur will be thoroughly watered prior to earthmoving.)
- Cover all trucks hauling dirt, sand, soil, or other loose materials, or maintain at least 0.6 meters (2 feet) of freeboard (vertical space between the top of the load and top of the trailer) in accordance with the requirements of California Vehicle Code section 23114.
- Reduce traffic speeds on all unpaved roads to 15 mph or less.
- Suspension of all grading activities when wind speeds (including instantaneous wind gusts) exceed 25 mph.

Site Plan

THIS PAGE INTENTIONALLY LEFT BLANK

- Bumper strips or similar best management practices shall be provided where vehicles enter and exit the construction site onto paved roads, or wash off trucks and any equipment leaving the site each trip.
- Replanting disturbed areas as soon as practical.
- During all construction activities, construction contractors shall sweep onsite and offsite streets if silt is carried to adjacent public thoroughfares, to reduce the amount of particulate matter on public streets. All sweepers shall be compliant with SCAQMD Rule 1186.1, Less Polluting Sweepers.

SCAQMD Rule 481 applies to all spray painting and spray coating operations and equipment. This rule would apply to the application of architectural coatings to the exterior and interior or of the building walls. The rule states that a person shall not use or operate any spray painting or spray coating equipment unless one of the following conditions is met:

(1) The spray coating equipment is operated inside a control enclosure, which is approved by the Executive Officer. Any control enclosure for which an application for permit for new construction, alteration, or change of ownership or location is submitted after the date of adoption of this rule, shall be exhausted only through filters at a design face velocity not less than 100 feet per minute, nor greater than 300 feet per minute, or through a water wash system designed to be equally effective for the purpose of air pollution control.

(2) Coatings are applied with high-volume low-pressure, electrostatic and/or airless spray equipment.

(3) An alternative method of coating application or control is used which, has effectiveness equal to or greater than the equipment specified in the rule.

SCAQMD Rule 1108 governs the sale, use, and manufacturing of asphalt and limits the volatile organic compound (VOC) content in asphalt used in the South Coast Air Basin. This rule would regulate the VOC content of asphalt used during construction. Therefore, all asphalt used during construction of the project must comply with SCAQMD Rule 1108.

SCAQMD Rule 1113 governs the sale, use, and manufacturing of architectural coating and limits the VOC content in paints and paint solvents. This rule regulates the VOC content of paints available during construction. Therefore, all paints and solvents used during construction and operation of the project must comply with SCAQMD Rule 1113.

SCAQMD Rule 1143 governs the manufacture, sale, and use of paint thinners and solvents used in thinning of coating materials, cleaning of coating application equipment and other solvent cleaning operations by limiting their VOC content. This rule regulates the VOC content of solvents used during construction. Solvents used during the construction phase must comply with this rule.

SCAQMD Rule 1186 limits the presence of fugitive dust on paved and unpaved roads and sets certification protocols and requirements for street sweepers that are under contract to provide

sweeping services to any federal, state, county, agency or special district such as water, air, sanitation, transit, or school district.

SCAQMD Rule 1303 governs the permitting of re-located or new major emission sources, requiring Best Available Control Measures and setting significance limits for PM_{10} among other pollutants.

SCAQMD Rule 1415, Reduction of Refrigerant Emissions from Stationary Air Conditioning Systems. The SCAQMD originally adopted Rule 1415 to reduce ozone-depleting refrigerant emissions from stationary, non-residential air conditioning (comfort cooling) and refrigeration systems with full charge capacity of greater than 50 pounds, and using Class I and Class II refrigerants. Recently, the SCAQMD amended Rule 1415 to include high-global warming potential refrigerants. Further, the rule now applies only to air conditioning systems with full charge capacity of greater than 50 pounds of refrigerant.

SCAQMD Rule 2202, On-Road Motor Vehicle Mitigation Options, is to provide employers with a menu of options to reduce mobile source emissions generated from employee commutes, to comply with federal and state Clean Air Act requirements, Health & Safety Code Section 40458, and Section 182(d)(1)(B) of the federal Clean Air Act. It applies to any employer who employs 250 or more employees on a full or part-time basis at a worksite for a consecutive six-month period calculated as a monthly average.

1.3.2 - State of California

Emission Reduction Funding

Carl Moyer Memorial Air Quality Standards Attainment Program. Since 1998, the Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program) has provided funding to encourage the voluntary purchase of cleaner engines, equipment, and emission reduction technologies. The Carl Moyer Program plays a complementary role to California's regulatory program by funding emission reductions that are surplus, i.e., early and/or in excess of what is required by regulation. The Carl Moyer Program accelerates the turnover of old highly polluting engines, speeds the commercialization of advanced emission controls, and reduces air pollution impacts on environmental justice communities. Emission reductions achieved through the Carl Moyer Program are an important component of the California State Implementation Plan (SIP).

Regulation for Construction-Related Equipment

Airborne Toxic Control Measure for Diesel Particulate Matter from Portable Engines Rated at 50 horsepower and Greater. The purpose of this measure is to reduce diesel particulate matter (DPM) emissions from portable diesel-fueled engines with a horsepower of 50 or greater. Each fleet is required to comply with weighted reduced particulate matter emission fleet averages by compliance dates listed in 17 California Code of Regulations Section 93116. Portable equipment includes but is not limited to, air compressors, generators, concrete pumps, tub grinders, wood chippers, water pumps, drill rigs, pile drivers, rock drills, abrasive blasters, aggregate screening and crushing plants, concrete batch plants, and welders.

ARB Regulation for In-Use Off-Road Diesel Vehicles (Off-Road Regulation), Title 13, Article 4.8, Chapter 9, Section 2449 in the California Code of Regulations. On July 26, 2007, the ARB adopted a regulation to reduce particulate matter and NO_X emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. All self-propelled off-road diesel vehicles over 25 horsepower (hp) used in California and most two-engine vehicles (except on-road two-engine sweepers) are subject to this regulation. This includes vehicles that are rented or leased (rental or leased fleets). Such vehicles are used in construction, mining, and industrial operations. The Off-Road regulation:

- Imposes limits on idling (no more than five consecutive minutes) and requires a written idling policy;
- Requires a disclosure when selling vehicles;
- Requires all vehicles to be reported to ARB (using the Diesel Off-Road Online Reporting System, DOORS) and labeled;
- Restricts adding older equipment into fleets; and
- Requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits).

Regulations for Heavy-Duty Vehicles/Trucks

ARB Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling adopts new section 2485 within Chapter 10, Article 1, Division 3, title 13 in the California Code of Regulations. The measure limits the idling of diesel vehicles (i.e., commercial trucks over 10,000 pounds) to reduce emissions of toxics and criteria pollutants. The driver of any vehicle subject to this section: (1) shall not idle the vehicle's primary diesel engine for greater than five minutes at any location; and (2) shall not idle a diesel-fueled auxiliary power system for more than five minutes to power a heater, air conditioner, or any ancillary equipment on the vehicle if it has a sleeper berth and the truck is located within 100 feet of a restricted area (homes and schools).

ARB Requirements to Reduce Idling Emissions from New and In-Use Trucks. Amendments were made to Title 13 in California Code of Regulations in Sections 1956.8, 2404, 2424, 2425, and 2485. The amendment states: "all new 2008 and subsequent model-year heavy-duty diesel engines shall be equipped with an engine shutdown system that automatically shuts down the engine after 300 seconds of continuous idling operation once the vehicle is stopped, the transmission is set to 'neutral' or 'park,' and the parking brake is engaged. If the parking brake is not engaged, then the engine shutdown system shall shut down the engine after 900 seconds of continuous idling operation once the vehicle is stopped and the transmission is set to 'neutral' or 'park.'" There are a few conditions where the engine shutdown system can be overridden to prevent engine damage. Any project trucks manufactured after 2008 would be consistent with this rule, which would ultimately reduce air emissions.

Statewide Truck and Bus Regulation (Regulation to Reduce Emissions of DPM, Oxides of Nitrogen and Other Criteria Pollutants, from In-Use Heavy-Duty Diesel-Fueled Vehicles, Title 13, California Code of Regulations, Section 2025). On December 12, 2008, the ARB approved this regulation to reduce

emissions from existing on-road diesel trucks and buses operating in California. This regulation applies to all on-road heavy-duty diesel-fueled vehicles with a gross vehicle weight rating greater than 14,000 pounds, agricultural yard trucks with off-road certified engines, and certain diesel fueled shuttle vehicles of any gross vehicle weight rating. Out-of-state trucks and buses that operate in California are also subject. Under the regulation, older, heavier trucks (i.e. those with pre-2000 year engines and a gross vehicle weight rating greater than 26,000 pounds), are required to have installed a particulate matter filter and must be replaced with a 2010 engine between 2015 and 2020, depending on the model year. By 2015, all heavier pre-1994 trucks must be upgraded to 2010 engines and newer trucks are thereafter required to be replaced over the next eight years. Older, more polluting trucks are required to be replaced first, while trucks that already have relatively clean 2007-2009 engines are not required to be replaced until 2023. Lighter trucks (14,001-26,000 pounds) must adhere to a similar schedule. Furthermore, nearly all trucks that are not required under the Truck and Bus Regulation to be replaced by 2015 are required to be upgraded with a particulate matter filter by that date.

During operation, the project is required to comply with Title 24 of the California Code of Regulations established by the Energy Commission regarding energy conservation standards. The project is also required to comply with the California Green Building Standards.

Title 24. California Code of Regulations Title 24 Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings, was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. All buildings for which an application for a building permit is submitted on or after January 1, 2014 must follow the 2013 standards. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases greenhouse gas emissions.

The California Green Building Standards Code (CALGreen) went into effect on January 1, 2011. It is Part 11 of the Title 24 California Code of Regulations. CALGreen is a comprehensive and uniform regulatory code for all residential, commercial and school buildings. CALGreen does not prevent a local jurisdiction from adopting a more stringent code as state law provides methods for local enhancements.

CALGreen (code section in parentheses) requires:

- **Short-term bicycle parking**. If the new project or an addition or alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5 percent of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1).
- **Long-term bicycle parking**. For buildings with over 10 tenant-occupants or alterations that add 10 or more tenant vehicular parking spaces, provide secure bicycle parking for 5 percent of tenant vehicular parking spaces being added, with a minimum of one space. Acceptable parking facilities shall be convenient from the street and shall meet the following: 1. Covered, lockable enclosures with permanently anchored racks for bicycles; 2. Lockable bicycle rooms with permanently anchored racks; or 3. Lockable, permanently anchored bicycle lockers (5.106.4.2).

- **Designated parking**. For new projects or additions or alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles [201 spaces and over require at least 8 percent] (5.106.5.2).
- **Recycling by Occupants**. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage and collection of non-hazardous materials for recycling (5.410.1, 5.713.10).
- **Construction waste**. Recycle and/or salvage for reuse a minimum 50 percent of the nonhazardous construction and demolition waste (5.408.1). 100 percent of trees, stumps, rocks and associated vegetation and soils resulting from land clearing shall be reused or recycled (5.408.3).
- **Wastewater reduction.** Each building shall reduce by 20 percent wastewater by one of the following methods:
  - The installation of water-conserving fixtures or
  - Use of non-potable water systems (5.303.4).
- **Water use savings**. 20-percent mandatory reduction in indoor water use with voluntary goal standards for 30, 35, and 40-percent reductions (5.303.2).
- **Water meters**. Separate water meters for buildings in excess of 50,000 sq. ft., or buildings projected to consume more than 1,000 gallons per day (5.303.1).
- **Irrigation design**. Automatic irrigation system controllers installed at the time of final inspection shall be weather or soil moisture-based controllers that adjust irrigation in response to changes in plant needs, weather-based controllers (5.304.3).
- **Finish material pollution control**. Low-pollutant emitting interior finish materials such as adhesives, paints, carpet, and flooring (5.504.4).
- **Commissioning (5.410.2)**. For new buildings 10,000 square feet and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or, owner representative's project requirements.

1.4 - Summary of Analysis Results

The following is a summary of the analysis results:

- The project would exceed the SCAQMD regional emission significance threshold for ROG during construction. Mitigation Measures AQ-1 through AQ-5 are required to reduce the impact to less than significant.
- The project would not exceed the SCAQMD localized significance thresholds for NO_2, carbon monoxide (CO), and particulate matter during construction.
- The project would exceed the SCAQMD regional significance thresholds for ROG and NO_X during operation. Mitigation Measures AQ-6 through AQ-8 are applied to reduce the impact; however,

after application of mitigation, emissions of ROG and NOx would remain significant and unavoidable

- The project would not exceed the SCAQMD local significance thresholds during operation.
- The project generated construction and operational emissions would not exceed the current SCAQMD health risk significance thresholds at surrounding sensitive receptors.
- The project-generated traffic would not result in a carbon monoxide hot spot at project-impacted intersections.
- The construction and operation of the project would not exceed the SCAQMD health risk significance thresholds with the application of the new California Office of Environmental Health Hazards Assessment guidance that emphasizes the sensitivity and susceptibility of young children to exposures to carcinogenic substances
- The project's greenhouse gas emissions would be less than significant because the project will implement mitigation and project features that will achieve at least 100 points from the Riverside County Greenhouse Gas Emissions Screening Tables or achieve equivalent emission reductions from other measures approved by the County of Riverside

Impact AQ-1: The project would conflict with or obstruct implementation of the applicable air quality plan after incorporation of Mitigation Measures AQ-1 through AQ-8. **Significant and unavoidable impact.**

Impact AQ-2: The project would not violate air quality standards or contribute substantially to an existing or projected air quality violation. **Less than significant impact.**

Impact AQ-3: The project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions, which exceed quantitative thresholds for ozone precursors) after incorporation of Mitigation Measure AQ-1 through AQ-8. **Significant and unavoidable impact.**

Impact AQ-4: The project would not expose sensitive receptors to substantial pollutant concentrations. **Less than significant impact.**

Impact AQ-5: The project would not create objectionable odors affecting a substantial number of people. **Less than significant impact.**

Impact GHG-1: The project would generate direct and indirect greenhouse gas emissions that would result in a less than significant impact on the environment after incorporation of Mitigation Measures AQ-6, AQ-7, AQ-8, and GHG-1. **Less than significant impact.**

Impact GHG-2: The project would not conflict with any applicable plan, policy or regulation of an agency adopted to reduce the emissions of greenhouse gases after incorporation of Mitigation Measures AQ-6, AQ-7, AQ-8, and GHG-1. **Less than significant impact.**

1.5 - Mitigation Measures Applied to the Project

Construction

MM AQ-1 During mass grading and building construction, all off-road diesel-powered construction equipment greater than 50 horsepower shall meet or exceed United States Environmental Protection Agency (EPA) Tier 3 off-road emissions standards.

MM AQ-2 All Heavy-Heavy Duty Haul Trucks (HHD) accessing the project site shall use year 2007 or newer engines during all construction activities.

MM AQ-3 The following measures shall be applied to all projects during construction of the project:

a) Use paints with a volatile organic compound (VOC) content 100 grams per Liter or lower for both interior and exterior surfaces, if painted.
b) Recycle leftover paint. Take any leftover paint to a household hazardous waste center; do not mix leftover water-based and oil-based paints.
c) Keep lids closed on all paint containers when not in use to prevent VOC emissions and excessive odors.
d) For water-based paints, clean up with water only. Whenever possible, do not rinse the cleanup water down the drain or pour it directly into the ground or the storm drain. Set aside the can of clean up water and take it to the hazardous waste center (www.cleanup.org).
e) Use compliant low VOC cleaning solvents to clean paint application equipment.
f) Keep all paint and solvent laden rags in sealed containers to prevent VOC emissions.

MM AQ-4 Prior to issuance of any grading permits, the developer shall provide a traffic control plan to the County of Riverside that describes in detail the location of equipment staging areas, stockpiling/storage areas, construction parking areas, safe detours around the project construction site, as well as provide temporary traffic control (e.g., flag person) during construction-related truck hauling activities. The traffic control plan is intended to minimize traffic congestion and delays that increase idling and acceleration emissions. The applicant shall maintain one copy onsite in the construction trailer to the satisfaction of the County of Riverside

MM AQ-5 During project construction, the following measures shall be implemented to the satisfaction of the County of Riverside. Construction equipment maintenance records and data sheets of equipment design specifications (including the emission control tier of the equipment) shall be kept onsite during construction and subject to inspection by the County of Riverside.

a) Construction equipment shall be properly maintained according to manufacturer specifications.
b) All contractors shall turn off all construction equipment and delivery vehicles when not in use, or limit onsite idling for no more than 5 minutes in any one hour.

c) Onsite electrical hook ups to a power grid shall be provided for electric construction tools including saws, drills, and compressors, where feasible, to reduce the need for diesel powered electric generators.
d) The project shall demonstrate compliance with South Coast Air Quality Management District (SCAQMD) Rule 403 concerning fugitive dust and provide appropriate documentation to the County of Riverside.
e) Traffic speeds on all unpaved roads to be reduced to 15 mph or less.
f) Sweep streets at the end of the day if visible soil is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water).
g) Use street sweepers that comply with SCAQMD Rules 1186 and 1186.1.

Operation

MM AQ-6 Prior to operation of each warehouse building, the applicant shall demonstrate to the County of Riverside that vehicles can access the building using paved roads and parking lots.

MM AQ-7 The project shall implement the following measures to reduce emissions from onsite heavy duty trucks within six months after operations commence:

a) Post signs informing truck drivers about the health effects of diesel particulates, the California Air Resources Board diesel idling regulations, and the importance of being a good neighbor by not parking in residential areas.
b) Post signs in all dock and delivery areas containing the following: truck drivers shall turn off engines when not in use; trucks shall not idle for more than five minutes; telephone numbers of the building facilities manager and the California Air Resources Board to report violations.
c) Tenants shall maintain records on its fleet equipment and vehicle engine maintenance to ensure that equipment and vehicles serving the warehouses within the project are in good condition, and in proper tune pursuant to manufacturer's specifications. Tenants shall maintain records on its fleet equipment and ensure that all Heavy-Heavy Duty Trucks (HHD) accessing the project site use year 2010 or newer engines. The records shall be maintained onsite and be made available for inspection by the County.
d) The facility operator will ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board approved courses (such as the free, one-day Course #512).
e) Require facility operator to become a SmartWay Partner.
f) Require facility operator to incorporate incentives and requirements such that the maximum feasible number of truck trips will be carried by SmartWay 1.0 or greater carriers.
g) Prior to issuance of occupancy permits, signs shall be installed at each exit driveway, providing directional information to the County's truck route. Text on the sign shall read "To Truck Route" with a directional arrow. Truck routes shall be clearly marked pursuant to the Municipal code.

CVAR_08643

MM AQ-8 The following measures shall be incorporated into each building to reduce motor vehicle emissions:

a) All tenants shall participate in Riverside County's Rideshare Program. The purpose of the program would be to discourage single-occupancy vehicle trips and encourage alternate modes of transportation such as carpooling, transit, walking, and biking. The program shall provide employees with assistance in using alternate modes of travel, including carpooling encouragement, ride-matching assistance, and vanpool assistance.
b) A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building.
c) Each building shall provide secure bicycle storage space equivalent to two percent of the automobile parking spaces provided.
d) Each building shall provide a minimum of two shower and changing facilities within 200 yards of a building entrance.
e) Each building shall provide preferred parking for low-emitting and fuel-efficient vehicles equivalent to five percent of the required number of parking spaces.

MM GHG-1 Prior to issuance of building permits, the applicant shall provide documentation to the County of Riverside Building Department demonstrating that the project will implement the above described project features that will achieve at least 100 points from the Riverside County Greenhouse Gas Emissions Screening Tables or achieve equivalent emission reductions from other measures approved by the County of Riverside.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 2: LOCAL AND REGIONAL ENVIRONMENTAL SETTING

2.1 - Existing Physical Setting

2.1.1 - Local Climate

The project is located in the County of Riverside and within the South Coast Air Basin (SoCAB). The San Gabriel, San Bernardino, and San Jacinto Mountains bound the SoCAB on the north and east and by the Pacific Ocean to the west. The southern limit of the SoCAB is the San Diego County line. The SoCAB consists of Orange County, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County.

The distinctive climate of the SoCAB is determined primarily by its terrain and geographical location. Regional meteorology is dominated by a persistent synoptic high-pressure area that commonly resides over the eastern Pacific Ocean. Seasonal variations in the strength and position of this pressure system cause changes in the regional weather patterns. Warm summers, mild winters, infrequent rainfall, moderate daytime onshore breezes, and moderate humidity characterize local climatic conditions. This normally mild climatic condition is occasionally interrupted by periods of hot easterly winds associated with Santa Ana winds, winter storms, and infrequent summer thunderstorms.

The annual average temperature varies little throughout much of the SoCAB, ranging from the low to middle 60s, measured in degrees Fahrenheit. With more pronounced oceanic influence, coastal areas show less variability in annual minimum and maximum temperatures than inland areas where the project site is located. The climatological station closest to the project site is a National Weather Service Cooperative weather station located in Beaumont, about 3.5 miles east-northeast of the project site. Climatological data from the National Weather Service at this station spanning the period 1971-2000 indicates an annual average temperature of 63.6 Fahrenheit, with December the coldest month (mean minimum daily temperatures of 40° Fahrenheit) and July and August, the warmest months of the year (mean daily maximum temperatures of 96° Fahrenheit).

The majority of the annual rainfall in the SoCAB occurs between November and April. Summer rainfall is minimal and generally limited to scattered thunderstorms in the coastal regions and slightly heavier showers in the eastern portion of the SoCAB along the coastal side of the mountains. The climatological data from the Beaumont National Weather Service Cooperative station spanning the period 1971-2000 indicates an annual average precipitation of 19.28 inches. Eighty-five (85) percent of the annual rainfall occurs during the November to March rain season. Highest monthly average rainfall occurs during January. Year to year patterns in rainfall are unpredictable due to fluctuations in the weather. The dominant daily wind pattern across southern California is an onshore daytime breeze and an offshore nighttime breeze. The predominant wind direction in the project area is from the west-northwest during much of the year, with the exception of some of the days during the October to December period when the area experiences strong Santa Ana winds from the north and northeast directions. The Santa Ana winds are dry, sometimes hot and dusty winds in southern

California that blow westward through the canyons toward the coastal areas. The wind usually has its origin when cold air spills southward into the Great Basin, trapped between the Rockies to the east and the Sierras and Southern California coastal range to the west. This cold air mass is characterized by unusually high pressure near the land surface. Winds are driven into southern California when the pressure of this interior air mass exceeds the pressure along the California coast. Winds are often strongest in mountain passes that act as air ducts for the continental airflow. Because the air over the higher elevations of the Great Basin sinks as it flows into coastal California, it is heated adiabatically, and temperatures are often quite warm. This continental air mass is invariably dry, so the humidity in Santa Ana winds is low, often less than 25 percent relative humidity.

Exhibit 4 provides a wind rose[2] for the SCAQMD Banning air monitoring station located about eight miles southeast of the project site. As can be seen from Exhibit 4, the local dominant wind blows predominantly from the southwest quadrant. The annual average annual wind speed is about seven mph. These data are considered representative of meteorological conditions at the project site.

The SoCAB is located in an area of high air pollution potential, particularly from June through September due to the juxtaposition of the SoCAB's topography and synoptic weather influences. Even though the SoCAB has a semiarid climate, air near the surface is generally moist because of the presence of a shallow marine air layer. With very low average wind speeds and the inland mountains that act as a barrier, there is a limited capacity to disperse air pollutants horizontally. During spring and summer, air pollution created in the coastal areas and around the central Los Angeles area is transported inland until it reaches the mountains where the combination of mountains and inversion layers generally prevent further dispersion. This poor ventilation results in a gradual degradation of air quality from the coastal areas to inland areas. Air pollutants can be transported 60 miles or more inland by ocean air during the afternoons.

From early fall to winter, the transport is less pronounced because of slower average wind speed and the appearance of land breeze winds earlier in the day. During stagnant wind conditions, offshore land-breeze winds may begin by late afternoon. Pollutants remaining in the SoCAB are trapped and begin to accumulate during the night and the following morning. A low wind speed in pollutant source areas is an important indicator of air stagnation and the buildup potential for primary air pollutants. As indicated earlier, the region also experiences Santa Ana winds. If the Santa Ana winds are strong, they can surpass the sea breeze, and carry the suspended dust and pollutants out to the ocean. If they are weak, they cause stagnation, resulting in high pollution events.

Temperature inversions are another important feature that limits the vertical depth through which pollution can be mixed. During the summer, coastal areas are characterized by a sharp discontinuity between the cool marine air at the surface and the warm, sinking air aloft within the high-pressure cell over the ocean to the west. This marine/subsidence inversion allows for good local mixing, but acts like a giant lid over the SoCAB. The air remains stagnant, as the average wind speed in downtown Los Angeles becomes less than five mph. A second type of inversion forms on clear

[2] A wind rose is used to depict the frequency of wind directions and wind speed at a location. Air quality is often correlated with the dominant transport directions of the wind as depicted in the wind rose.

CVAR_08647

winter nights when cold air off the mountains to the south sinks to the valley floor while the air aloft over the valley remains warm. This forms radiation inversions. These inversions, in conjunction with calm winds, trap pollutants such as those from automobile exhaust near their source. They lead to air pollution "hot spots" in heavily developed coastal areas of the SoCAB, but onshore breezes often push the pollutants along canyons into the inland valleys. Summers are often periods of hazy visibility and occasionally unhealthful air, while winter air quality impacts tend to be highly localized and can consist of elevated levels of nitrogen dioxide and fine particulate matter.

2.1.2 - Local Sources of Air Pollutants

The project site is currently vacant except for the private use of some unpaved roads. The only emissions expected from the current site are the occasional fugitive dust from exposed soil areas. Within a radius of about 3 miles from the project, there are numerous residential areas. Emissions from the surrounding residences include the following: space and water heating, landscape maintenance, consumer products, and motor vehicles. Two main freeways, Interstate-10 and State Route 60, with their associated traffic and emissions are within this 3-mile radius.

2.1.3 - Local Air Quality

Existing levels of ambient air quality, historical trends, and future projections of air quality in the project area are best documented from measurements made near the project site. The SCAQMD maintains an extensive air-monitoring network that measures levels of several air pollutants throughout the SoCAB. The SCAQMD has subdivided the SoCAB into 36 Source-Receptor Areas (SRA), many containing one or more monitoring stations. These SRAs are designated to provide a general representation of the local meteorology, terrain, and air quality conditions within the particular geographical area. The project is located within SRA 29 (Banning Airport). During the latest 3-year period (2011 to 2013), various air pollutants were measured within SRA 29 at the SCAQMD's Banning Airport air monitoring station. The pollutant levels from SRA 29 were used to comprise a "background" for the project location.

Table 1 summarizes the air monitoring data for SRA 29 covering the period 2012 to 2014, the most current published 3-year monitoring period. Where data for a pollutant was not measured at the Banning Airport air monitoring station, the data from the nearest air monitoring station within the SoCAB measuring that pollutant was used.

Table 1: Air Quality Monitoring Summary

Air Pollutant	Averaging Time	Item	2012	2013	2014
Ozone[a]	1 Hour	Max 1 Hour (ppm)	0.117	0.115	0.114
		Days > State Standard (0.09 ppm)	40	24	22
	8 Hour	Max 8 Hour (ppm)	0.098	0.103	0.097
		Days > State Standard (0.07 ppm)	71	66	58
		Days > National Standard (0.075 ppm)	53	41	38

Attainment Status

The EPA and the ARB designate air basins where ambient air quality standards are exceeded as "nonattainment" areas. If standards are met, the area is designated as an "attainment" area. If there is inadequate or inconclusive data to make a definitive attainment designation, they are considered "unclassified." National nonattainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards. Each standard has a different definition, or 'form' of what constitutes attainment, based on specific air quality statistics. For example, the Federal 8-hour CO standard is not to be exceeded more than once per year; therefore, an area is in attainment of the CO standard if no more than one 8-hour ambient air monitoring values exceeds the threshold per year. In contrast, the Federal annual $PM_{2.5}$ standard is met if the three-year average of the annual average $PM_{2.5}$ concentration is less than or equal to the standard.

The current attainment designations for the basin are shown in Table 2.

2.1.4 - Toxic Air Contaminants

A toxic air contaminant (TAC) is defined as an air pollutant which may cause or contribute to an increase in mortality or serious illness, or which may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air. However, their high toxicity or health risk may pose a threat to public health even at very low concentrations. For those TACs that may cause cancer, there is no concentration that does not present some risk. In other words, there is no threshold level below which adverse health impacts are not expected to occur. This contrasts with the criteria pollutants for which acceptable levels of exposure can be determined and for which the State and federal governments have set ambient air quality standards. The majority of the estimated health risk from TACs can be attributed to a relatively few compounds, the most important being PM from diesel-fueled engines and DPM. In addition to DPM, benzene and 1, 3-butadiene are also significant contributors to overall ambient public health risk in California.

Both SCAQMD and ARB have monitoring networks in the SoCAB that measure ambient concentrations of certain TACs that are associated with important health-related effects, and are present in appreciable concentrations in the SoCAB. The SCAQMD uses this information to determine health risks for a particular area. The ARB publishes annual Statewide, air basin, and location-specific summaries of the concentration levels of several TACs and their resulting cancer risks[3]. The most recent summary of TAC concentration levels and cancer risk is the ARB Air Quality Almanac for 2009 (ARB 2010a). The Almanac presents the relevant concentration and cancer risk data for the ten TACs that pose the most substantial health risk in California based on available data. These TACs are: acetaldehyde, benzene, 1, 3-butadiene, carbon tetrachloride, hexavalent chromium, para-dichlorobenzene, formaldehyde, methylene chloride, and perchloroethylene. DPM is not directly measured but is indirectly estimated based on fine

[3] Cancer risk is expressed as a probability of an individual out of a population of one million contracting cancer via a continuous exposure to TACs over a 70-year lifetime.

particulate matter measurements and special studies on the chemical speciation of ambient fine particulate data along with receptor modeling techniques. ARB estimates that 78 percent of the known statewide cancer risks are from the top 10 outdoor air toxics in addition to DPM.

Estimates of total cancer risk Statewide have shown a steady decline from the early 1990s when the cancer risk from DPM was estimated to be 1,696 in one million. By the year 2000, the cancer risk was estimated to be 1,005 in one million or a reduction of 41 percent. Reductions in cancer risk are expected to continue into the future as new emission controls are implemented that further reduce DPM emissions, the major component of the total airborne cancer risk. Table 3 provides this summary of TACs and health risk information from the ARB Annual Toxic Summary for the most recent three-year period, 2012-2014 for the Riverside-Rubidoux air monitoring station located approximately 23 miles west of the project site (ARB 2014a). The cancer risk attributable to the non-DPM chemicals (i.e., the 10 TACs measured by the ARB described above) have also shown significant reductions at the Rubidoux location declining from an estimated cancer risk of 429 in one million in 1990, to 121 in one million in 2011, a reduction of 72 percent.

Table 3: TAC Concentration Levels and Associated Health Risks - Riverside

TAC	Conc.[1]/Risk[2]	2012	2013	2014
Acetaldehyde	Annual Average Health Risk	1.39 7	1.27 6	1.17 6
Benzene	Annual Average Health Risk	0.32 30	0.31 28	0.29 27
1,3-Butadiene	Annual Average Health Risk	0.050 19	0.065 24	0.056 21
Carbon Tetrachloride	Annual Average Health Risk	0.084 22	0.082 22	0.097 26
Chromium, Hex	Annual Average Health Risk	0.030 5	0.58 9	0.070 6
Para-Dichlorobenzene	Annual Average Health Risk	ID ID	ID ID	ID ID
Formaldehyde	Annual Average Health Risk	3.70 27	3.57 26	3.56 26
Methylene Chloride	Annual Average Health Risk	2.41 8	1.33 5	1.49 5
Perchloroethylene	Annual Average Health Risk	0.020 0.8	0.022 0.9	0.026 1
Diesel PM	No monitoring data available			
	Total Health Risk (without DPM)	119	121	118

Notes:
[1] Concentrations for Hexavalent Chromium are expressed as ng/m^3, and concentrations for Diesel PM are expressed as µg/m^3. Concentrations for all other TACs are expressed as ppb.
[2] Health Risk represents the number of excess cancer cases per million people based on a lifetime (70-year) exposure to the annual average concentration. Total Health Risk represents only those compounds listed in this table and only those with data for the year. There may be other significant compounds for which monitoring and/or health risk information is not available.
ID = insufficient data
Source: ARB 2014a for the Riverside Rubidoux air monitoring station.

In addition to the measurements presented in the ARB almanac and the Annual Air Toxics Summary, the SCAQMD conducted a detailed TAC emission inventory, air sampling, and dispersion modeling study called the Multiple Air Toxics Exposure Study in the South Coast Air SoCAB (MATES-II) (SCAQMD 2000), (MATES-III) (SCAQMD 2008a), and MATES-IV (SCAQMD 2014). The MATES Studies provided information on the importance of various TACs in terms of their relative health risks as well as their spatial distribution across the SoCAB. The MATES-IV information can be used to characterize the "background" health risks from both regional and local TAC emission sources based on the available toxics emission inventory for the year 2012. The MATES-IV program results indicate that the cancer risks in the area where the project site is located are estimated to be 158 in one million, of which the DPM contributes approximately 68 percent of the total cancer risk. This cancer risk level is approximately 54 percent lower that the cancer risks estimated for the project site based on the MATES-III study that used the toxics emission inventory for the year 2005. Overall, the MATES IV study found that the population weighted cancer risk in the entire SoCAB was estimated to be 367 in one million. The MATES-IV population weighted cancer risk level represents a decrease of 57 percent from basin-wide the population weighted cancer risk of 853 in a million that was estimated in the MATES-III study. This sharp decline is attributable largely to emission reduction programs implemented by the SCAQMD, ARB, and USEPA particularly as regards DPM.

Some studies indicate that DPM poses the greatest health risk among the TACs listed above. A 10-year research program (ARB 1998) demonstrated that DPM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to DPM poses a chronic health risk. In addition to increasing the risk of lung cancer, exposure to diesel exhaust can have other health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. Diesel exhaust is a major source of ultrafine particulate pollution as well, and studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems.

Ultrafine particles are particulate matter that exists in the ambient air and are less than 0.1 micrometers (µm or microns) in diameter. Ultrafine particles (UFP or $PM_{0.1}$) are included in the group called $PM_{2.5}$, particulate matter less than 2.5 micrometers in diameter. The SCAQMD contains a detailed chapter on ultrafine particles in its 2012 Air Quality Management Plan (AQMP). The AQMP summarizes current health effect research. The potential health effects from ultrafine particle exposure are similar as with $PM_{2.5}$ and PM_{10}: adverse cardio-respiratory responses included elevated blood pressure, mild inflammatory and prothrombotic (obstruction of circulation) responses.

In its revisions to the national ambient air quality standards for particulate matter in January 2013, the United States Environmental Protection Agency (EPA) states that, "In considering both the currently available health effects evidence and the air quality data, the Policy Assessment concluded that this information was still too limited to provide support for consideration of a distinct PM standard for ultrafine particles."

The EPA indicates that evidence and research regarding health effects from short-term and long-term exposure to ultrafine particles are still too limited to establish a separate standard. In addition, the

EPA reports that the studies that do exist have reported inconsistent and mixed results. The following is an excerpt from the Federal Register in this regard:

> New evidence, primarily from controlled human exposure and toxicological studies, expands our understanding of cardiovascular and respiratory effects related to short-term ultrafine particle exposures. However, the Policy Assessment concluded that this evidence was still very limited and largely focused on exposure to diesel exhaust, for which the Integrated Science Assessment concluded it was unclear whether the effects observed are due to ultrafine particles, larger particles within the PM2.5 mixture, or the gaseous components of diesel exhaust. In addition, the Integrated Science Assessment noted uncertainties associated with the controlled human exposure studies using concentrated ambient particle systems, which have been shown to modify the composition of ultrafine particles.
>
> The Policy Assessment recognized that there are relatively few epidemiological studies that have examined potential cardiovascular and respiratory effects associated with short-term exposures to ultrafine particles. These studies have reported inconsistent and mixed results.
>
> Collectively, in considering the body of scientific evidence available in this review, the Integrated Science Assessment concluded that the currently available evidence was suggestive of a causal relationship between short-term exposures to ultrafine particles and cardiovascular and respiratory effects. Furthermore, the Integrated Science Assessment concluded that evidence was inadequate to infer a causal relationship between short-term exposure to ultrafine particles and mortality as well as long-term exposure to ultrafine particles and all outcomes evaluated. (EPA 2013)

The Integrated Science Assessment for Particulate Matter (EPA 2009a) summarized that evidence is inadequate to determine a causal relationship between short-term exposures of ultrafine particles to mortality or central nervous system effects, but that the evidence is suggestive of short-term exposures causing cardiovascular and respiratory effects. The Assessment also concluded that there is inadequate evidence linking long-term exposure of ultrafine particles to health effects, including respiratory, developmental, cancer, and mortality. Overall, epidemiological studies of atmospheric PM suggest that cardiovascular effects are associated with smaller particles, but there are few reports that make a clear link between ultrafine particulate exposures and increased mortality.

In its Quantitative Health Risk Assessment for Particulate Matter, the EPA did not assess ultrafine particles, stating “that there was insufficient data to support a quantitative risk assessment for other size fractions (e.g., ultrafine particles) (EPA 2010a).

The availability of measurements of ultrafine particles to support health studies is also limited as excerpted from the EPA discussion on the national ambient air quality standards for particulate matter (EPA 2013):

> With respect to our understanding of ambient ultrafine particle concentrations, at present, there is no national network of ultrafine particle samplers; thus, only episodic

> and/or site-specific data sets exist. Therefore, the Policy Assessment recognized a national characterization of concentrations, temporal and spatial patterns, and trends was not possible at this time, and the availability of ambient ultrafine measurements to support health studies was extremely limited. In general, measurements of ultrafine particles are highly dependent on monitor location and, therefore, more subject to exposure error than accumulation mode particles. Furthermore, the number of ultrafine particles generally decreases sharply downwind from sources, as ultrafine particles may grow into the accumulation mode by coagulation or condensation. Limited studies of ambient ultrafine particle measurements have suggested that these particles exhibit a high degree of spatial and temporal heterogeneity driven primarily by differences in nearby source characteristics. Internal combustion engines and, therefore, roadways are a notable source of ultrafine particles, so concentrations of these particles near roadways are generally expected to be elevated. Concentrations of ultrafine particles have been reported to drop off much more quickly with distance from roadways than fine particles. (EPA 2013).

In addition, it was hypothesized that chemical composition of PM may be a better predictor of health effects than particle size (EPA 2013):

> In addressing the issue of particle composition, the Integrated Science Assessment concluded that, ''[f]rom a mechanistic perspective, it is highly plausible that the chemical composition of PM would be a better predictor of health effects than particle size.'' Heterogeneity of ambient concentrations of $PM_{2.5}$ constituents (e.g., elemental carbon, organic carbon, sulfates, nitrates) observed in different geographical regions as well as regional heterogeneity in $PM_{2.5}$-related health effects reported in a number of epidemiological studies are consistent with this hypothesis. (EPA 2013).

However, some researchers have concluded that the risk from DPM is over exaggerated (Enstrom 2008). Moreover, the current methodological protocols required by SCAQMD and ARB when studying the health risk posed by DPM assume the following: (1) 24-hour constant exposure; (2) 350 days a year; (3) for a continuous period lasting 70 years. For example, most people are indoors for 18-20 hours a day (at their place of employment or home) and most people do not live in the same location for a 70-year period. Several studies have documented that less than 10 percent of households remain at the same location for more than 30 years (American Community Survey 2009, Israel and Nelson 1992, Johnson and Capel 1992, and USEPA 2011). Thus, the health risk assessments (HRA) prepared pursuant to these protocols overestimate the risk of cancer associated with DPM exposure.

DPM differs from other TACs in that it is not a single substance but a complex mixture of hundreds of substances. Although DPM is emitted by diesel-fueled, internal combustion engines, the composition of the emissions varies, depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present. Unlike the other TACs, however, no ambient monitoring data are available for DPM because no routine measurement method currently exists. The ARB has made preliminary concentration estimates based on a DPM exposure method. This method uses the ARB emissions inventory's PM_{10} database, ambient PM_{10} monitoring data, and the results from several studies to estimate concentrations of DPM. Within the

SoCAB, in addition to DPM, there are emissions of benzene, formaldehyde, acetaldehyde, naphthalene, ethylbenzene, acrolein, toluene, hexane, propylene, and xylene from a variety of sources located within the SoCAB that contribute to health.

2.2 - Regulatory Setting

Air pollutants are regulated at the national, state, and air basin level; each agency has a different level of regulatory responsibility. The United States EPA regulates at the national level, the ARB regulates at the state level, and the SCAQMD regulates at the air basin level.

2.2.1 - National and State

The EPA is responsible for national and interstate air pollution issues and policies. The EPA sets national vehicle and stationary source emission standards, oversees approval of all SIPs, provides research and guidance for air pollution programs, and sets National Ambient Air Quality Standards, also known as federal standards. There are federal standards for six common air pollutants, called criteria air pollutants, which were identified from provisions of the Clean Air Act of 1970. The criteria pollutants are:

- Ozone
- Nitrogen dioxide
- Lead
- Particulate matter (PM_{10} and $PM_{2.5}$)
- Carbon monoxide (CO)
- Sulfur dioxide

The federal standards were set to protect public health, including that of sensitive individuals; thus, the standards continue to change as more medical research is available regarding the health effects of the criteria pollutants. Primary federal standards are the levels of air quality necessary, with an adequate margin of safety, to protect the public health.

A SIP is a document prepared by each state describing existing air quality conditions and measures that will be followed to attain and maintain federal standards. The SIP for the State of California is administered by the ARB, which has overall responsibility for statewide air quality maintenance and air pollution prevention. California's SIP incorporates individual federal attainment plans for regional air districts. Each air district prepares their own federal attainment plan, which is then sent to ARB to be approved and incorporated into the California SIP. Federal attainment plans include the technical foundation for understanding air quality (e.g., emission inventories and air quality monitoring), control measures and strategies, and enforcement mechanisms.

The ARB also administers California Ambient Air Quality Standards (state standards) for the 10 air pollutants designated in the California Clean Air Act. The 10 state air pollutants are the six federal standards listed above as well visibility-reducing particulates, hydrogen sulfide, sulfates, and vinyl chloride.

The federal and State ambient air quality standards, relevant effects, properties, and sources of the pollutants are summarized in Table 4.

Table 4: Description of Air Pollutants

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Ozone	1 Hour	0.09 ppm	—	Irritate respiratory system; reduce lung function; breathing pattern changes; reduction of breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; increased mortality risk; vegetation and property damage.	Ozone is a photochemical pollutant as it is not emitted directly into the atmosphere, but is formed by a complex series of chemical reactions between volatile organic compounds (VOC), NO_X, and sunlight. Ozone is a regional pollutant that is generated over a large area and is transported and spread by the wind.	Ozone is a secondary pollutant; thus, it is not emitted directly into the lower level of the atmosphere. The primary sources of ozone precursors (VOC and NO_X) are mobile sources (on-road and off-road vehicle exhaust).
	8 Hour	0.070 ppm	0.075 ppm			
Carbon monoxide (CO)	1 Hour	20 ppm	35 ppm	Ranges depending on exposure: slight headaches; nausea; aggravation of angina pectoris (chest pain) and other aspects of coronary heart disease; decreased exercise tolerance in persons with peripheral vascular disease and lung disease; impairment of central nervous system functions; possible increased risk to fetuses; death.	CO is a colorless, odorless, toxic gas. CO is somewhat soluble in water; therefore, rainfall and fog can suppress CO conditions. CO enters the body through the lungs, dissolves in the blood, replaces oxygen as an attachment to hemoglobin, and reduces available oxygen in the blood.	CO is produced by incomplete combustion of carbon-containing fuels (e.g., gasoline, diesel fuel, and biomass). Sources include motor vehicle exhaust, industrial processes (metals processing and chemical manufacturing), residential wood burning, and natural sources.
	8 Hour	9.0 ppm	9 ppm			
Nitrogen dioxide [b] (NO_2)	1 Hour	0.18 ppm	0.100 ppm	Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; contribution to atmospheric discoloration; increased visits to hospital for respiratory illnesses.	During combustion of fossil fuels, oxygen reacts with nitrogen to produce nitrogen oxides - NO_X (NO, NO_2, NO_3, N_2O, N_2O_3, N_2O_4, and N_2O_5). NO_X is a precursor to ozone, PM_{10}, and $PM_{2.5}$ formation. NO_X can react with compounds to form nitric acid and related small particles and result in PM related health effects.	NO_X is produced in motor vehicle internal combustion engines and fossil fuel-fired electric utility and industrial boilers. Nitrogen dioxide forms quickly from NOx emissions. NO_2 concentrations near major roads can be 30 to 100 percent higher than those at monitoring stations.
	Annual	0.030 ppm	0.053 ppm			

CVAR_08658

Table 4 (cont.): Description of Air Pollutants

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Sulfur dioxide[c] (SO_2)	1 Hour	0.25 ppm	0.075 ppm	Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient sulfur dioxide levels. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.	Sulfur dioxide is a colorless, pungent gas. At levels greater than 0.5 ppm, the gas has a strong odor, similar to rotten eggs. Sulfur oxides (SO_X) include sulfur dioxide and sulfur trioxide. Sulfuric acid is formed from sulfur dioxide, which can lead to acid deposition and can harm natural resources and materials. Although sulfur dioxide concentrations have been reduced to levels well below state and federal standards, further reductions are desirable because sulfur dioxide is a precursor to sulfate and PM_{10}.	Human caused sources include fossil-fuel combustion, mineral ore processing, and chemical manufacturing. Volcanic emissions are a natural source of sulfur dioxide. The gas can also be produced in the air by dimethylsulfide and hydrogen sulfide. Sulfur dioxide is removed from the air by dissolution in water, chemical reactions, and transfer to soils and ice caps. The sulfur dioxide levels in the State are well below the maximum standards.
	3 Hour	—	0.5 ppm			
	24 Hour	0.04 ppm	0.14 (for certain areas)			
	Annual	—	0.030 ppm (for certain areas)			
Particulate matter (PM_{10})	24 hour	50 µg/m^3	150 µg/m^3	• Short-term exposure (hours/days): irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; those with heart disease can suffer heart attacks and arrhythmias. • Long-term exposure: reduced lung function; chronic bronchitis; changes in lung morphology; death.	Suspended particulate matter is a mixture of small particles that consist of dry solid fragments, droplets of water, or solid cores with liquid coatings. The particles vary in shape, size, and composition. PM_{10} refers to particulate matter that is between 2.5 and 10 microns in diameter, (1 micron is one-millionth of a meter). $PM_{2.5}$ refers to particulate matter that is 2.5 microns or less in diameter, about one-thirtieth the size of the average human hair.	Stationary sources include fuel or wood combustion for electrical utilities, residential space heating, and industrial processes; construction and demolition; metals, minerals, and petrochemicals; wood products processing; mills and elevators used in agriculture; erosion from tilled lands; waste disposal, and recycling. Mobile or transportation related sources are from vehicle exhaust and road dust. Secondary particles form from reactions in the atmosphere.
	Mean	20 µg/m^3	—			
Particulate matter ($PM_{2.5}$)	24 Hour	—	35 µg/m^3			
	Annual	12 µg/m^3	12 µg/m^3			
Visibility reducing particles	8 Hour	See note below [d]				

Table 4 (cont.): Description of Air Pollutants

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Sulfates	24 Hour	25 µg/m^3	—	(a) Decrease in ventilatory function; (b) aggravation of asthmatic symptoms; (c) aggravation of cardio-pulmonary disease; (d) vegetation damage; (e) degradation of visibility; (f) property damage.	The sulfate ion is a polyatomic anion with the empirical formula SO_4^{2-}. Sulfates occur in combination with metal and/or hydrogen ions. Many sulfates are soluble in water.	Sulfates are particulates formed through the photochemical oxidation of sulfur dioxide. In California, the main source of sulfur compounds is combustion of gasoline and diesel fuel.
Lead [e]	30-day	1.5 µg/m^3	—	Lead accumulates in bones, soft tissue, and blood and can affect the kidneys, liver, and nervous system. It can cause impairment of blood formation and nerve conduction, behavior disorders, mental retardation, neurological impairment, learning deficiencies, and low IQs.	Lead is a solid heavy metal that can exist in air pollution as an aerosol particle component. Leaded gasoline was used in motor vehicles until around 1970. Lead concentrations have not exceeded state or federal standards at any monitoring station since 1982.	Lead ore crushing, lead-ore smelting, and battery manufacturing are currently the largest sources of lead in the atmosphere in the United States. Other sources include dust from soils contaminated with lead-based paint, solid waste disposal, and crustal physical weathering.
	Quarter	—	1.5 µg/m^3			
	Rolling 3-month average	—	0.15 µg/m^3			
Vinyl chloride[e]	24 Hour	0.01 ppm	—	Short-term exposure to high levels of vinyl chloride in the air causes central nervous system effects, such as dizziness, drowsiness, and headaches. Epidemiological studies of occupationally exposed workers have linked vinyl chloride exposure to development of a rare cancer, liver angiosarcoma, and have suggested a relationship between exposure and lung and brain cancers.	Vinyl chloride, or chloroethene, is a chlorinated hydrocarbon and a colorless gas with a mild, sweet odor. In 1990, ARB identified vinyl chloride as a toxic air contaminant and estimated a cancer unit risk factor.	Most vinyl chloride is used to make polyvinyl chloride plastic and vinyl products, including pipes, wire and cable coatings, and packaging materials. It can be formed when plastics containing these substances are left to decompose in solid waste landfills. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites.
Hydrogen sulfide	1 Hour	0.03 ppm	—	High levels of hydrogen sulfide can cause immediate respiratory arrest. It can irritate the eyes and respiratory tract and cause headache, nausea, vomiting, and cough. Long exposure can cause pulmonary edema.	Hydrogen sulfide (H_2S) is a flammable, colorless, poisonous gas that smells like rotten eggs.	Manure, storage tanks, ponds, anaerobic lagoons, and land application sites are the primary sources of hydrogen sulfide. Anthropogenic sources include the combustion of sulfur containing fuels (oil and coal).

Table 4 (cont.): Description of Air Pollutants

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources
Volatile organic compounds (VOC)		There are no State or federal standards for VOCs because they are not classified as criteria pollutants.		Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations because of interference with oxygen uptake. In general, concentrations of VOCs are suspected to cause eye, nose, and throat irritation; headaches; loss of coordination; nausea; and damage to the liver, the kidneys, and the central nervous system. Many VOCs have been classified as toxic air contaminants.	Reactive organic gases (ROGs), or VOCs, are defined as any compound of carbon—excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate—that participates in atmospheric photochemical reactions. Although there are slight differences in the definition of ROGs and VOCs, the two terms are often used interchangeably.	Indoor sources of VOCs include paints, solvents, aerosol sprays, cleansers, tobacco smoke, etc. Outdoor sources of VOCs are from combustion and fuel evaporation. A reduction in VOC emissions reduces certain chemical reactions that contribute to the formulation of ozone. VOCs are transformed into organic aerosols in the atmosphere, which contribute to higher PM_{10} and lower visibility.
Diesel particulate matter (diesel PM)		There are no ambient air quality standards for diesel PM.		Some short-term (acute) effects of diesel PM exposure include eye, nose, throat, and lung irritation, coughs, headaches, light-headedness, and nausea. Studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks, and premature deaths among those suffering from respiratory problems. Human studies on the carcinogenicity of diesel PM demonstrate an increased risk of lung cancer, although the increased risk cannot be clearly attributed to diesel exhaust exposure.	Diesel PM is a source of $PM_{2.5}$ - diesel particles are typically 2.5 microns and smaller. Diesel exhaust is a complex mixture of thousands of particles and gases that is produced when an engine burns diesel fuel. Organic compounds account for 80 percent of the total particulate matter mass, which consists of compounds such as hydrocarbons and their derivatives, and polycyclic aromatic hydrocarbons and their derivatives. Fifteen polycyclic aromatic hydrocarbons are confirmed carcinogens, a number of which are found in diesel exhaust.	Diesel exhaust is a major source of ambient particulate matter pollution in urban environments. Typically, the main source of diesel PM is from combustion of diesel fuel in diesel-powered engines. Such engines are in on-road vehicles such as diesel trucks, off-road construction vehicles, diesel electrical generators, and various pieces of stationary construction equipment.

Table 4 (cont.): Description of Air Pollutants

Air Pollutant	Averaging Time	California Standard	Federal Standard[a]	Most Relevant Effects from Pollutant Exposure	Properties	Sources

Notes:
ppm = parts per million (concentration) µg/m^3 = micrograms per cubic meter Annual = Annual Arithmetic Mean 30-day = 30-day average Quarter = Calendar quarter

[a] Federal standard refers to the primary national ambient air quality standard, or the levels of air quality necessary, with an adequate margin of safety to protect the public health. All standards listed are primary standards except for 3 Hour SO_2, which is a secondary standard. A secondary standard is the level of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[b] To attain the 1-hour nitrogen dioxide national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (0.100 ppm).

[c] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[d] Visibility reducing particles: In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

[e] The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Source of effects, properties, and sources: SCAQMD 2007a; California Environmental Protection Agency 2002; ARB 2013; U.S. EPA 2003, 2009b, 2009c, 2010b, 2011a, and 2012; National Toxicology Program 2011a and 2011b.

Several pollutants listed in Table 4 are not addressed in this analysis. Analysis of lead is not included in this report because the project is not anticipated to emit lead. Visibility-reducing particles are not explicitly addressed in this analysis because particulate matter is addressed. The project is not expected to generate or be exposed to vinyl chloride because proposed project uses do not utilize the chemical processes that create this pollutant, and there are no such uses in the project vicinity. The project is not expected to cause exposure to hydrogen sulfide because it would not generate hydrogen sulfide in any substantial quantity.

Asbestos

Asbestos is listed as a TAC by ARB and as a Hazardous Air Pollutant by the EPA. Asbestos occurs naturally in surface deposits of several types of rock formations. Asbestos most commonly occurs in ultramafic rock that has undergone partial or complete alteration to serpentine rock (serpentinite) and often contains chrysotile asbestos. In addition, another form of asbestos, tremolite can be found associated with ultramafic rock, particularly near faults. Crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma.

There are no natural occurrences of asbestos in the project area (USGS 2011).

2.2.2 - South Coast Air Quality Management District

The agency for air pollution control for the SoCAB is the SCAQMD. The SCAQMD is responsible for controlling emissions primarily from stationary sources. The SCAQMD maintains air quality monitoring stations throughout the SoCAB. The SCAQMD is also responsible for developing, updating, and implementing the Air Quality Management Plan (AQMP) for the SoCAB, in coordination with the Southern California Association of Governments (SCAG). The SCAQMD also has roles under CEQA.

Air Quality Management Plans

An AQMP is a plan prepared and implemented by an air pollution district for a county or region designated as nonattainment of the federal and/or California ambient air quality standards. The term nonattainment area is used to refer to an air basin where one or more ambient air quality standards are exceeded.

2003 AQMP

One of the purposes of the 2003 AQMP is to lead the SoCAB and portions of the Salton Sea Air Basin under SCAQMD jurisdiction into compliance with the 1-hour ozone and PM_{10} federal standards (SCAQMD 2003). Another purpose of the 2003 AQMP is to lead the SoCAB into compliance of the federal 8-hour ozone and $PM_{2.5}$ standards.

The 2003 AQMP also replaced the 1997 attainment demonstration for the federal CO standard, provided a basis for a maintenance plan for CO for the future, and updated the maintenance plan for the federal nitrogen dioxide standard that the SoCAB has met since 1992 (2003 AQMP, page 1-1).

The 2003 AQMP also incorporated new scientific data in the form of updated emissions inventories, ambient measurements, new meteorological episodes, and new air quality modeling tools. The 2003 AQMP utilized complex modeling to show that with the control measures, the SoCAB would be in compliance with the federal and state standards for all pollutants by 2010, except for the state ozone and PM_{10} standards and the state ozone and PM_{10} standard after 2010 or by the earliest practicable date, as mandated by the California Health and Safety Code Section 40462. The ARB approved the 2003 AQMP on August 1, 2003. The EPA's adequacy finding on the emissions budgets for conformity determination in the SoCAB was published in the Federal Register (69 FR 15325-15326).

2007 AQMP

The 2007 AQMP was adopted by the SCAQMD on June 1, 2007 (SCAQMD 2007a). On July 13, 2007, the SCAQMD Board adopted the 2007 Final AQMP Transportation Conformity Budgets and directed the Executive Officer to forward them to ARB for its approval and subsequent submittal to the EPA. On September 27, 2007, ARB adopted the State Strategy for the 2007 SIP and the 2007 AQMP as part of the SIP. On January 15, 2009, the EPA's regional administrator signed a final rule to approve in part and disapprove in part the SCAQMD 2003 1-hour ozone plan, and the nitrogen dioxide maintenance plan. The parts of the plan that were approved strengthen the SIP. The Clean Air Act does not require the disapproved portions of the plan, and the disapprovals do not start sanctions clocks.

The 2007 AQMP outlines a detailed strategy for meeting the federal health-based standards for $PM_{2.5}$ by 2015, and 8-hour ozone by 2024 while accounting for and accommodating future expected growth. The 2007 AQMP incorporates significant new emissions inventories, ambient measurements, scientific data, control strategies, and air quality modeling. Most of the reductions will be from mobile sources, which are currently responsible for about 75 percent of all smog and particulate forming emissions. The 2007 AQMP includes 37 control measures proposed for adoption by the SCAQMD, including measures to reduce emissions from new commercial and residential developments, more reductions from industrial facilities, and reductions from wood burning fireplaces and restaurant charbroilers.

2012 AQMP

The 2012 AQMP was adopted December 7, 2012 (SCAQMD 2012a) and approved by the CARB on January 25, 2013. The purpose of the 2012 AQMP for the SoCAB is to set forth a comprehensive and integrated program that will lead the SoCAB into compliance with the federal 24-hour $PM_{2.5}$ air quality standard, and to provide an update of the SoCAB's projections in meeting the federal 8-hour ozone standards. On February 13, 2013, the AQMP was submitted to the U.S. EPA as the SIP for the federal 24-hour $PM_{2.5}$ standard and ozone standard. In addition, the AQMP will update specific elements of the previously approved 8-hour ozone SIP: 1) an updated emissions inventory and, 2) new control measures and commitments for emissions reductions to help fulfill the Section 182(e)(5) portion of the 8-hour

ozone SIP. The 2012 AQMP states, "The remarkable historical improvement in air quality since the 1970's is the direct result of Southern California's comprehensive, multiyear strategy of reducing air pollution from all sources as outlined in its AQMPs" (SCAQMD 2012, page ES-1).

The 2012 AQMP proposes Basin-wide $PM_{2.5}$ measures that will be implemented by the 2014 attainment date, episodic control measures to achieve air quality improvements (would only apply during high $PM_{2.5}$ days), Section 182(e)(5) implementation measures (to maintain progress towards meeting the 2023 8-hour ozone national standard), and transportation control measures. Most of the control measures focus on incentives, outreach, and education.

Proposed $PM_{2.5}$ reduction measures in the 2012 AQMP include the following:

- Further NOx reductions from RECLAIM
- Further reductions from residential wood burning devices
- Further reductions from open burning
- Emission reductions from under-fired charbroilers
- Further ammonia reductions from livestock waste
- Backstop measures for indirect sources of emissions from ports and port-related sources
- Further criteria pollutant reductions from education, outreach and incentives

There are multiple VOC and NOx reductions in the 2012 AQMP to attempt to reduce ozone formation, including further VOC reductions from architectural coatings, miscellaneous coatings, adhesives, solvents, lubricants, mold release products, and consumer products.

The 2012 AQMP also contains proposed mobile source implementation measures for the deployment of zero- and near-zero emission on-road heavy-duty vehicles, locomotives, and cargo handling equipment. There are measures for the deployment of cleaner commercial harborcraft, cleaner ocean-going marine vessels, cleaner off-road equipment, and cleaner aircraft engines.

The 2012 AQMP proposes the following mobile source implementation measures:

- On-road mobile sources:
  - Accelerated penetration of partial zero-emission and zero-emission vehicles. This measure proposes to continue incentives for the purchase of zero-emission vehicles and hybrid vehicles with a portion of their operation in an all-electric range mode. The state Clean Vehicle Rebate Pilot program is proposed to continue from 2015 to 2023 with a proposed funding for up to $5,000 per vehicle. The measure seeks to provide funding assistance for up to 1,000 zero-emission or partial-zero emission vehicles per year.
  - Accelerated penetration of partial zero-emission and zero-emission light-heavy and medium-heavy duty vehicles through funding assistance for purchasing the vehicles. The objective of the proposed action is to accelerate the introduction of advanced hybrid and zero-emission technologies for Class 4 through 6 heavy-duty vehicles. The state is currently implementing a Hybrid Vehicle Incentives Project program to promote zero-emission and hybrid heavy-duty vehicles. The proposed measure seeks to continue the program from 2015 to 2023, to deploy up to 1,000 zero- and partial-zero emission vehicles per year with up to $25,000

funding assistance per vehicle. Zero-emission vehicles and hybrid vehicles with a portion of their operation in an all-electric range mode would be given the highest priority.
- Accelerated retirement of older light-, medium-, and heavy-duty vehicles through funding incentives
- Further emission reductions from heavy-duty vehicles serving near-dock railyards through a proposed control measure that calls for a requirement that any cargo container moved between the Ports of Los Angeles and Long Beach to the nearby railyards by with zero-emission technologies

- Off-road mobile sources:
  - Extension of the SOON[4] provision for construction/industrial equipment, which provides funding to repower or replace older Tier 0 and Tier 1 equipment
  - Further emission reductions from freight and passenger locomotives calls for an accelerated use of Tier 4 locomotives in the SoCAB
  - Further emission reductions from ocean-going marine vessels while at berth
  - Emission reductions from ocean-going marine vessels

The 2012 AQMP also relies upon the SCAG regional transportation strategy, which is in its adopted 2012-2035 RTP/SCS and 2011 Federal Transportation Improvement Program, which contains the following sections:

1. Linking regional transportation planning to air quality planning: making sure that the regional transportation plan supports the goals and objectives of the AQMP/SIP.
2. Regional transportation strategy and transportation control measures: the RTP/SCS contains improvements to the regional multimodal transportation system including the following: active transportation (non-motorized transportation - biking and walking); transportation demand management; transportation system management; transit; passenger and high-speed rail; goods movement; aviation and airport ground access; highways; arterials; and operations and maintenance.
3. Reasonably available control measure analysis.

SCAQMD Rules

The AQMP for the SoCAB establishes a program of rules and regulations administered by SCAQMD to obtain attainment of the state and federal standards. The rules and regulations that apply to this project include, but are not limited to, the rules listed in the Standard Conditions section of this report.

CEQA

The SCAQMD has two roles under CEQA:

[4] The SCAQMD's Surplus Off-Road Opt-In for NOx (SOON) Program provides funding assistance to applicable fleets for the purchase of commercially available low-emission heavy-duty engines to achieve near-term reduction of NOx emissions from in-use off-road diesel vehicles. In 2008, the SCAQMD Board approved setting aside funding for this purpose. The SCAQMD is currently seeking off-road engine repower or vehicle replacement projects under the SOON Program.

1. Lead Agency: responsible for preparing environmental analyses for its own projects (adoption of rules, regulations, or plans) or permit projects filed with the SCAQMD where the SCAQMD has primary approval authority over the project.
2. Commenting Agency: the SCAQMD reviews and comments on air quality analyses prepared by other public agencies (such as the proposed project).

The SCAQMD also provides guidance and thresholds for CEQA air quality and greenhouse gas analyses. The result of this guidance as well as State regulations to control air pollution is an overall improvement in the SoCAB, as shown previously.

Local

In 2005, the Western Riverside Council of Governments published a guidance document referred to as the "Good Neighbor Guidelines for Siting New and/or Modified Warehouse/Distribution Facilities" (WRCOG 2005). This document recommends guidelines that provide local governments and developers with a menu of options or strategies that can reduce exposure to diesel particulate from new and/or modified warehouse or distribution centers. The Guidelines include seven goals, and a variety of strategies for each goal that can be implemented in whole or part. There are a variety of benefits associated with adopting the guidelines, such as reducing the exposure of residents and sensitive receptors to diesel emissions.

SECTION 3: CLIMATE CHANGE SETTING

3.1 - Climate Change

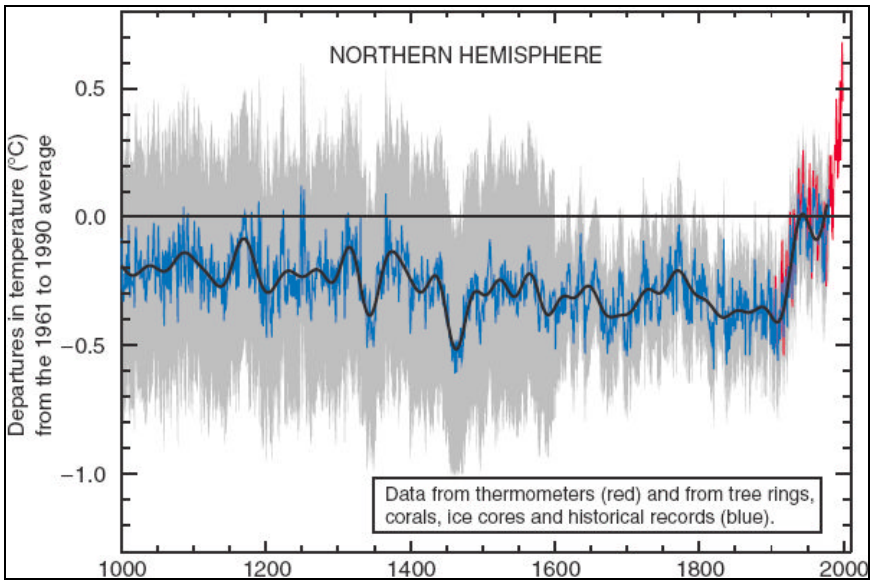
Climate change is a change in the average weather of the earth that is measured by alterations in wind patterns, storms, precipitation, and temperature. These changes are assessed using historical records of temperature changes occurring in the past, such as during previous ice ages. Many of the concerns regarding climate change use this data to extrapolate a level of statistical significance, specifically focusing on temperature records from the last 150 years (the Industrial Age) that differ from previous climate changes in rate and magnitude.

The United Nations Intergovernmental Panel on Climate Change (IPCC) constructed several emission trajectories of greenhouse gases needed to stabilize global temperatures and climate change impacts. In its Fourth Assessment Report, the IPCC predicted that the global mean temperature change from 1990 to 2100, given six scenarios, could range from 1.1 degrees Celsius (°C) to 6.4°C. Regardless of analytical methodology, global average temperatures and sea levels are expected to rise under all scenarios (IPCC 2007a). The report also concluded that "[w]arming of the climate system is unequivocal," and that "[m]ost of the observed increase in global average temperatures since the mid-20th century is very likely due to the observed increase in anthropogenic greenhouse gas concentrations."

The IPCC published its Fifth Assessment Report, which states something similar: "Warming of the climate system is unequivocal, and since the 1950s, many of the observed changes are unprecedented over decades to millennia. The atmosphere and ocean have warmed, the amounts of snow and ice have diminished, sea level has risen, and the concentrations of greenhouse gases have increased" (IPCC 2013, page 2). In addition, "Human influence on the climate system is clear. This is evident from the increasing greenhouse gas concentrations in the atmosphere, positive radiative forcing, observed warming, and understanding of the climate system" (IPCC 2013, page 13).

Some scientists disagree with the conclusions in the IPCC reports. There have been questions regarding the validity of the temperature graph used by the IPCC in some form in the Third and Fourth Assessment Reports. The graph is shown in Figure 1 (source IPCC 2001). The figure shows that temperatures were relatively stable until 1900, when temperatures increased rapidly. Some scientists have had trouble duplicating the data used for the graph (McIntyre and McKitrick 2003), and indicated when the data is correctly handled "shows the 20th century climate to be unexceptional compared to earlier centuries" (McKitrick 2005). Hans von Storch, a German climate scientist, claimed that the methods used by Mann et al. probably underestimated the temperature fluctuations in the past by a factor of two or more (Von Storch et al. 2004).

Figure 1: Historical Temperature Changes



Source: Intergovernmental Panel on Climate Change 2001.

3.1.1 - Consequences of Climate Change in California

In California, climate change may result in consequences such as the following (from California Climate Change Center 2006 and Moser et al. 2009).

- **A reduction in the quality and supply of water from the Sierra snowpack.** If heat-trapping emissions continue unabated, more precipitation will fall as rain instead of snow, and the snow that does fall will melt earlier, reducing the Sierra Nevada spring snowpack by as much as 70 to 90 percent. This can lead to challenges in securing adequate water supplies. It can also lead to a potential reduction in hydropower.
- **Increased risk of large wildfires.** If rain increases as temperatures rise, wildfires in the grasslands and chaparral ecosystems of southern California are estimated to increase by approximately 30 percent toward the end of the 21st century, because more winter rain will stimulate the growth of more plant "fuel" available to burn in the fall. In contrast, a hotter, drier climate could promote up to 90 percent more northern California fires by the end of the century by drying out and increasing the flammability of forest vegetation.
- **Reductions in the quality and quantity of certain agricultural products.** The crops and products likely to be adversely affected include wine grapes, fruit, nuts, and milk.
- **Exacerbation of air quality problems.** If temperatures rise to the medium warming range, there could be 75 to 85 percent more days with weather conducive to ozone formation in Los Angeles and the San Joaquin Valley, relative to today's conditions. This is more than twice the increase expected if rising temperatures remain in the lower warming range. This increase in air quality problems could result in an increase in asthma and other health-related problems.
- **A rise in sea levels resulting in the displacement of coastal businesses and residences.** During the past century, sea levels along California's coast have risen about seven inches. If

emissions continue unabated and temperatures rise into the higher anticipated warming range, sea level is expected to rise an additional 22 to 35 inches by the end of the century. Elevations of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats.

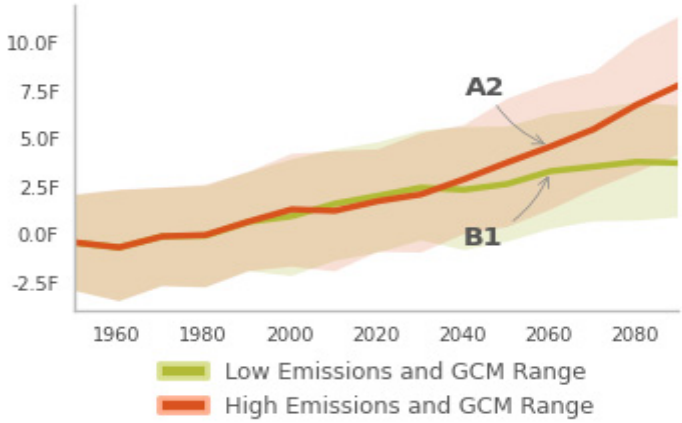
- **An increase temperature and extreme weather events.** Climate change is expected to lead to increases in the frequency, intensity, and duration of extreme heat events and heat waves in California. More heat waves can exacerbate chronic disease or heat-related illness.
- **A decrease in the health and productivity of California's forests.** Climate change can cause an increase in wildfires, an enhanced insect population, and establishment of non-native species.

Although some studies indicate that air quality will get worse with climate change, the IPCC's most recent report indicates that the range in projections of air quality (ozone and $PM_{2.5}$ in near-surface air) is driven primarily by emissions, rather than by physical climate change (IPCC 2013). In addition, the report indicates that there is high confidence that globally, warming decreases background surface ozone. However, locally higher surface temperatures in polluted regions can trigger regional feedbacks to increase levels of ozone and $PM_{2.5}$ (IPCC 2013).

3.1.2 - Consequences of Climate Change in Project Area

Climate change is predicted to impact geographical areas differently. The figure below displays a chart of measured historical and projected annual average temperatures in the project area. As shown in the figure, temperatures are expected to rise in the low and high greenhouse gas emissions scenarios.

Figure 2: Observed and Projected Temperature Changes



Source: CalAdapt 2014 for the Banning Area

3.2 - Greenhouse Gases

Gases that trap heat in the atmosphere are referred to as greenhouse gases. The effect is analogous to the way a greenhouse retains heat. Common greenhouse gases include water vapor, carbon dioxide, methane, nitrous oxides, chlorofluorocarbons, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, ozone, and aerosols. Natural processes and human activities emit greenhouse gases. The presence of greenhouse gases in the atmosphere affects the earth's temperature. It is believed that emissions from human activities, such as electricity production and vehicle use, have elevated the concentration of these gases in the atmosphere beyond the level of naturally occurring concentrations.

Climate change is driven by forcings and feedbacks. Radiative forcing is the difference between the incoming energy and outgoing energy in the climate system. Positive forcing tends to warm the surface while negative forcing tends to cool it. Radiative forcing values are typically expressed in watts per square meter. A feedback is a climate process that can strengthen or weaken a forcing. For example, when ice or snow melts, it reveals darker land underneath which absorbs more radiation and causes more warming. The global warming potential is the potential of a gas or aerosol to trap heat in the atmosphere. The global warming potential of a gas is essentially a measurement of the radiative forcing of a greenhouse gas compared with the reference gas, carbon dioxide.

Individual greenhouse gas compounds have varying global warming potential and atmospheric lifetimes. Carbon dioxide, the reference gas for global warming potential, has a global warming potential of one. The global warming potential of a greenhouse gas is a measure of how much a given mass of a greenhouse gas is estimated to contribute to global warming. To describe how much global warming a given type and amount of greenhouse gas may cause, the carbon dioxide equivalent is used. The calculation of the carbon dioxide equivalent is a consistent methodology for comparing greenhouse gas emissions since it normalizes various greenhouse gas emissions to a consistent reference gas, carbon dioxide. For example, methane's warming potential of 21 indicates that methane has 21 times greater warming affect than carbon dioxide on a molecule per molecule basis. A carbon dioxide equivalent is the mass emissions of an individual greenhouse gas multiplied by its global warming potential. Greenhouse gases defined by Assembly Bill (AB) 32 (see Section 3.3, Regulatory Environment for a description) include carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. They are described in Table 5.

Table 5: Description of Greenhouse Gases

Greenhouse Gas	Description and Physical Properties	Sources
Nitrous oxide	Nitrous oxide (laughing gas) is a colorless greenhouse gas. It has a lifetime of 114 years. Its global warming potential is 310.	Microbial processes in soil and water, fuel combustion, and industrial processes.
Methane	Methane is a flammable gas and is the main component of natural gas. It has a lifetime of 12 years. Its global warming potential is 21.	Methane is extracted from geological deposits (natural gas fields). Other sources are landfills, fermentation of manure, and decay of organic matter.

Table 5 (cont.): Description of Greenhouse Gases

Greenhouse Gas	Description and Physical Properties	Sources
Carbon dioxide	Carbon dioxide (CO_2) is an odorless, colorless, natural greenhouse gas. Carbon dioxide's global warming potential is 1. The concentration in 2005 was 379 parts per million (ppm), which is an increase of about 1.4 ppm per year since 1960.	Natural sources include decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources are from burning coal, oil, natural gas, and wood.
Chloro-fluorocarbons	These are gases formed synthetically by replacing all hydrogen atoms in methane or ethane with chlorine and/or fluorine atoms. They are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the earth's surface). Global warming potentials range from 3,800 to 8,100.	Chlorofluorocarbons were synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. They destroy stratospheric ozone. The Montreal Protocol on Substances that Deplete the Ozone Layer prohibited their production in 1987.
Hydro-fluorocarbons	Hydrofluorocarbons are a group of greenhouse gases containing carbon, chlorine, and at least one hydrogen atom. Global warming potentials range from 140 to 11,700.	Hydrofluorocarbons are synthetic manmade chemicals used as a substitute for chlorofluorocarbons in applications such as automobile air conditioners and refrigerants.
Perfluorocarbons	Perfluorocarbons have stable molecular structures and only break down by ultraviolet rays about 60 kilometers above Earth's surface. Because of this, they have long lifetimes, between 10,000 and 50,000 years. Global warming potentials range from 6,500 to 9,200.	Two main sources of perfluorocarbons are primary aluminum production and semiconductor manufacturing.
Sulfur hexafluoride	Sulfur hexafluoride is an inorganic, odorless, colorless, and nontoxic, nonflammable gas. It has a lifetime of 3,200 years. It has a high global warming potential, 23,900.	This gas is manmade and used for insulation in electric power transmission equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas.
Sources: Compiled from a variety of sources, primarily Intergovernmental Panel on Climate Change 2007a and Intergovernmental Panel on Climate Change 2007b.		

The State has begun the process of addressing pollutants referred to as short-lived climate pollutants. Senate Bill 605, approved by the Governor on September 14, 2014 requires the ARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants by January 1, 2016. ARB will complete an emission inventory of these pollutants, identify research needs, identify existing and potential new control measures that offer co-benefits, and coordinate with other state agencies and districts to develop measures. The draft emission inventory and strategy were released on September 30, 2015. No date for final adoption was located.

The short-lived climate pollutants include three main components: black carbon, fluorinated gases, and CH_4. Fluorinated gases and CH_4 are described in Table 3.7-1 and are already included in the

California GHG inventory. Black carbon has not been included in past GHG inventories; however, ARB will include it in its comprehensive strategy (ARB 2015c).

Ozone is another short-lived climate pollutant that will be part of the strategy. Ozone affects evaporation rates, cloud formation, and precipitation levels. Ozone is not directly emitted, so its precursor emissions, volatile organic compounds (VOC) and oxides of nitrogen (NO_x) on a regional scale and CH_4 on a hemispheric scale will be subject of the strategy (ARB 2015c).

Black carbon is a component of fine particulate matter. Black carbon is formed by incomplete combustion of fossil fuels, biofuels, and biomass. Sources of black carbon within a jurisdiction may include exhaust from diesel trucks, vehicles, and equipment, as well as smoke from biogenic combustion. Biogenic combustion sources of black carbon include the burning of biofuels used for transportation, the burning of biomass for electricity generation and heating, prescribed burning of agricultural residue, and natural and unnatural wildfires. Black carbon is not a gas but an aerosol—particles or liquid droplets suspended in air. Black carbon only remains in the atmosphere for days to weeks, whereas other GHGs that can remain in the atmosphere for years. Black carbon can be deposited on snow, where it absorbs sunlight, reduces sunlight reflectivity, and hastens snowmelt. Direct effects include absorbing incoming and outgoing radiation; indirectly, black carbon can also affect cloud reflectivity, precipitation, and surface dimming (cooling).

Global warming potentials for black carbon were not defined by the IPCC in its Fourth Assessment Report. The ARB has identified a global warming potential of 3,200 using a 20-year time horizon and 900 using a 100-year time horizon from the IPCC Fifth Assessment. Sources of black carbon are already regulated by ARB, and air district criteria pollutant and toxic regulations that control fine particulate emissions from diesel engines and other combustion sources (ARB 2015c). Additional controls on the sources of black carbon specifically for their GHG impacts beyond those required for toxic and fine particulates are not likely to be needed.

The project would emit black carbon through emissions of diesel PM during construction and operation. The South Coast Air Quality Management District does not currently recommend analyzing the effects of black carbon in California Environmental Quality Act documents based on limited data availability. This analysis does not estimate the emissions of black carbon.

Water vapor is also considered a GHG. Water vapor is an important component of our climate system and is not regulated. Increasing water vapor leads to warmer temperatures, which causes more water vapor to be absorbed into the air. Warming and water absorption increase in a spiraling cycle. Water vapor feedback can also amplify the warming effect of other greenhouse gases, such that the warming brought about by increased CO_2 allows more water vapor to enter the atmosphere (NASA 2015b).

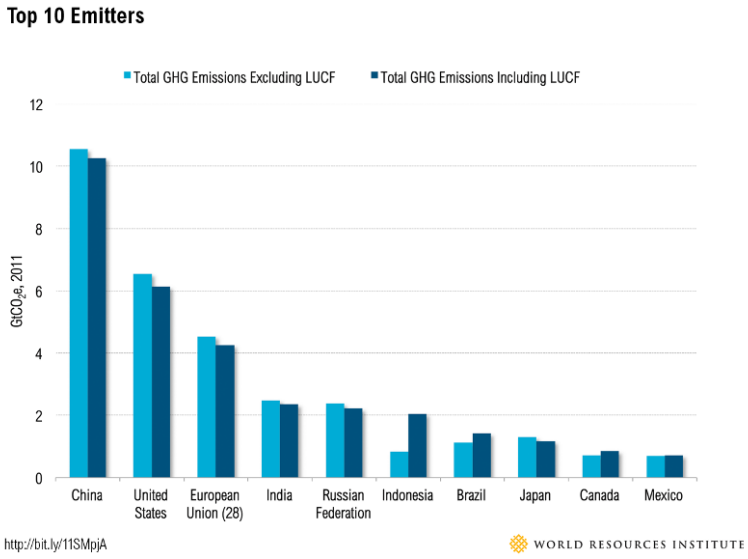
Although there could be health effects resulting from changes in the climate and the consequences that can bring about, inhalation of greenhouse gases at levels currently in the atmosphere would not result in adverse health effects, with the exception of ozone and aerosols (particulate matter). The potential health effects of ozone and particulate matter are discussed in criteria pollutant analyses. At very high indoor concentrations (not at levels existing outside), carbon dioxide, methane, sulfur

hexafluoride, and some chlorofluorocarbons can cause suffocation as the gases can displace oxygen (Centers for Disease Control and Prevention 2010, Occupational Safety and Health Administration 2003).

Emissions Inventories

An emissions inventory is a database that lists, by source, the amount of air pollutants discharged into the atmosphere of a geographic area during a given time period. Emissions worldwide were approximately 43,286 million metric tons of carbon dioxide equivalents (MMTCO2e) in 2012. As shown in Figure 3, China was the largest GHG emitter with over 10 billion metric tons of CO2e, and the United States was the second largest GHG emitter with over 6 billion metric tons of CO2e (WRI 2014).

Figure 3: Greenhouse Gas Emissions Trends



Source: WRI 2014

Figure 4 shows the contributors of GHG emissions in California between years 2000 and 2012 by economic sector. The main contributor was transportation. The second highest sector was industrial, which includes sources from refineries, general fuel use, oil and gas extraction, cement plants, and cogeneration heat output. ARB reported that California's GHG emissions inventory was 459 MMTCO2e in 2012 (ARB 2014a). .

Consequences of Climate Change in California

In California, climate change may result in consequences such as the following (from California

Climate Change Center 2006 and Moser et al. 2009):

- **A reduction in the quality and supply of water from the Sierra snowpack.** If heat-trapping emissions continue unabated, more precipitation will fall as rain instead of snow, and the snow that does fall will melt earlier, reducing the Sierra Nevada spring snowpack by as much as 70 to 90 percent. This can lead to challenges in securing adequate water supplies. It can also lead to a potential reduction in hydropower.

- **Increased risk of large wildfires.** If rain increases as temperatures rise, wildfires in the grasslands and chaparral ecosystems of southern California are estimated to increase by approximately 30 percent toward the end of the 21st century because more winter rain will stimulate the growth of more plant "fuel" available to burn in the fall. In contrast, a hotter, drier climate could promote up to 90 percent more northern California fires by the end of the century by drying out and increasing the flammability of forest vegetation.
- **Reductions in the quality and quantity of certain agricultural products.** The crops and products likely to be adversely affected include wine grapes, fruit, nuts, and milk.
- **Exacerbation of air quality problems.** If temperatures rise to the medium warming range, there could be 75 to 85 percent more days with weather conducive to ozone formation in Los Angeles and the San Joaquin Valley, relative to today's conditions. This is more than twice the increase that would be expected if rising temperatures remain in the lower warming range. This increase in ozone formation could result in an increase in asthma and other health-related problems.
- **A rise in sea levels resulting in the displacement of coastal businesses and residences.** During the past century, sea levels along California's coast have risen about seven inches. If emissions continue unabated and temperatures rise into the higher anticipated warming range, sea level is expected to rise an additional 22 to 35 inches by the end of the century. Elevations of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats.
- **An increase temperature and extreme weather events.** Climate change is expected to lead to increases in the frequency, intensity, and duration of extreme heat events and heat waves in California. More heat waves can exacerbate chronic disease or heat-related illness.
- **A decrease in the health and productivity of California's forests.** Climate change can cause an increase in wildfires, an enhanced insect population, and establishment of non-native species.

Human Health Effects of GHG Emissions

The cumulative effects to global climate change of GHG emissions have the potential to cause adverse effects to human health. Increases in Earth's ambient temperatures would result in more intense heat waves, causing more heat-related deaths. Scientists also purport that higher ambient temperatures would increase disease survival rates and result in more widespread disease. Climate change will likely cause shifts in weather patterns, potentially resulting in devastating droughts and food shortages in some areas. Although there could be health effects resulting from changes in the climate and the consequences that can occur, inhalation of GHGs at levels currently in the atmosphere would not result in adverse health effects, with the exception of ozone and aerosols (particulate matter). The potential health effects of ozone and particulate matter are discussed in criteria pollutant analyses. At very high indoor concentrations (not at levels existing outside), carbon dioxide, methane, sulfur hexafluoride, and some chlorofluorocarbons can cause suffocation as the gases can displace oxygen (CDC 2010 and OSHA 2003).

Figure 4: Greenhouse Gas Emission Trends by Sector in California

3.3 - Regulatory Environment

3.3.1 - International

Climate change is a global issue involving greenhouse gas emissions from all around the world; therefore, countries such as the ones discussed below have made an effort to reduce greenhouse gases.

Intergovernmental Panel on Climate Change. In 1988, the United Nations and the World Meteorological Organization established the Intergovernmental Panel on Climate Change to assess the scientific, technical and socio economic information relevant to understanding the scientific basis of risk of human-induced climate change, its potential impacts, and options for adaptation and mitigation.

United Nations Framework Convention on Climate Change (Convention). On March 21, 1994, the United States joined a number of countries around the world in signing the Convention. Under the Convention, governments gather and share information on GHG emissions, national policies, and best practices; launch national strategies for addressing GHG emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change.

Kyoto Protocol. The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions at average of five per cent against 1990 levels over the five-year period 2008–2012. The Convention (as discussed above) encouraged industrialized countries to stabilize emissions; however,

the Protocol commits them to do so. Developed countries have contributed more emissions over the last 150 years; therefore, the Protocol places a heavier burden on developed nations under the principle of "common but differentiated responsibilities."

In 2001, President George W. Bush indicated that he would not submit the treaty to the U.S. Senate for ratification, which effectively ended American involvement in the Kyoto Protocol. In December 2009, international leaders met in Copenhagen to address the future of international climate change commitments post-Kyoto. No binding agreement was reached in Copenhagen; however, the Committee identified the long-term goal of limiting the maximum global average temperature increase to no more than 2°C above pre-industrial levels, subject to a review in 2015. .The UN Climate Change Committee held additional meetings in Durban, South Africa in November 2011; Doha, Qatar in November 2012; and Warsaw, Poland in November 2013. The meetings are gradually gaining consensus among participants on individual climate change issues.

On September 23, 2014 more than 100 Heads of State and Government and leaders from the private sector and civil society met at the Climate Summit in New York hosted by the United Nations. At the Summit, heads of government, business and civil society announced actions in areas that would have the greatest impact on reducing emissions, including climate finance, energy, transport, industry, agriculture, cities, forests, and building resilience.

Parties to the U.N. Framework Convention on Climate Change (UNFCCC) reached a landmark agreement on December 12 in Paris, charting a fundamentally new course in the two-decade-old global climate effort. Culminating a four-year negotiating round, the new treaty ends the strict differentiation between developed and developing countries that characterized earlier efforts, replacing it with a common framework that commits all countries to put forward their best efforts and to strengthen them in the years ahead. . This includes, for the first time, requirements that all parties report regularly on their emissions and implementation efforts, and undergo international review.

The agreement and a companion decision by parties were the key outcomes of the conference, known as the 21st session of the UNFCCC Conference of the Parties, or COP 21. Together, the Paris Agreement and the accompanying COP decision:

- Reaffirm the goal of limiting global temperature increase well below 2 degrees Celsius, while urging efforts to limit the increase to 1.5 degrees;
- Establish binding commitments by all parties to make "nationally determined contributions" (NDCs), and to pursue domestic measures aimed at achieving them;
- Commit all countries to report regularly on their emissions and "progress made in implementing and achieving" their NDCs, and to undergo international review;
- Commit all countries to submit new NDCs every five years, with the clear expectation that they will "represent a progression" beyond previous ones;

- Reaffirm the binding obligations of developed countries under the UNFCCC to support the efforts of developing countries, while for the first time encouraging voluntary contributions by developing countries too;
- Extend the current goal of mobilizing $100 billion a year in support by 2020 through 2025, with a new, higher goal to be set for the period after 2025;
- Extend a mechanism to address "loss and damage" resulting from climate change, which explicitly will not "involve or provide a basis for any liability or compensation;"
- Require parties engaging in international emissions trading to avoid "double counting;" and
- Call for a new mechanism, similar to the Clean Development Mechanism under the Kyoto Protocol, enabling emission reductions in one country to be counted toward another country's NDC (C2ES 2015a).

National

Prior to the last decade, there have been no concrete federal regulations of GHGs or major planning for climate change adaptation. The following are actions regarding the federal government, GHGs, and fuel efficiency.

Greenhouse Gas Endangerment. Massachusetts v. EPA (Supreme Court Case 05-1120) decided on April 2, 2007, the Supreme Court found that four GHGs, including carbon dioxide, are air pollutants subject to regulation under Section 202(a)(1) of the Clean Air Act. The Court held that the Administrator must determine whether emissions of GHGs from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the Clean Air Act:

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases—carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride—in the atmosphere threaten the public health and welfare of current and future generations.
- Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution, which threatens public health and welfare.

These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing GHG emissions standards for vehicles, as discussed in the section "Clean Vehicles" below. After a lengthy legal challenge, the United States Supreme Court declined to review an Appeals Court ruling that upheld the EPA Administrator findings (EPA 2009b).

Clean Vehicles. Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all

new cars and trucks sold in the United States. On April 1, 2010, the EPA and the Department of Transportation's National Highway Safety Administration announced a joint final rule establishing a national program that would reduce GHG emissions and improve fuel economy for new cars and trucks sold in the United States.

The first phase of the national program applies to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. They require these vehicles to meet an estimated combined average emissions level of 250 grams of carbon dioxide per mile, equivalent to 35.5 miles per gallon if the automobile industry were to meet this carbon dioxide level solely through fuel economy improvements. Together, these standards would cut carbon dioxide emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). The EPA and the National Highway Safety Administration issued final rules on a second-phase joint rulemaking establishing national standards for light-duty vehicles for model years 2017 through 2025 in August 2012 (EPA 2012c). The new standards for model years 2017 through 2025 apply to passenger cars, light-duty trucks, and medium duty passenger vehicles. The final standards are projected to result in an average industry fleetwide level of 163 grams/mile of carbon dioxide (CO_2) in model year 2025, which is equivalent to 54.5 miles per gallon (mpg) if achieved exclusively through fuel economy improvements.

The EPA and the U.S. Department of Transportation issued final rules for the first national standards to reduce GHG emissions and improve fuel efficiency of heavy-duty trucks and buses on September 15, 2011, effective November 14, 2011. For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20-percent reduction in carbon dioxide emissions and fuel consumption by the 2018 model year. For heavy-duty pickup trucks and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10-percent reduction for gasoline vehicles and a 15-percent reduction for diesel vehicles by 2018 model year (12 and 17 percent respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles, the engine and vehicle standards would achieve up to a 10-percent reduction in fuel consumption and carbon dioxide emissions from the 2014 to 2018 model years.

Mandatory Reporting of Greenhouse Gases. The Consolidated Appropriations Act of 2008, passed in December 2007, requires the establishment of mandatory GHG reporting requirements. On September 22, 2009, the EPA issued the Final Mandatory Reporting of Greenhouse Gases Rule, which became effective January 1, 2010. The rule requires reporting of GHG emissions from large sources and suppliers in the United States, and is intended to collect accurate and timely emissions data to inform future policy decisions. Under the rule, suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions are required to submit annual reports to the EPA.

New Source Review. The EPA issued a final rule on May 13, 2010 that establishes thresholds for GHGs that define when permits under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule "tailors" the requirements of these Clean Air Act permitting programs to

limit which facilities will be required to obtain Prevention of Significant Deterioration and Title V permits. In the preamble to the revisions to the federal code of regulations, the EPA states:

> This rulemaking is necessary because without it the Prevention of Significant Deterioration and Title V requirements would apply, as of January 2, 2011, at the 100 or 250 tons per year levels provided under the Clean Air Act, greatly increasing the number of required permits, imposing undue costs on small sources, overwhelming the resources of permitting authorities, and severely impairing the functioning of the programs. EPA is relieving these resource burdens by phasing in the applicability of these programs to greenhouse gas sources, starting with the largest greenhouse gas emitters. This rule establishes two initial steps of the phase-in. The rule also commits the agency to take certain actions on future steps addressing smaller sources, but excludes certain smaller sources from Prevention of Significant Deterioration and Title V permitting for greenhouse gas emissions until at least April 30, 2016.

The EPA estimates that facilities responsible for nearly 70 percent of the national GHG emissions from stationary sources will be subject to permitting requirements under this rule. This includes the nation's largest GHG emitters—power plants, refineries, and cement production facilities.

Standards of Performance for Greenhouse Gas Emissions for New Stationary Sources: Electric Utility Generating Units. As required by a settlement agreement, the EPA proposed new performance standards for emissions of carbon dioxide for new, affected, fossil fuel-fired electric utility generating units on March 27, 2012. New sources greater than 25 megawatt would be required to meet an output based standard of 1,000 pounds of carbon dioxide per megawatt-hour, based on the performance of widely used natural gas combined cycle technology.

Cap and Trade. Cap and trade refers to a policy tool where emissions are limited to a certain amount and can be traded, or provides flexibility on how the emitter can comply. Successful examples in the United States include the Acid Rain Program and the NO_x Budget Trading Program and Clean Air Interstate Rule in the northeast. There is no federal GHG cap-and-trade program currently; however, some states have joined to create initiatives to provide a mechanism for cap and trade.

The Regional Greenhouse Gas Initiative is an effort to reduce GHGs among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont. Each state caps carbon dioxide emissions from power plants, auctions carbon dioxide emission allowances, and invests the proceeds in strategic energy programs that further reduce emissions, save consumers money, create jobs, and build a clean energy economy. The Initiative began in 2008.

The Western Climate Initiative partner jurisdictions have developed a comprehensive initiative to reduce regional GHG emissions to 15 percent below 2005 levels by 2020. The partners were originally California, British Columbia, Manitoba, Ontario, and Quebec. However, Manitoba and Ontario are not currently participating. California linked with Quebec's cap and trade system January 1, 2014 and joint offset auctions have taken place in 2015 (C2ES 2015).

SmartWay Program. The SmartWay Program is a public-private initiative between the EPA, large and small trucking companies, rail carriers, logistics companies, commercial manufacturers, retailers, and other federal and state agencies. Its purpose is to improve fuel efficiency and the environmental performance (reduction of both greenhouse gas emissions and air pollution) of the goods movement supply chains. SmartWay is comprised of four components (EPA 2014):

1. SmartWay Transport Partnership: A partnership in which freight carriers and shippers commit to benchmark operations, track fuel consumption, and improve performance annually.
2. SmartWay Technology Program: A testing, verification, and designation program to help freight companies identify equipment, technologies, and strategies that save fuel and lower emissions.
3. SmartWay Vehicles: A program that ranks light-duty cars and small trucks and identifies superior environmental performers with the SmartWay logo.
4. SmartWay International Interests: Guidance and resources for countries seeking to develop freight sustainability programs modeled after SmartWay.

SmartWay effectively refers to requirements geared towards reducing fuel consumption. Most large trucking fleets driving newer vehicles are compliant with SmartWay design requirements. Moreover, over time, all heavy-duty trucks will have to comply with the ARB Greenhouse Gas Regulation that is designed with the SmartWay Program in mind, to reduce greenhouse gas emissions by making them more fuel-efficient. For instance, in 2015, 53 foot or longer dry vans or refrigerated trailers equipped with a combination of SmartWay-verified low-rolling resistance tires and SmartWay-verified aerodynamic devices would obtain a total of 10 percent or more fuel savings over traditional trailers.

Through the SmartWay Technology Program, the EPA has evaluated the fuel saving benefits of various devices through grants, cooperative agreements, emissions and fuel economy testing, demonstration projects and technical literature review. As a result, the EPA has determined the following types of technologies provide fuel saving and/or emission reducing benefits when used properly in their designed applications, and has verified certain products:

- Idle reduction technologies – less idling of the engine when it is not needed would reduce fuel consumption.
- Aerodynamic technologies minimize drag and improve airflow over the entire tractor-trailer vehicle. Aerodynamic technologies include gap fairings that reduce turbulence between the tractor and trailer, side skirts that minimize wind under the trailer, and rear fairings that reduce turbulence and pressure drop at the rear of the trailer.
- Low rolling resistance tires can roll longer without slowing down, thereby reducing the amount of fuel used. Rolling resistance (or rolling friction or rolling drag) is the force resisting the motion when a tire rolls on a surface. The wheel will eventually slow down because of this resistance.
- Retrofit technologies include things such as diesel particulate filters, emissions upgrades (to a higher tier), etc., which would reduce emissions.
- Federal excise tax exemptions.

California

Legislative Actions to Reduce GHGs

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation such as the landmark AB 32 California Global Warming Solutions Act of 2006 was specifically enacted to address GHG emissions. Other legislation such as Title 24 and Title 20 energy standards were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major provisions of the legislation.

AB 32. The California State Legislature enacted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires that GHGs emitted in California be reduced to 1990 levels by the year 2020. "Greenhouse gases" as defined under AB 32 include carbon dioxide, methane, NO_x, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Since AB 32 was enacted, a seventh chemical, nitrogen trifluoride, has also been added to the list of GHGs. The California Air Resources Board (ARB) is the state agency charged with monitoring and regulating sources of GHGs. AB 32 states the following:

> Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems.

The ARB approved the 1990 GHG emissions level of 427 $MMTCO_2e$ on December 6, 2007 (ARB 2007). Therefore, emissions generated in California in 2020 are required to be equal to or less than 427 $MMTCO_2e$. Emissions in 2020 in a "business as usual"(BAU) scenario were estimated to be 596 $MMTCO_2e$, which do not account for reductions from AB 32 regulations (ARB 2008). At that level, a 28.4 percent reduction was required to achieve the 427 million $MTCO_2e$ 1990 inventory. In October 2010, ARB prepared an updated 2020 forecast to account for the recession and slower forecasted growth. The forecasted inventory without the benefits of adopted regulation is now estimated at 545 million $MTCO_2e$. Therefore, under the updated forecast, a 21.7 percent reduction from BAU is required to achieve 1990 levels (ARB 2010).

Progress in Achieving AB 32 Targets and Remaining Reductions Required

The State has made steady progress in implementing AB 32 and achieving targets included in Executive Order S-3-05. The progress is shown in updated emission inventories prepared by ARB for 2000 through 2012 (ARB 2014a). The State has achieved the Executive Order S-3-05 target for 2010 of reducing GHG emissions to 2000 levels. As shown below, the 2010 emission inventory achieved this target.

- 1990: 427 million $MTCO_2e$ (AB 32 2020 target)

- 2000: 463 million $MTCO_2e$ (an average 8-percent reduction needed to achieve 1990 base)
- 2010: 450 million $MTCO_2e$ (an average 5-percent reduction needed to achieve 1990 base)

The ARB has also made substantial progress in achieving its goal of achieving 1990 emissions levels by 2020. As described earlier in this section, ARB revised the 2020 BAU inventory forecast to account for new lower growth projections, which resulted in a new lower reduction from BAU to achieve the 1990 base. The previous reduction from 2020 BAU needed to achieve 1990 levels was 28.4 percent and the latest reduction from 2020 BAU is 21.7 percent.

- 2020: 545 million $MTCO_2e$ BAU (an average 21.7-percent reduction from BAU needed to achieve 1990 base)

ARB Scoping Plan. The ARB's Climate Change Scoping Plan (Scoping Plan) contains measures designed to reduce the State's emissions to 1990 levels by the year 2020 to comply with AB 32 (ARB 2008). The Scoping Plan identifies recommended measures for multiple GHG emission sectors and the associated emission reductions needed to achieve the year 2020 emissions target—each sector has a different emission reduction target. Most of the measures target the transportation and electricity sectors. As stated in the Scoping Plan, the key elements of the strategy for achieving the 2020 GHG target include:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
- Achieving a statewide renewables energy mix of 33 percent;
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system;
- Establishing targets for transportation-related GHG emissions for regions throughout California and pursuing policies and incentives to achieve those targets;
- Adopting and implementing measures pursuant to existing State laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard; and
- Creating targeted fees, including a public goods charge on water use, fees on high global warming potential gases, and a fee to fund the administrative costs of the State's long-term commitment to AB 32 implementation.

The ARB approved the First Update to the Scoping Plan (Update) on May 22, 2014. The Update identifies the next steps for California's climate change strategy. The Update shows how California continues on its path to meet the near-term 2020 GHG limit, but also sets a path toward long-term, deep GHG emission reductions. The report establishes a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050. The Update identifies progress made to meet the near-term objectives of AB 32 and defines California's climate change priorities and activities Climate for the next several years. The Update does not set new

targets for the State, but describes a path that would achieve the long term 2050 goal of Executive Order S-05-03 for emissions to decline to 80 percent below 1990 levels by 2050 (ARB 2014).

The ARB has no legislative mandate to set a target beyond the 2020 target from AB 32 or to adopt additional regulations to achieve a post-2020 target. The Update estimates that reductions averaging 5.2 percent per year would be required after 2020 to achieve the 2050 goal. The State Legislature is currently considering legislation (SB 32) that would set a target of a 40 percent reduction below 1990 levels by 2030. Until the legislation is enacted, no post-2020 mandate currently exists. With no estimate of future reduction commitments from the State, identifying a feasible strategy including plans and measures to be adopted by local agencies is not currently possible. The ARB has initiated preparation of a second update to the Scoping Plan to reflect the 2030 target established in Executive Order B-30-15 that should provide more details of the State's post-2020 reduction strategy, but would still require legislation to require actions beyond those by State agencies subject to the Executive Order.

Forecasting the amount of emissions that would occur in 2020 if no actions are taken was necessary to assess the amount of reductions California must achieve to return to the 1990 emissions level by 2020 as required by AB 32. The no-action scenario is known as "business-as-usual" or BAU. The ARB originally defined the BAU scenario as emissions in the absence of any GHG emission reduction measures discussed in the Scoping Plan.

As part of CEQA compliance for the Scoping Plan, ARB prepared a Supplemental Functional Equivalent Document (FED) in 2011. The FED included an updated 2020 BAU emissions inventory projection based on current economic forecasts (i.e., as influenced by the economic downturn) and emission reduction measures already in place, replacing its prior 2020 BAU emissions inventory. ARB staff derived the updated emissions estimates by projecting emissions growth, by sector, from the state's average emissions from 2006–2008. The new BAU estimate includes emission reductions for the million-solar-roofs program, the AB 1493 (Pavley I) motor vehicle GHG emission standards, and the Low Carbon Fuels Standard. In addition, ARB factored into the 2020 BAU inventory emissions reductions associated with 33-percent Renewable Energy Portfolio Standard (RPS) for electricity generation. The updated BAU estimate of 507 $MMTCO_2e$ by 2020 requires a reduction of 80 $MMTCO_2e$, or a 16-percent reduction below the estimated BAU levels to return to 1990 levels (i.e., 427 $MMTCO_2e$) by 2020.

In order to provide a BAU reduction that is consistent with the original definition in the Scoping Plan and with threshold definitions used in thresholds adopted by lead agencies for CEQA purposes and many climate action plans, the updated inventory without regulations was also included in the Supplemental FED. The ARB 2020 BAU projection for GHG emissions in California was originally estimated to be 596 $MMTCO_2e$. The updated ARB 2020 BAU projection in the Supplemental FED is 545 $MMTCO_2e$. Considering the updated BAU estimate of 545 $MMTCO_2e$ by 2020, ARB estimates a 21.7-percent reduction below the estimated statewide BAU levels is necessary to return to 1990 emission levels (i.e., 427 $MMTCO_2e$) by 2020, instead of the approximate 28.4-percent BAU reduction previously reported under the original Climate Change Scoping Plan (2008).

Cap and Trade Program. The Scoping Plan identifies a Cap-and-Trade Program as one of the key strategies for California to reduce GHG emissions. According to ARB, a cap-and-trade program will help put California on the path to meet its goal of reducing GHG emissions to 1990 levels by the year 2020 and ultimately achieving an 80-percent reduction from 1990 levels by 2050. Under cap-and-trade, an overall limit on GHG emissions from capped sectors is established, and facilities subject to the cap will be able to trade permits to emit GHGs within the overall limit.

ARB adopted a California Cap-and-Trade Program pursuant to its authority under AB 32. See 17 CCR §§ 95800 to 96023. The Cap-and-Trade Program is designed to reduce GHG emissions from major sources (deemed "covered entities") by setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32's emission-reduction mandate of returning to 1990 levels of emissions by 2020. The statewide cap for GHG emissions from the capped sectors (e.g., electricity generation, petroleum refining, and cement production) commenced in 2013 and will decline over time, achieving GHG emission reductions throughout the program's duration.

Covered entities that emit more than 25.000 $MTCO_2e$ per year must comply with the Cap-and-Trade Program. Triggering of the 25.000 $MTCO_2e$ per year "inclusion threshold" is measured against a subset of emissions reported and verified under the California Regulation for the Mandatory Reporting of Greenhouse Gas Emissions (Mandatory Reporting Rule or "MRR").

Under the Cap-and-Trade Program, ARB issues allowances equal to the total amount of allowable emissions over a given compliance period and distributes these to regulated entities. Covered entities are allocated free allowances in whole or part (if eligible), and may buy allowances at auction, purchase allowances from others, or purchase offset credits. Each covered entity with a compliance obligation is required to surrender "compliance instruments" 30 for each $MTCO_2e$ of GHG they emit. There also are requirements to surrender compliance instruments covering 30 percent of the prior year's compliance obligation by November of each year. For example. in November 2014, a covered entity was required to submit compliance instruments to cover 30 percent of its 2013 GHG emissions.

The Cap-and-Trade Program provides a firm cap, ensuring that the 2020 statewide emission limit will not be exceeded. An inherent feature of the Cap-and-Trade program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are only guaranteed on an accumulative basis. As summarized by ARB in the First Update:

> The Cap-and-Trade Regulation gives companies the flexibility to trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more have to turn in more allowances or other compliance instruments. Companies that can cut their GHG emissions have to turn in fewer allowances. But as the cap declines, aggregate emissions must be reduced. In other words, a covered entity theoretically could increase its GHG emissions every year and still comply with the Cap-and-Trade Program if there is a reduction in GHG emissions from other covered entities. Such a focus on aggregate GHG emissions is

> considered appropriate because climate change is a global phenomenon, and the effects of GHG emissions are considered cumulative (ARB 2014).

The Cap-and-Trade Program works with other direct regulatory measures and provides an economic incentive to reduce emissions. If California's direct regulatory measures reduce GHG emissions more than expected, then the Cap-and-Trade Program will be responsible for relatively fewer emissions reductions. If California's direct regulatory measures reduce GHG emissions less than expected, then the Cap-and-Trade Program will be responsible for relatively more emissions reductions. Thus. the Cap-and-Trade Program assures that California will meet its 2020 GHG emissions reduction mandate:

> The Cap-and-Trade Program establishes an overall limit on GHG emissions from most of the California economy—the "capped sectors." Within the capped sectors, some of the reductions are being accomplished through direct regulations, such as improved building and appliance efficiency standards, the [Low Carbon Fuel Standard] LCFS, and the 33 percent [Renewables Portfolio Standard] RPS. Whatever additional reductions are needed to bring emissions within the cap is accomplished through price incentives posed by emissions allowance prices. Together, direct regulation and price incentives assure that emissions are brought down cost-effectively to the level of the overall cap. The Cap-and-Trade Regulation provides assurance that California's 2020 limit will be met because the regulation sets a firm limit on 85 percent of California's GHG emissions. In sum, the Cap-and-Trade Program will achieve aggregate, rather than site specific or project-level, GHG emissions reductions. Also, due to the regulatory architecture adopted by ARB in AB 32, the reductions attributed to the Cap-and-Trade Program can change over time depending on the State's emissions forecasts and the effectiveness of direct regulatory measures (ARB 2014).

As of January 1, 2015, the Cap-and-Trade Program covered approximately 85 percent of California's GHG emissions. The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program.

The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period. While the Cap-and-Trade Program technically covered fuel suppliers as early as 2012, they did not have a compliance obligation (i.e., they were not fully regulated) until 2015. The Cap-and-Trade Program covers the GHG emissions associated with the combustion of transportation fuels in California, whether refined in-state or imported. The point of regulation for transportation fuels is when they are "supplied" (i.e., delivered into commerce). Accordingly, as with stationary source GHG emissions and GHG emissions attributable to electricity use, virtually all, if not all, of GHG emissions from CEQA projects associated with vehicle-miles traveled (VMT) are covered by the Cap-and-Trade Program (ARB 2015).

In addition, the Scoping Plan differentiates between "capped" and "uncapped" strategies. "Capped" strategies are subject to the proposed cap-and-trade program. The Scoping Plan states that the inclusion of these emissions within the cap-and trade program will help ensure that the year 2020 emission targets are met despite some degree of uncertainty in the emission reduction estimates for any individual measure. Implementation of the capped strategies is calculated to achieve a sufficient amount of reductions by 2020 to achieve the emission target contained in AB 32. "Uncapped" strategies that will not be subject to the cap-and-trade emissions caps and requirements are provided as a margin of safety by accounting for additional greenhouse gas emission reductions.[5]

SB 375 - the Sustainable Communities and Climate Protection Act of 2008. Passing the Senate on August 30, 2008, Senate Bill (SB) 375 was signed by the Governor on September 30, 2008. According to SB 375, the transportation sector is the largest contributor of GHG emissions, which emits over 40 percent of the total GHG emissions in California. SB 375 states, "Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32." SB 375 does the following: it (1) requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, (2) aligns planning for transportation and housing, and (3) creates specified incentives for the implementation of the strategies.

Concerning CEQA, SB 375, as codified in Public Resources Code Section 21159.28 states that CEQA findings determinations for certain projects are not required to reference, describe, or discuss (1) growth inducing impacts or (2) any project-specific or cumulative impacts from cars and light-duty truck trips generated by the project on global warming or the regional transportation network if the project:

1. Is in an area with an approved sustainable communities strategy or an alternative planning strategy that the ARB accepts as achieving the greenhouse gas emission reduction targets.
2. Is consistent with that strategy (in designation, density, building intensity, and applicable policies).
3. Incorporates the mitigation measures required by an applicable prior environmental document.

AB 1493 Pavley Regulations and Fuel Efficiency Standards. California AB 1493, enacted on July 22, 2002, required the ARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Implementation of the regulation was delayed by lawsuits filed by automakers and by the EPA's denial of an implementation waiver. The EPA subsequently granted the requested waiver in 2009, which was upheld by the U.S. District Court for the District of Columbia in 2011.

[5] On March 17, 2011, the San Francisco Superior Court issued a final decision in *Association of Irritated Residents v. California Air Resources Board* (Case No. CPF-09-509562). While the Court upheld the validity of the ARB Scoping Plan for the implementation of AB 32, the Court enjoined ARB from further rulemaking under AB 32 until ARB amends its CEQA environmental review of the Scoping Plan to address the flaws identified by the Court. On May 23, 2011, ARB filed an appeal. On June 24, 2011, the Court of Appeal granted ARB's petition staying the trail court's order pending consideration of the appeal. In the interest of informed decision-making, on June 13, 2011, ARB released the expanded alternatives analysis in a draft Supplement to the AB 32 Scoping Plan Functional Equivalent Document. The ARB Board approved the Scoping Plan and the CEQA document on August 24, 2011.

The standards phase in during the 2009 through 2016 model years. When fully phased in, the near-term (2009–2012) standards will result in about a 22-percent reduction compared with the 2002 fleet, and the mid-term (2013–2016) standards will result in about a 30-percent reduction. Several technologies stand out as providing significant reductions in emissions at favorable costs. These include discrete variable valve lift or camless valve actuation to optimize valve operation rather than relying on fixed valve timing and lift as has historically been done; turbocharging to boost power and allow for engine downsizing; improved multi-speed transmissions; and improved air conditioning systems that operate optimally, leak less, and/or use an alternative refrigerant.

The second phase of the implementation for the Pavley bill was incorporated into Amendments to the Low-Emission Vehicle Program referred to as LEV III or the Advanced Clean Cars program. The Advanced Clean Car program combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of requirements for model years 2017 through 2025. The regulation will reduce GHGs from new cars by 34 percent from 2016 levels by 2025. The new rules will clean up gasoline and diesel-powered cars, and deliver increasing numbers of zero-emission technologies, such as full battery electric cars, newly emerging plug-in hybrid electric vehicles and hydrogen fuel cell cars. The package will also ensure adequate fueling infrastructure is available for the increasing numbers of hydrogen fuel cell vehicles planned for deployment in California.

SB 1368 – Emission Performance Standards. In 2006, the State Legislature adopted SB 1368, which was subsequently signed into law by the Governor. SB 1368 directs the California Public Utilities Commission to adopt a performance standard for GHG emissions for the future power purchases of California utilities. SB 1368 seeks to limit carbon emissions associated with electrical energy consumed in California by forbidding procurement arrangements for energy longer than 5 years from resources that exceed the emissions of a relatively clean, combined cycle natural gas power plant. Because of the carbon content of its fuel source, a coal-fired plant cannot meet this standard because such plants emit roughly twice as much carbon as natural gas, combined cycle plants. Accordingly, the new law will effectively prevent California's utilities from investing in, otherwise financially supporting, or purchasing power from new coal plants located in or out of the State. Thus, SB 1368 will lead to dramatically lower GHG emissions associated with California's energy demand, as SB 1368 will effectively prohibit California utilities from purchasing power from out-of-state producers that cannot satisfy the performance standard for GHG emissions required by SB 1368. The California Public Utilities Commission adopted the regulations required by SB 1368 on August 29, 2007. The regulations implementing SB 1368 establish a standard for baseload generation owned by, or under long-term contract to publicly owned utilities, of 1,100 lbs CO_2 per megawatt-hour (MWh).

SB 1078 – Renewable Electricity Standards. On September 12, 2002, Governor Gray Davis signed SB 1078 requiring California to generate 20 percent of its electricity from renewable energy by 2017. SB 1078 changed the due date to 2010 instead of 2017. On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewable Portfolio Standard target for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020. Governor Schwarzenegger also directed the ARB (Executive Order S-21-09) to adopt a regulation by July 31, 2010, requiring the State's load serving entities to meet a 33

percent renewable energy target by 2020. The ARB Board approved the Renewable Electricity Standard on September 23, 2010 by Resolution 10-23.

SBX 7-7 – The Water Conservation Act of 2009. The legislation directs urban retail water suppliers to set individual 2020 per capita water use targets and begin implementing conservation measures to achieve those goals. Meeting this statewide goal of 20 percent decrease in demand will result in a reduction of almost 2 million acre-feet in urban water use in 2020 and related reduction in energy use for transporting and treating water.

SB 350— Clean Energy and Pollution Reduction Act of 2015. The legislature recently approved and the Governor signed SB 350, which reaffirms California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the renewables portfolio standard (RPS), higher energy efficiency requirements for buildings, initial strategies towards a regional electricity grid, and improved infrastructure for electric vehicle charging stations. Provisions for a 50 percent reduction in the use of petroleum statewide were removed from the Bill because of opposition and concern that it would prevent the Bill's passage. Specifically, SB 350 requires the following to reduce statewide GHG emissions:

- Increase the amount of electricity procured from renewable energy sources from 33 percent to 50 percent by 2030, with interim targets of 40 percent by 2024, and 25 percent by 2027.
- Double the energy efficiency in existing buildings by 2030. This target will be achieved through the California Public Utility Commission (CPUC), the California Energy Commission (CEC), and local publicly owned utilities.
- Reorganize the Independent System Operator (ISO) to develop more regional electrify transmission markets and to improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States (California Leginfo 2015).

Executive Orders Related to GHG Emissions

California's Executive Branch has taken several actions to reduce GHGs through the use of Executive Orders. Although not regulatory, they set the tone for the state and guide the actions of state agencies.

Executive Order S-3-05. Former California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S 3-05, the following reduction targets for GHG emissions:

- By 2010, reduce greenhouse gas emissions to 2000 levels.
- By 2020, reduce greenhouse gas emissions to 1990 levels.
- By 2050, reduce greenhouse gas emissions to 80 percent below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

Executive Order S-01-07 – Low Carbon Fuel Standard. The Governor signed Executive Order S 01-07 on January 18, 2007. The order mandates that a statewide goal shall be established to reduce the

carbon intensity of California's transportation fuels by at least 10 percent by 2020. In particular, the executive order established a Low Carbon Fuel Standard and directed the Secretary for Environmental Protection to coordinate the actions of the California Energy Commission, the ARB, the University of California, and other agencies to develop and propose protocols for measuring the "life-cycle carbon intensity" of transportation fuels. This analysis supporting development of the protocols was included in the State Implementation Plan for alternative fuels (State Alternative Fuels Plan adopted by California Energy Commission on December 24, 2007) and was submitted to ARB for consideration as an "early action" item under AB 32. The ARB adopted the Low Carbon Fuel Standard on April 23, 2009.

The Low Carbon Fuel Standard was challenged in the United States District Court in Fresno in 2011. The court's ruling issued on December 29, 2011 included a preliminary injunction against ARB's implementation of the rule. The Ninth Circuit Court of Appeals stayed the injunction on April 23, 2012 pending final ruling on appeal, allowing the ARB to continue to implement and enforce the regulation. The Ninth Circuit Court's decision filed September 18, 2013, vacated the preliminary injunction. In essence, the court held that Low Carbon Fuel Standards adopted by ARB were not in conflict with federal law. On August 8, 2013, the Fifth District Court of Appeal (California) ruled ARB failed to comply with CEQA and the Administrative Procedure Act (APA) when adopting regulations for Low Carbon Fuel Standards. In a partially published opinion, the Court of Appeal reversed the trial court's judgment and directed issuance of a writ of mandate setting aside Resolution 09-31 and two executive orders of ARB approving Low Carbon Fuel Standards (LCFS) regulations promulgated to reduce GHG emissions. However, the court tailored its remedy to protect the public interest by allowing the LCFS regulations to remain operative while ARB complies with the procedural requirements it failed to satisfy.

To address the Court ruling, ARB was required to bring a new LCFS regulation to the Board for consideration in February 2015. The proposed LCFS regulation was required to contain revisions to the 2010 LCFS as well as new provisions designed to foster investments in the production of the low-CI fuels, offer additional flexibility to regulated parties, update critical technical information, simplify and streamline program operations, and enhance enforcement. The second public hearing was held on September 24, 2015 and September 25, 2015 where the LCFS Regulation was adopted. The Final Rulemaking Package adopting the regulation was filed with Office of Administrative Law (OAL) on October 2, 2015. OAL has until November 16, 2015 to make a determination (ARB 2015d).

Executive Order S-13-08. Executive Order S-13-08 states that "climate change in California during the next century is expected to shift precipitation patterns, accelerate sea level rise and increase temperatures, thereby posing a serious threat to California's economy, to the health and welfare of its population and to its natural resources." Pursuant to the requirements in the order, the 2009 California Climate Adaptation Strategy (California Natural Resources Agency 2009) was adopted, which is the ". . . first statewide, multi-sector, region-specific, and information-based climate change adaptation strategy in the United States." Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

Executive Order B-30-15. On April 29, 2015, Governor Edmund G. Brown Jr. issued an executive order to establish a California greenhouse gas reduction target of 40 percent below 1990 levels by 2030. The Governor's executive order aligns California's greenhouse gas reduction targets with those of leading international governments ahead of the United Nations Climate Change Conference in Paris late 2015. The executive order sets a new interim statewide greenhouse gas emission reduction target to reduce greenhouse gas emissions to 40 percent below 1990 levels by 2030 in order to ensure California meets its target of reducing greenhouse gas emissions to 80 percent below 1990 levels by 2050 and directs the ARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of CO_2 equivalent ($MMCO_2e$). The executive order also requires the state's climate adaptation plan to be updated every three years and for the state to continue its climate change research program, among other provisions. As with Executive Order S-3-05, this executive order is not legally enforceable for local governments and the private sector. Legislation that would update AB 32 to make post 2020 targets and requirements a mandate is in process in the State Legislature.

California Regulations and Building Codes

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

Title 20 Appliance Efficiency Standards. California Code of Regulations, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations regulates the sale of appliances in California. The Appliance Efficiency Regulations include standards for both federally regulated appliances and non-federally regulated appliances. Twenty-three categories of appliances are included in the scope of these regulations. The standards within these regulations apply to appliances that are sold or offered for sale in California, except those sold wholesale in California for final retail sale outside the state and those designed and sold exclusively for use in recreational vehicles or other mobile equipment (CEC 2012).

Title 24 Energy Efficiency Standards and California Green Building Standards. California Code of Regulations Title 24 Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings, was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The newest version of Title 24 was adopted by the California Energy Commission (CEC) on May 31, 2012 and became effective on July 1, 2014.

The California Energy Commission (CEC) indicates that the 2013 Title 24 standards will reduce energy consumption by 30 percent above that achieved by 2008 Title 24 (CEC 2012). More specifically, based on a comparison of 2008 to 2013 Title 24 reductions required, newly constructed non-residential buildings result in an overall reduction of approximately 22 percent energy demand, while non-residential redevelopment (which would apply to existing buildings) results in an overall reduction of only approximately 10 percent energy demand. Additionally, the 2013 Title 24

CVAR_08691

standards currently in effect yield an approximately 68 percent energy savings when compared with the 2005 Title 24 standards (in place pre-AB 32)[6].

At this time, the 2013 Title 24 standards are currently in effect; notwithstanding, it is likely that by the time the building permits are processed for this Project, the 2016 Title 24 standards will be in effect (the 2016 Title 24 standards take effect on January 1, 2017). The analysis did not take any credit for implementation of the more restrictive 2016 Title 24 standards for which the CEC estimates will provide 5 percent electric energy savings from non-residential buildings compared to 2013 Title 24.[7]

California Code of Regulations, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect January 1, 2011 administered by the California Building Standards Commission. The code is updated on a regular basis, with the most recent update consisting of the 2013 California Green Building Code Standards that became effective January 1, 2014. Local jurisdictions are permitted to adopt more stringent requirements, as state law provides methods for local enhancements. The Code recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they establish a minimum 50-percent diversion requirement. The code also provides exemptions for areas not served by construction and demolition recycling infrastructure. The State Building Code provides the minimum standard that buildings must meet in order to be certified for occupancy, which is generally enforced by the local building official. The California Green Building Standards Code requires:

- Short-term bicycle parking. If a commercial project is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5 percent of visitor motorized vehicle parking capacity, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. For buildings with over 10 tenant-occupants, provide secure bicycle parking for 5 percent of tenant-occupied motorized vehicle parking capacity, with a minimum of one space (5.106.4.1.2).
- Designated parking. Provide designated parking in commercial projects for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage and collection of nonhazardous materials for recycling (5.410.1).
- Construction waste. A minimum 50-percent diversion of construction and demolition waste from landfills, increasing voluntarily to 65 and 80 percent for new homes and 80-percent for

See Table 2: Summary of First-Year-Electricity Savings in the California Energy Commission's Consultant Report: Impact Analysis California's 2013 Building Energy Efficiency Standards, July 2013.*

[7] See CEC 2015. 2016 Building Energy Efficiency Standards Adoption Hearing Presentation. Website: http://www.energy.ca.gov /title24/2016standards/rulemaking/documents/2015-06-10_hearing/2015-06-10_Adoption_Hearing_Presentation.pdf. Accessed May 11, 2016.

commercial projects (5.408.1, A5.408.3.1 [nonresidential], A5.408.3.1 [residential]). All (100 percent) of trees, stumps, rocks and associated vegetation and soils resulting from land clearing shall be reused or recycled (5.408.3).

- Wastewater reduction. Each building shall reduce the generation of wastewater by one of the following methods:
  - The installation of water-conserving fixtures or
  - Using nonpotable water systems (5.303.4).
- Water use savings. 20-percent mandatory reduction in indoor water use with voluntary goal standards for 30, 35 and 40-percent reductions (5.303.2, A5303.2.3 [nonresidential]).
- Water meters. Separate water meters for buildings in excess of 50,000 square feet or buildings projected to consume more than 1,000 gallons per day (5.303.1).
- Irrigation efficiency. Moisture-sensing irrigation systems for larger landscaped areas (5.304.3).
- Materials pollution control. Low-pollutant emitting interior finish materials such as paints, carpet, vinyl flooring, and particleboard (5.404).
- Building commissioning. Mandatory inspections of energy systems (i.e., heat furnace, air conditioner, mechanical equipment) for nonresidential buildings over 10,000 square feet to ensure that all are working at their maximum capacity according to their design efficiencies (5.410.2).

Model Water Efficient Landscape Ordinance. The Model Water Efficient Landscape Ordinance (Ordinance) was required by AB 1881, the Water Conservation Act. The bill required local agencies to adopt a local landscape ordinance at least as effective in conserving water as the Model Ordinance by January 1, 2010. Reductions in water use of 20 percent consistent with (SBX-7-7) 2020 mandate are expected upon compliance with the ordinance. Governor Brown's Drought Executive Order of April 1, 2015 (EO B-29-15) directed DWR to update the Ordinance through expedited regulation. The California Water Commission approved the revised Ordinance on July 15, 2015 effective December 15, 2015. New development projects that include landscape areas of 500 square feet or more are subject to the Ordinance. The update requires:

- More efficient irrigation systems
- Incentives for graywater usage
- Improvements in on-site stormwater capture
- Limiting the portion of landscapes that can be planted with high water use plants
- Reporting requirements for local agencies.

ARB Refrigerant Management Program. The ARB adopted a regulation in 2009 to reduce refrigerant GHG emissions from stationary sources through refrigerant leak detection and monitoring, leak repair, system retirement and retrofitting, reporting and recordkeeping, and proper refrigerant cylinder use, sale, and disposal. The regulation is set forth in sections 95380 to 95398 of Title 17, California Code of Regulations. The rules implementing the regulation establish a limit on statewide GHG emissions from stationary facilities with refrigeration systems with more than 50 pounds of a high GWP refrigerant. The refrigerant management program is designed to (1) reduce emissions of

high-GWP GHG refrigerants from leaky stationary, non-residential refrigeration equipment; (2) reduce emissions from the installation and servicing of refrigeration and air-conditioning appliances using high-GWP refrigerants; and (3) verify GHG emission reductions.

Tractor-Trailer Greenhouse Gas Regulation. The tractors and trailers subject to this regulation must either use EPA SmartWay certified tractors and trailers, or retrofit their existing fleet with SmartWay verified technologies. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. These owners are responsible for replacing or retrofitting their affected vehicles with compliant aerodynamic technologies and low rolling resistance tires. Sleeper cab tractors model year 2011 and later must be SmartWay certified. All other tractors must use SmartWay verified low rolling resistance tires. There are also requirements for trailers to have low rolling resistance tires and aerodynamic devices.

SB 97 and the CEQA Guidelines Update. Passed in August 2007, SB 97 added Section 21083.05 to the Public Resources Code. The code states "(a) On or before July 1, 2009, the Office of Planning and Research shall prepare, develop, and transmit to the Resources Agency guidelines for the mitigation of GHG emissions or the effects of GHG emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption. (b) On or before January 1, 2010, the Resources Agency shall certify and adopt guidelines prepared and developed by the Office of Planning and Research pursuant to subdivision (a)." Section 21097 was also added to the Public Resources Code. It provided CEQA protection until January 1, 2010 for transportation projects funded by the Highway Safety, Traffic Reduction, Air Quality, and Port Security Bond Act of 2006 or projects funded by the Disaster Preparedness and Flood Prevention Bond Act of 2006, in stating that the failure to analyze adequately the effects of GHGs would not violate CEQA.

On April 13, 2009, the Office of Planning and Research submitted to the Secretary for Natural Resources its recommended amendments to the CEQA Guidelines for addressing GHG emissions. On July 3, 2009, the Natural Resources Agency commenced the Administrative Procedure Act rulemaking process for certifying and adopting these amendments pursuant to Public Resources Code section 21083.05. Following a 55-day public comment period and two public hearings, the Natural Resources Agency proposed revisions to the text of the proposed Guidelines amendments. The Natural Resources Agency transmitted the adopted amendments and the entire rulemaking file to the Office of Administrative Law on December 31, 2009. On February 16, 2010, the Office of Administrative Law approved the Amendments, and filed them with the Secretary of State for inclusion in the California Code of Regulations. The Amendments became effective on March 18, 2010.

The CEQA Amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in CEQA documents. The CEQA Amendments fit within the existing CEQA framework by amending existing CEQA Guidelines to reference climate change.

A new section, CEQA Guidelines Section 15064.4, was added to assist agencies in determining the significance of GHG emissions. The new section allows agencies the discretion to determine whether a quantitative or qualitative analysis is best for a particular project. However, little guidance

is offered on the crucial next step in this assessment process—how to determine whether the project's estimated GHG emissions are significant or cumulatively considerable.

Also amended were CEQA Guidelines Sections 15126.4 and 15130, which address mitigation measures and cumulative impacts respectively. GHG mitigation measures are referenced in general terms, but no specific measures are championed. The revision to the cumulative impact discussion requirement (Section 15130) simply directs agencies to analyze GHG emissions in an EIR when a project's incremental contribution of emissions may be cumulatively considerable, however it does not answer the question of when emissions are cumulatively considerable.

Section 15183.5 permits programmatic GHG analysis and later project-specific tiering, as well as the preparation of Greenhouse Gas Reduction Plans. Compliance with such plans can support a determination that a project's cumulative effect is not cumulatively considerable, according to proposed Section 15183.5(b).

In addition, the amendments revised Appendix F of the CEQA Guidelines, which focuses on Energy Conservation. The sample environmental checklist in Appendix G was amended to include GHG questions.

Regional

The project is within the SoCAB, which is under the jurisdiction of the SCAQMD.

South Coast Air Quality Management District

The SCAQMD is the agency responsible for air quality planning and regulation in the SoCAB. For greenhouse gases, the agency addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency if they are the only agency having discretionary approval for the project and a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

The SCAQMD formed a working group to identify greenhouse gas emissions thresholds for land use projects that could be used by local lead agencies in the air basin in 2008. The working group developed several different options that are contained in the SCAQMD Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold, that could be applied by lead agencies. The working group has not provided additional guidance since release of the interim guidance in 2008. The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by the lead agency in adopting its own threshold. The current interim thresholds consist of the following tiered approach:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.

- Tier 2 consists of determining whether the project is consistent with a greenhouse gas reduction plan. If a project is consistent with a qualifying local greenhouse gas reduction plan, it does not have significant greenhouse gas emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project is less than significant:
  - All land use types: 3,000 $MTCO_2e$ per year
  - Based on land use type: residential: 3,500 $MTCO_2e$ per year; commercial: 1,400 $MTCO_2e$ per year; or mixed use: 3,000 $MTCO_2e$ per year
- Tier 4 has the following options:
  - Option 1: Reduce BAU emissions by a certain percentage; this percentage is currently undefined.
  - Option 2: Early implementation of applicable AB 32 Scoping Plan measures
  - Option 3, 2020 target for service populations (SP), which includes residents and employees: 4.8 $MTCO_2e$/SP/year for projects and 6.6 $MTCO_2e$/SP/year for plans;
  - Option 3, 2035 target: 3.0 $MTCO_2e$/SP/year for projects and 4.1 $MTCO_2e$/SP/year for plans
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The SCAQMD's draft threshold uses the Executive Order S-3-05 year 2050 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap carbon dioxide concentrations at 450 ppm, thus stabilizing global climate.

The SCAQMD only has authority over GHG emissions from development projects that include air quality permits. The project does not include stationary sources of emissions subject to SCAQMD permit; however, the SCAQMD has adopted a regulation that includes voluntary programs that are available for use in CEQA compliance.

SCAQMD Regulation XXVII, adopted in 2009 includes the following rules:

- Rule 2700 defines terms and post global warming potentials.
- Rule 2701, SoCal Climate Solutions Exchange, establishes a voluntary program to encourage, quantify, and certify voluntary, high quality certified greenhouse gas emission reductions in the SCAQMD.
- Rule 2702, Greenhouse Gas Reduction Programcreated a program to produce GHG emission reductions within the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

Local

The County of Riverside adopted a Climate Action Plan (CAP) on December 8, 2015. The CAP was part of the County's General Plan and contains further guidance on Riverside County's GHG Inventory reduction goals, policies, guidelines, and implementation programs. In particular, the CAP

elaborates on the General Plan goals and policies relative to GHG emissions and provides a specific implementation tool to guide future decisions of the County.

As part of the CAP, the County of Riverside published a guidance document titled "Greenhouse Gas Emissions, Screening Tables, County of Riverside, California" (December 2015). As part of this guidance, the County determined the size of development that is too small to be able to provide the level of GHG emission reductions expected from the Screening Tables or alternate emissions analysis method. The County's analysis determined that the 3,000 $MTCO_2e$ per year value be used in defining small projects that, when combined with modest energy efficiency measures shown in the bullet points below are considered less than significant and do not need to use the Screening Tables or alternative calculations. The efficiency measures required of small projects are summarized below:

- Energy efficiency at least five percent greater than 2010 Title 24 requirements, and
- Water conservation measures that matches the California Green Building Code in effect as of January 2011.

If the project exceeds the 3,000 $MTCO_2e$ per year threshold, then project emissions would need to be reduced by 25 percent from year 2011 emissions levels or alternatively the Project would need to achieve a minimum of 100 points pursuant to the CAP Screening Tables. The screening tables also allow developers to tailor their mitigation measures to the project's needs, rather than have them be subject to one-size fits all mitigation measures that may be too stringent for them.

The CAP Screening Table (CAP Appendix F) includes a discussion of how the 100 point minimum relates to the County's emission reduction target. In order to correctly allocate the emission reductions within the Screening Table, the amount of emission reductions afforded new development was segregated out of the aggregate total. Once the process of segregating new development out of the aggregate reduction totals was completed, the points were then proportioned by residential unit or square feet of commercial/industrial uses. This was accomplished by taking the predicted growth in households and commercial/industrial uses by the year 2020 and proportioning the appropriate Implementation Measure reduction quantities for new development to the residential and commercial/industrial land use sectors within the Screening Table. These calculations result in point values that are allocated by residential unit or commercial/industrial square footage (measured in 1000 sq.ft.). Because of this, the size of the project is not relevant to the Screening Table. Regardless of size, each project needs to garnish 100 points to demonstrate consistency with the Technical Report. Efficiency, not size of the Project is critical.

Therefore, projects that achieve at least 100 points are determined to be consistent with the reduction quantities anticipated in the County's GHG Technical Report. As such, further project-specific GHG quantification is not required. Consistent with CEQA guidelines, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

SECTION 4: AIR QUALITY AND HEALTH RISK SIGNIFICANCE THRESHOLDS

4.1 - CEQA Guidelines

The basic purposes of CEQA are to:

- Inform governmental decision makers and the public about the potential significant environmental effects of proposed activities;
- Identify ways that environmental damage can be avoided or significantly reduced;
- Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds changes to be feasible; and
- Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.

The following significance thresholds were derived from Appendix G of the CEQA guidelines. A significant impact would occur if the proposed project would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or protected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; or
- Create objectionable odors affecting a substantial number of people.

CEQA guidelines define a significant effect on the environment as "a substantial, or potentially substantial, adverse change in the environment." To determine if a proposed project would have a significant impact on air quality, the type, level, and impact of emissions generated by the proposed project must be evaluated. CEQA Guidelines Section 15064.7 provides that lead agencies are encouraged to adopt and/or apply "thresholds of significance." For this purpose, the significance thresholds recommended by the SCAQMD as the expert commenting agency were applied to this project and are discussed below.

4.2 - SCAQMD Significance Thresholds

To assist in the establishment of a quantitative determination of what is considered "significant," the SCAQMD has published a number of significance thresholds that apply to new projects constructed or operated within the SCAQMD. The SCAQMD recommends that lead agencies apply these

thresholds in determining whether a proposed project would result in a significant air quality impact. If the lead agency finds that a proposed project has the potential to exceed these air pollution thresholds, the project would be considered significant. These thresholds have been defined by SCAQMD for the SoCAB, based on scientific data the SCAQMD has obtained and factual data within the federal and State Clean Air Acts. Since the project is located within the SoCAB, these thresholds are applicable to this project. The SCAQMD has defined thresholds for NO_2, VOC, Oxides of Sulfur (SO_x), CO, PM_{10}, and $PM_{2.5}$, hereinafter referred to as "criteria" pollutants, and for health risk in terms of cancer and non-cancer risk.

From the perspective of this analysis, four types of significance thresholds were evaluated in terms of impacts on air quality from the construction and operation of the project. These thresholds are the Regional Significance Thresholds, Local Significance Thresholds, Health Risk Significance Thresholds, and CO "Hot Spot" Thresholds, which are discussed below.

4.2.1 - Regional Significance Thresholds

The SCAQMD has regional significance thresholds for VOC, NO_x, SO_x, CO, PM_{10}, and $PM_{2.5}$. Projects located within the SoCAB with construction or operational-related emissions in excess of any of the thresholds presented in Table 6 would be considered significant.

Table 6: SCAQMD Regional Thresholds

Pollutant	Construction (pounds per day)	Operation (pounds per day)
Oxides of Nitrogen (NO_x)	100	55
Reactive Organic Gases (VOC)	75	55
Particulate Matter (PM_{10})	150	150
Particulate Matter ($PM_{2.5}$)	55	55
Oxides of Sulfur (SO_x)	150	150
Carbon Monoxide (CO)	550	550
Source: South Coast Air Quality Management District, SCAQMD 2012b.		

4.2.2 - Local Significance Thresholds (LSTs)

Local Significance Thresholds (LSTs) were developed in response to the SCAQMD Governing Board's environmental justice (EJ) initiatives (EJ initiative I-4) in recognition of the fact that criteria pollutants such as CO, NO_x, and PM_{10} and $PM_{2.5}$ in particular, can have local impacts as well as regional impacts. The goal of significance thresholds is to ensure that no source creates, or receptor endures, a significant adverse impact from any project. The evaluation of localized air quality impacts determines the potential of the project to violate any air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. LSTs represent the maximum emissions or air concentrations from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or State ambient

air quality standard, at any nearby sensitive or worker receptor. LSTs are defined separately for construction and operational activities.

The SCAQMD LST methodology provides two approaches for performing the LST analysis. For projects of 5 acres or less where emissions would occur, the SCAQMD has developed a series of look up tables that provide estimates of daily construction or operational emissions above which a project's emissions are determined to have a significant air quality impact. These emission LSTs are provided for each combination of pollutants (CO, NO_2, PM_{10}, and $PM_{2.5}$), Source-Receptor Area (SRA), size of the project emission area, and distance to the nearest sensitive receptor. Projects where emissions occur over an area larger than 5 acres, the localized significance impacts for construction and operation emissions can be derived by either applying the LSTs for a 5-acre area, or by performing air dispersion modeling. Thus, the primary determinants for the LST assessment, therefore, are the SRA where the project is located, the size of the emission area, and distance to the nearest sensitive receptor.

The project is located in SRA 29 (Banning Airport). Therefore, the LSTs for this SRA were selected for the LST assessment. The project size is generally represented as the maximum area disturbed during a day from which emissions are calculated.

Construction

For construction activities, the highest level of onsite emissions generally occurs during the mass grading activities. The CalEEMod manual identifies various equipment and the acreage disturbed in an 8-hour day. Based on the construction equipment inventory to be provided in Table 11 below, a maximum area of six acres would be disturbed in a day based on the use of six scrapers that disturb an area of one acre each in an 8-hour day. For purposes of this LST assessment and to provide a conservative estimate of construction emissions, the emissions from the project's 6 acres were compared to the LST emission significance thresholds for a 5-acre area, the largest area contained in the SCAQMD lookup tables.

There are a number of existing residences in close proximity to the project. The closest existing residences are located near the southeast corner of the project along Cherry Valley Boulevard and are included in Table 7.

Table 7: Locations of Sensitive Receptors

Receptor Address	Location Relative to Project[1]	Type of Receptor
36240 Cherry Valley Boulevard	0.40 mile northwest	Existing Residential
37101 Cherry Valley Boulevard	0.51 mile east	Existing Residential
37251 Cherry Valley Boulevard	0.55 mile east	Existing Residential
37255 Cherry Valley Boulevard	0.66 mile east	Existing Residential
37275 Cherry Valley Boulevard	0.69 mile east	Existing Residential

Table 7 (cont.): Locations of Sensitive Receptors

Receptor Address	Location Relative to Project[1]	Type of Receptor
37303 Cherry Valley Boulevard	0.73 mile east	Existing Residential
37345 Cherry Valley Boulevard	0.84 miles east	Existing Residential
37321 Cherry Valley Boulevard	0.75 mile east	Existing Residential
9865 Roberts Street	0.57 mile northeast	Existing Residential
9975 Roberts Street	0.64 mile northeast	Existing Residential
Sunny Cal Specific Plan	0.02 mile south	Future Residential (457 single-family units)
Holbert Ranch	0.34 mile north	Future Residential (131 single-family units)
Tournament Hills Elementary School	1.1 miles south	School
Brookside Elementary School	2.30 miles southeast	School
Beaumont High School	2.51 miles southeast	School
Bornstine Property	0.02 miles east	Future Residential (209 single family units)
Sunset Ranch	0.4 miles northwest	Future Residential (231 single family units)

Note:
[1] Relative to the intersection of Street 2 and Cherry Valley Boulevard.

Based on a review of the existing and proposed sensitive receptors, the shortest distances to any existing or proposed sensitive receptor is 25 meters as the distance to the future residences located within the proposed Sunny Cal Specific Plan are directly across Cherry Valley Boulevard south from the project site.

The SCAQMD has issued guidance on applying CalEEMod to LSTs. Since CalEEMod calculates construction emissions based on the number of equipment hours and the maximum daily soil disturbance activity possible for each piece of equipment, the information in Table 11 below is used to determine the maximum daily disturbed-acreage for comparison to LSTs. To ensure consistency with LST modeling of construction-source emissions provided herein, maximum use of Project construction equipment types and their hours of operation (during grading activity) are limited as follows:

- **Grading:** Scrapers 6 pieces of equipment each disturbing 1 acre per 8-hour day

Based on the above disturbance rate, the project would result in a maximum of 6 acres disturbed during peak construction activity on any given day. The SCAQMD LST mass emission tables do not provide construction emission significance thresholds for a disturbed area of greater than 5 acres. Therefore, to provide a conservative estimate of construction emission significance thresholds, the emission thresholds for a 5 acre disturbed area were used in the assessment. This estimate is based

on the construction equipment assumptions embedded in the CalEEMod defaults and represent a reasonable approximation of the expected construction fleet as required per CEQA guidelines. Site specific construction fleet may vary due to specific project needs at the time of construction.

Based on the project's location, daily construction emission area, and distance to nearest sensitive receptor, the relevant construction significance thresholds for the project are summarized in Table 8.

Table 8: SCAQMD Localized Significance Thresholds - Construction

Pollutant[1]	Daily Emission Limit (pounds per day)[2]
CO	2,817
NO_x	236
PM_{10}	21
$PM_{2.5}$	11

Notes:
[1] The SCAQMD has defined LSTs only for these pollutants
[2] LSTs defined for SRA 29, 5 acre area and a 25 meter distance to the nearest sensitive receptor
Source: SCAQMD 2009.

Operation

For project operations, since the daily emission area covering the buildings and associated parking lots and driveways is much greater than 5 acres, the LST operational assessment was accomplished using air dispersion modeling. In this approach, the air quality impact from the operation of the project is determined using an air dispersion model for NO_2 and CO, is added to the highest ambient air quality levels in a project area (i.e., the background air quality), and the total impact is then compared to the most restrictive ambient air quality standard for NO_2 and CO. If the total air quality impact exceeds the most stringent ambient air quality standard for these pollutants, then the project would be considered to have a significant air quality impact. Thus, the LST concentration thresholds for a project are derived by ensuring that the total concentrations (background plus project contributions) are less than the most stringent standards. For PM_{10} and $PM_{2.5}$, since the SCAQMD currently exceeds the state or federal ambient air quality standards for these pollutants, the relevant LSTs prescribed by the SCAQMD are based on the allowable change in concentration thresholds contained in SCAQMD Rule 1303. Table 9 provides a summary of the project's operational LSTs.

Table 9: SCAQMD Localized Significance Thresholds - Operations

Pollutant	Averaging Time	Significance Threshold
Nitrogen Dioxide (NO_2)	1-hour (State) 1-hour (National)[1] Annual	0.18 ppm 0.10 ppm 0.03 ppm
Carbon Monoxide (CO)	1-hour 8 hour	20 ppm 9 ppm

Table 9 (cont.): SCAQMD Localized Significance Thresholds - Operations

Pollutant	Averaging Time	Significance Threshold
PM_{10} - Operations	24-hour Annual	2.5 μg/m^3 1.0 μg/m3
$PM_{2.5}$ - Operations	24-hour	2.5 μg/m3

Note:
[1] The SCAQMD has not included the federal NO_2 standard in its listing of LSTs; however, this standard has been included in the assessment.
Source: South Coast Air Quality Management District, 2012b.

The SCAQMD has also defined localized significance thresholds for sulfur dioxide, sulfate, and lead. The project, however, is expected to emit insignificant amounts of these pollutants.

4.2.3 - Health Risk Significant Thresholds

In addition to the thresholds established above for pollutants, the SCAQMD has also defined health risk thresholds. These thresholds are represented as a cancer risk to the public and a non-cancer hazard from exposures to TACs. Cancer risk represents the probability (in terms of risk per million individuals) that an individual would contract cancer resulting from exposure to TACs continuously over a period of 70 years for sensitive receptors. Thus, an individual located in an area with a cancer risk of one would experience a one chance out of a population of one million of contracting cancer over a 70-year time period, assuming that individual lives in that area continuously for the entire 70-year time period.

TACs can also cause chronic (long-term) related non-cancer illnesses such as reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system effects, birth defects, or other adverse environmental effects. Risk characterization for non-cancer health hazards from TACs is expressed as a hazard index (HI). The HI is a ratio of the predicted concentration of the project's emissions to a concentration considered acceptable to public health professionals, termed the Reference Exposure Level (REL). The SCAQMD has established the following health risk thresholds.

Project-Specific Health Risk Significance Thresholds

The SCAQMD has established the following project-specific health risk significance thresholds (SCAQMD 2015b):

Maximum Incremental Cancer Risk: >=10 in 1 million.

1.

Hazard Index (project increment) >=1.0.

A significant impact would occur if a project's impacts exceeded any of these thresholds.

Cumulative Health Risk Significance Thresholds

The AQMD has published a report on how to address cumulative impacts from air pollution: White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution (SCAQMD 2003c). In this report the AQMD clearly states (Page D-3):

> …the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or EIR. The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for toxic air contaminant (TAC) emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.
>
> Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

4.2.4 - CO "Hotspot" Thresholds

The largest contributor of CO emissions during project operations is typically from motor vehicles. A CO hotspot represents a condition wherein high concentrations of CO may be produced by motor vehicles accessing a congested traffic intersection under heavy traffic volume conditions. The CO hotspot thresholds are represented by the most restricted state or federal CO ambient air quality standards:

- 1-hour CO standard: 20 ppm; and
- 8-hour CO standard: 9 ppm.

If the CO contributed by the project in combination with CO produced by non-project traffic exceeds the above standards, then the project would have a significant impact.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 5: AIR QUALITY AND HEALTH RISK MODELING PARAMETERS AND ASSUMPTIONS

5.1 - Model Selection

Air pollutant emissions can be estimated by using emission factors and a level of activity. Emission factors represent the emission rate of a pollutant given the activity over time, for example, grams of NO_X per horsepower per hour or grams of NOx per vehicle mile traveled. The ARB has published emission factors for on-road mobile vehicles/trucks in the emission factors (EMFAC) mobile source emissions model, and emission factors for off-road equipment and vehicles in the OFFROAD emissions model. An air emissions model (or calculator) combines the emission factors and the various levels of activity, and outputs the emissions for the various pieces of equipment.

The California Emissions Estimator Model (CalEEMod) version 2013.2.2 was developed in cooperation with the SCAQMD and other air districts throughout the State. CalEEMod is designed as a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas emissions associated with construction and operation from a variety of land uses.

Emission factors are often updated and there is a normal lag time between the development of new emission factors and the integration of the new emissions factors into the appropriate models. The current version of CalEEMod uses OFFROAD2011 and EMFAC2011[8] emission factors.

The models used in this analysis are summarized as follows:

- Construction emissions: CalEEMod, version 2013.2.2.
- Operational regional emissions: CalEEMod, version 2013.2.2 (with EMFAC2011).
- Operational localized emissions: EMFAC2014 and methods described below.
- Operational air quality and health risk impacts: USEPA AERMOD air dispersion model (Version 15181)

5.2 - Construction

5.2.1 - Emission Assumptions

Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and prevailing weather conditions. Construction emissions result from onsite and offsite activities. Onsite emissions principally consist of exhaust emissions from the activity levels of heavy-duty construction equipment, motor vehicle operation, and fugitive dust (mainly PM_{10}) from disturbed soil. Additionally, paving operations and application of architectural coatings would release VOC emissions. Offsite emissions are caused by motor vehicle exhaust from delivery vehicles, worker traffic, and road dust (PM_{10} and $PM_{2.5}$).

[8] Note that the ARB has released an update to the EMFAC2011 model, the EMFAC2014 model; however, the EMFAC2014 model has not yet been integrated into the CalEEMod land use emission model

The construction equipment list is shown in Table 11 and was derived from the default equipment assumptions contained in the CalEEMod model for a warehouse project and construction schedule estimates provided by the applicant. The activity for construction equipment is based on the horsepower and load factors of the equipment. In general, the horsepower is the power of an engine - the greater the horsepower, the greater the power. The load factor is the average power of a given piece of equipment while in operation compared with its maximum rated horsepower. A load factor of 1.0 indicates that a piece of equipment continually operates at its maximum operating capacity. This analysis uses the CalEEMod default load factors for off-road equipment.

For the building construction phase, construction equipment operating hours and numbers represent the average equipment activity over the phase. Most equipment is not expected to operate throughout the entire building construction phase, therefore, activity has been assumed to be evenly distributed over the entire phase in this analysis. Portions of the site would be paved to provide 1,237 total parking spaces. A conceptual construction schedule is provided in Table 10. Table 11 provides a listing of construction equipment based on the default information contained in the CalEEMod for the project land use and development size.

Table 10: Conceptual Construction Schedule

Construction Phase	Start Date	End Date	Duration (days)
Site Preparation	1/2/2016	6/17/2016	120
Mass Grading	6/18/2016	9/16/2016	65
Building Construction	9/17/2016	9/19/2017	262
Tenant Improvements (Architectural Coating)	1/2/2017	6/3/2017	60
Paving	6/1/2017	6/28/2017	20
Source: site preparation schedule provided by the CalEEMod model default estimate; remainder of the schedule based on information provided by the project applicant based on a start year of 2016; see Appendix A			

Table 11: Construction Equipment Assumptions

Activity	Equipment	Number	Hours per day	Horse-power	Load Factor
Site Preparation	Rubber Tired Dozers	3	8	255	0.40
	Tractors/Loaders/Backhoes	4	8	97	0.37
Mass Grading	Excavators	2	8	162	0.38

	Trencher	1	8	80	0.50
	Tractors/Loaders/Backhoes	2	7	97	0.37
	Welders	1	8	46	0.45
Tenant Improvements (Architectural Coatings)	Air Compressors	5	8	78	0.48
Paving	Pavers	2	8	125	0.42
	Paving Equipment	2	8	130	0.36
	Rollers	2	8	80	0.38
Source: see Appendix A, The equipment inventory for site preparation and paving construction activities were taken from the CalEEMod default equipment inventory for these construction activities; the equipment inventory for the grading, building construction, and tenant improvements was derived from information provided by the project applicant; equipment hours, horsepower, and load factors for all equipment were taken from the CalEEMod model					

Equipment Tiers and Emission Factors

Equipment tiers refer to a generation of emission standards established by the US EPA and ARB that apply to diesel engines in off-road equipment. The "tier" of an engine depends on the model year and horsepower rating; generally, the newer a piece of equipment is, the greater the tier it is likely to have. Excluding engines greater than 750 horsepower, Tier 1 engines were manufactured generally between 1996 and 2003. Tier 2 engines were manufactured between 2001 and 2007. Tier 3 engines were manufactured between 2006 and 2011. Tier 4 engines are the newest and some incorporate hybrid electric technology; they were manufactured after 2007 (SCAQMD 2011).

CalEEMod contains an inventory of construction equipment that incorporates estimates of the number of equipment, their age, their horsepower, and equipment tier from which rates of emissions are developed. The CalEEMod default tier mix was used in this analysis for the estimation of emissions from onsite construction equipment for the unmitigated scenario.

CalEEMod's off-road emission factors are based on the equipment populations from the OFFROAD2011 model. For the unmitigated scenario, emission factors for the applicable year of each construction phase were used.

Fugitive Dust

SCAQMD Rule 403 requires fugitive dust generating activities follow best available control measures to reduce emissions of fugitive dust. These measures are accounted for in CalEEMod as "mitigation" because the model categorizes the measures as "mitigation," even though they are technically not

mitigation. The best available control measures and the associated measure in CalEEMod are displayed in Table 12.

Table 12: Best Available Control Measures

Best Available Control Measure[1]	Associated Measure in CalEEMod [2]
Clearing and Grubbing 02-1 Maintain stability of soil through pre-watering of site prior to clearing and grubbing. 02-2 Stabilize soil during clearing and grubbing activities. 02-3 Stabilize soil immediately after clearing and grubbing activities. **Earth Moving Activities** 08-1 Pre-apply water to depth of proposed cuts 08-2 Re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed 100 feet in any direction 08-3 Stabilize soils once earth-moving activities are complete	Water exposed surfaces three times per day Pre-water to 12 percent
Import/Export of Bulk Materials 09-1 Stabilize material while loading to reduce fugitive dust emissions. 09-2 Maintain at least six inches of freeboard on haul vehicles. 09-3 Stabilize material while transporting to reduce fugitive dust emissions. 09-4 Stabilize material while unloading to reduce fugitive dust emissions. 09-5 Comply with Vehicle Code Section 23114.	Water exposed surfaces three times per day
Landscaping 10-1 Stabilize soils, materials, slopes Guidance: Apply water to materials to stabilize; maintain materials in a crusted condition; maintain effective cover over materials; stabilize sloping surfaces using soil until vegetation or ground cover can effectively stabilize the slopes; hydroseed prior to rain season.	Water exposed surfaces three times per day
Staging Areas 13-1 Stabilize staging areas during use by limiting vehicle speeds to 15 miles per hour.	Reduce speed on unpaved roads to 15 miles per hour.
Traffic Areas for Construction Activities 15-1 Stabilize all off-road traffic and parking areas. 15-2 Stabilize all haul routes. 15-3 Direct construction traffic over established haul routes. Guidance: Apply gravel/paving to all haul routes as soon as possible to all future roadway areas; barriers can be used to ensure vehicles are only used on established parking areas/haul routes.	Water exposed surfaces three times per day

[1] SCAQMD Rule 403
[2] Applied in CalEEMod - output in Appendix A

Construction Offsite Trips

CalEEMod default values for worker trip generation, trip length, and vehicle fleet were used in this analysis. Vendor trips were also calculated using CalEEMod default values. The CalEEMod default vehicle type (Heavy Heavy-Duty Truck) was used for haul trips; the soil would be balanced onsite.

A summary of the construction related trips is shown in Table 13. The total number of offsite construction trips would not necessarily occur on the same day since the various construction activities would vary each day.

Table 13: Construction Offsite Trips

Activity	Construction Trips		
	Worker (trips per day)	Vendor (trips per day)	Haul (trips per day)
Site Preparation	18	0	0
Mass Grading	30	0	0
Building Construction	882	344	0
Tenant Improvements	176	0	0
Paving	15	0	0
Source: CalEEMod, Appendix A			

5.2.2 - Localized Analysis Methodology

As noted in Section 4.2.2 above, the assessment of localized air quality impacts during construction employed the SCAQMD's daily emission LST tables based on the location of the project, the construction area where the emissions would be generated, and the distance to the nearest sensitive receptor.

5.3 - Operation

Operational emissions are those emissions that occur during operation of the project. The major sources are summarized below.

5.3.1 - Emission Assumptions – Regional Emissions

Motor Vehicles

Motor vehicle emissions refer to exhaust and road dust emissions from the motor vehicles that would travel to and from the project site. Mobile emissions from passenger vehicles and heavy-duty trucks were modeled separately using different CalEEMod runs since each vehicle class is assumed to have a different trip length. The emissions from both sources were estimated using CalEEMod model for estimating of regional emissions. Daily and peak hour vehicle trips, trip generation rates, and fleet mix assumptions from the project traffic study (Urban Crossroads 2014) were used in this analysis. The total daily trip generation for the project was calculated as 3,126 trips (overall trip rate

of 1.68 trips per thousand square feet of building space), while the total peak hour (PM peak) trips were calculated as 223 trips (overall trip rate of 0.12 trips/thousand square feet of building space).

Motor Vehicles - Passenger Vehicle Fleet

The trip generation rates for passenger vehicles are shown in Table 14. The trip generation rates are from the project specific traffic study (Urban Crossroads 2014). Passenger vehicles comprise 1,935 daily trips, and 149 peak hour trips.

Table 14: Passenger Vehicle Trip Generation Rates

Land Use	Quantity	Units	Daily Trip Generation Rate (trips/unit/day)		
			Weekday	Saturday	Sunday
Warehouse	1,860.76	ksf	1.040	1.040	1.040
Land Use	**Quantity**	**Units**	**Peak Hour Trip Generation Rate (trips/unit/hour)**		
			Weekday	**Saturday**	**Sunday**
Warehouse	1,860.76	Ksf	0.080	0.080	0.080

Notes:
ksf = 1,000 square feet
Saturday and Sunday trip rate assumed to be the same as weekday trip rate.
Source: Urban Crossroads 2014.

The CalEEMod default trip percentages for an unrefrigerated warehouse were used. In addition, the CalEEMod default round trip lengths for an urban setting (SoCAB portion of Riverside County) were used in this analysis of passenger vehicles.

The vehicle fleet mix is defined as the mix of motor vehicle classes active during the operation of the project. Emission factors are assigned to the expected vehicle mix as a function of vehicle class, speed, and fuel use (gasoline and diesel-powered vehicles). The passenger vehicle fleet mix used in this analysis is assumed to include only light duty automobiles, light duty trucks, and medium duty trucks. The passenger vehicle fleet mix is shown in Table 15. The CalEEMod default vehicle fleet was changed based on the data in the traffic study, which indicates that there would be 1,079 LDA, 153 LDT1, 481 LDT2, and 222 MDV daily trips.

Table 15: Passenger Vehicle Fleet Mix

Type of Vehicle	Fleet Mix (%)
Light duty automobile (LDA)	55.8
Light duty truck (LDT1)	7.9
Light duty truck (LDT2)	24.9
Medium duty vehicle (MDV)	11.4
Light-heavy duty truck (LHDT1)	0.0

Table 15 (cont.): Passenger Vehicle Fleet Mix

Type of Vehicle	Fleet Mix (%)
Light-heavy duty truck (LHDT2)	0.0
Medium-heavy duty truck (MHDT)	0.0
Heavy-heavy duty truck (HHDT)	0.0
Other bus (OBUS)	0.0
Urban bus (UBUS)	0.0
Motorcycle (MCY)	0.0
School bus (SBUS)	0.0
Motor home (MH)	0.0
Source of Project Analysis: FirstCarbon Solutions based on the CalEEMod default and the traffic study.	

Motor Vehicles - Heavy Duty Truck Fleet

The trip generation rates for heavy-duty trucks are shown in Table 16. The trip generation rates are from the project specific traffic study (Urban Crossroads 2014). Heavy-duty trucks comprise 38.1 percent of the daily vehicle fleet or 1,191 trips per day, and 33.3 percent of the peak hour (PM) trips or 74 peak hour trips.

Table 16: Heavy Duty Truck Trip Generation Rates

Land Use	Quantity	Units	Daily Trip Generation Rate (trips/unit/day)		
			Weekday	Saturday	Sunday
Warehouse	1,860.76	ksf	0.64	0.64	0.64
Land Use	**Quantity**	**Units**	**Peak Hour Trip Generation Rate (trips/unit/hour)**		
			Weekday	**Saturday**	**Sunday**
Warehouse	1,860.76	ksf	0.04	0.04	0.04
Notes: ksf = 1,000 square feet Saturday and Sunday trip rate assumed to be the same as weekday trip rate. Source: Urban Crossroads 2014.					

The CalEEMod default pass-by rate was used in this analysis. The CalEEMod default trip length values are not appropriate for these types of heavy-duty truck trips associated with warehouse land uses. For unspecified warehouse projects, SCAQMD recommends a default trip length of 40 miles. This trip length was used in the analysis of the heavy-duty truck fleet.

The heavy-duty truck fleet mix used in this analysis is assumed to consist of light heavy-duty trucks (LHDT1, LHDT2), medium heavy-duty trucks (MHDT), and heavy heavy-duty trucks (HHDT). The heavy-duty truck fleet mix is shown in Table 17, and is based on the project traffic study.

Table 17: Heavy Duty Truck Fleet Mix

Type of Vehicle	Project Daily Truck Fleet (%)	Percentage of Peak Hour (PM) Truck Fleet (%)
Light-heavy duty truck (LHDT1)	16.8	16.2
Light-heavy duty truck (LHDT2)	5.2	5.9
Medium-heavy duty truck (MHDT)	17.7	17.7
Heavy-heavy duty truck (HHDT)	60.3	60.2
Source: Urban Crossroads 2014.		

Daily pollutant emissions from the various mobile sources were calculated using information derived from the project description, project traffic study, and mobile source emission factors from the ARB EMFAC2011 mobile source emissions factor model that is embedded in the CalEEMod land use emission model.

Other Emission Sources

Architectural Coatings (Painting)

Paints release VOC emissions. The buildings in the project would be repainted on occasion. CalEEMod defaults were used for this purpose.

Consumer Products

Consumer products are various solvents used in non-industrial applications, which emit VOCs during their product use. "Consumer Product" means a chemically formulated product used by household and institutional consumers including, but not limited to, detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products; but does not include other paint products, furniture coatings, or architectural coatings (ARB 2011c).

The default emission factor developed for CalEEMod of 0.0000198 pounds VOC per day, per square foot is based on a statewide factor and was used for the project.

Landscape Equipment

CalEEMod estimated the landscaping equipment using the default assumptions in the model.

Electricity

There would be emissions from the power plants that would generate electricity to be used by the project (for lighting, etc.). CalEEMod defaults were used to estimate these emissions from the project.

The default CalEEMod emission factors for Southern California Edison (which are from the year 2007) are as follows:

- Carbon dioxide: 630.89 pound per megawatt hour (lb/MWh)
- Methane: 0.029 lb/MWh
- Nitrous oxide: 0.006 lb/MWh

Electricity consumption for the project is shown in Table 18. The CalEEMod default electricity consumption rate was used. This is because the project's anticipated electricity consumption assumes LEED compliance and other energy features.

Table 18: Project Electricity Consumption

Scenario	Electrical Consumption (kWh/sq ft/year)			Total (MWh/year)
	Title 24	Non-Title 24	Lighting	
Default CalEEMod factors for unrefrigerated warehouse	0.45	0.82	Parking: 0.88 Buildings: 1.75	5,860
Project with Reductions: applies LEED and energy efficient features	0.11	0.12	Parking: 1.43 Buildings: 0.39	1,555

Notes:
sq ft = square feet MWh = megawatt hours KWh = kilowatt hours
Source of Project with Reductions: RPM Engineers (2014) Estimated Annual Energy Use, linearly scaled downward from the original project size of 2,560,000 square feet to 1,860,760 square feet
Source of Total: Electrical Consumption multiplied by 1,860,760 square feet of buildings and 275,200 square feet of parking and divided by 1,000

CalEEMod has three categories for electricity consumption: electricity that is impacted by title-24 regulations, non-title-24 electricity, and lighting. The Title 24 uses are defined as the major building envelope systems covered by California's Building Code, Title 24 Part 6, such as space heating, space cooling, water heating, and ventilation. Lighting is separate since it can be both part and not part of Title-24. Since lighting is not considered as part of the building envelope energy budget, CalEEMod does not consider lighting to have any further association with Title 24 references in the program. Non-Title 24 includes everything else such as appliances, break room equipment, computer servers, forklift chargers, and other electronics. Electricity consumption was subdivided into categories based on the estimated electricity consumption report provided by the applicant (RPM Engineers 2014).

Natural Gas

There would be emissions from the combustion of natural gas used for the project (water heaters, heat, etc.). The project's natural gas consumption is shown in Table 19 based on the default values contained in the CalEEMod model.

Table 19: Project Natural Gas Consumption

Land Use	Building Area (sq ft)	Consumption (kBtu/year)	Consumption (kBtu/sq ft/year)
Warehouse	1,876,760	3,982,300	2.14

sq ft = square feet KBtu = one thousand British thermal units
Source: CalEEMod model default estimates

Water and Wastewater

There would be greenhouse gas emissions from the use of electricity to pump water to the project and to treat wastewater. Water usage for the project was estimated based on the water use report from the Yucaipa Valley Water District Water Supply Study (YVWD 2013).

Table 20: Project Water Consumption

Land Use	Building Area (sq ft)	Water Use (million gallons/year)[(1)]		
		Total	Indoor	Outdoor
Warehouse	1,860,760	20.35	11.36	8.99

Note:
(1) The indicated water consumption rates have been linearly scaled downward from the original project size of 2,560,000 square feet to 1,860,760 square feet
sq ft = square feet
Source: Yucaipa Valley Water District Water Supply Study (YVWD 2013).

Solid Waste

Greenhouse gas emissions would be generated from the decomposition of solid waste generated by the project. CalEEMod was used to estimate the greenhouse gas emissions from this source. The CalEEMod default for the mix of landfill types is as follows:

- Landfill no gas capture: 6 percent
- Landfill capture gas flare: 94 percent
- Landfill capture gas energy recovery: 0 percent

The CalEEMod 2013 default waste generation values were used for this analysis. The waste generation rate from the project is shown in Table 21.

Table 21: Waste Generation

Land Use	Size at buildout (sq ft)	Waste at buildout (tons/year)	Disposal Rate (tons/Ksq ft/year)
Warehouse	1,860,760	1,714	0.92

Notes:
sq ft = square feet; Ksq ft = thousand square feet
Source of disposal rate: CalEEMod model default

Vegetation

The project would construct buildings onsite as well as asphalt parking areas, thereby changing the land use and reducing potential carbon sequestration. The project would also plant trees and integrate landscape into the project design, thereby increasing carbon sequestration. These sequestration benefits were not quantified in CalEEMod, as project specific details of vegetation types and quantities were not available.

Other Support Equipment

The operation of the project would also require the use of forklifts and yard trucks to move delivered goods and trailers within the building yards. Information provided by the project applicant indicates that the forklifts and yard trucks would be electrically powered. In addition, the project applicant has indicated that there will be no requirement for standby emergency generators. Therefore, the electricity for the forklifts and yard trucks is included in the greenhouse gas emissions assessment.

5.3.2 - Emission Assumptions – Localized Operational Emissions

The predominant sources of local operational emissions are the motor vehicles and trucks that access the project site. Such emissions result from the delivery truck traffic that arrives, unloads, and departs daily from the project buildings and from the daily worker traffic accessing the project's parking lots. In this assessment, three main emission sources were evaluated as to their localized operational impacts on air quality:

- Delivery truck exhaust emissions from truck traffic that would travel to and within the project site from the entrances along Cherry Valley Boulevard;
- Truck idling emissions at loading docks of the project buildings; and
- Automobile traffic from workers while traveling to and within the project from entrances along Cherry Valley Boulevard.

The estimation of the mobile source emissions requires the specification of several key pieces of information including, the number of vehicle trips by vehicle type, trip travel lengths, vehicle idling time, and emission factors that define the amount of emissions as a function of vehicle speed and distance traveled, or amount of idling time per vehicle.

Daily pollutant emissions from the various mobile sources were calculated using information derived from the project description, project traffic study, and mobile source emission factors from the ARB EMFAC2014 mobile source emissions factor model. Onsite vehicle trip distances were determined from the project's site plan as the distance from the project entrance to the loading docks of the project buildings. Vehicle trips were also defined according to their driveway distribution and trip destinations along Cherry Valley Boulevard, east of the project and west of the project to Interstate 10 as per the project traffic study. The emission factors for the project's mobile source operational emissions were based on the 2017 fleet year, the opening year for the project. Vehicle travel speeds while traveling onsite were assumed to be 15 miles per hour (mph) for both trucks and worker vehicles, while passenger cars were assumed to travel at 35 mph and heavy duty trucks at 25 mph while traveling along Cherry Valley Boulevard. Delivery trucks were assumed to idle for 15 minutes per day at the

building loading dock areas. The inventory of diesel truck trips was presented earlier in Table 16 and Table 17 above. The project was assumed to operate over a 24-hour schedule. Daily pollutant emissions were used to estimate the project's daily and annual impacts. In addition to the estimation of daily emissions, peak hour emissions were also estimated to provide an assessment of impacts for nitrogen dioxide (NO_2)and carbon dioxide (CO), and estimates for the acute non-cancer hazard estimate which are based on 1 hour or 8 hour averaging times.

Emissions from motor vehicles can be characterized as follows:

- Combustion Emissions (grams/mile or grams/hour for idling): Combustion emissions (i.e., exhaust emissions) result from the combustion of fuel and are the main source of emissions for all pollutants. EMFAC has the capability to provide emission rates for user defined vehicle speeds, fuel type, vehicle class, and model year.
- Tire Wear (grams/mile) and Brake Wear (grams/mile): EMFAC has the capability to provide particulate emissions from tires and brakes occurring from operational wear.
- Running Loss (grams/mile): Running loss emissions are defined as evaporative hydrocarbons that are emitted from hoses, fittings or canisters, while the vehicle is in operation. This occurs either because fuel heating has caused the vapor generation rate to exceed the vehicle's capacity to control the vapors, or through permeation and leakage. (Total Organic gas emissions only)

The exhaust emissions for each pollutant are calculated as follows:

$$Emissions_{total} = \sum_{i=1}^{n} \left\{ VMT_i \left[EF_i + RL_i \right] + \left[EF_{idling\text{-}1} \times IdVOL_i \times T_i \right] \right\}$$

Where:

$Emissions_{total}$ = total running exhaust and idling emissions summed over all vehicle classes
EF_i = running exhaust emission factor for each vehicle type at a specific vehicle speed (g/mi)
EF_{idling} = idling emission factor for each vehicle class (g/hour)
VMT_i = total number of vehicle trips by vehicle class
$IdVOL_i$ = number of idling vehicles by vehicle class
RL_i = TOC evaporative running loss for each vehicle class (g/mi)
T_i = idling hours for each vehicle class (hours)
n = number of vehicle classes
$_i$ = vehicle class

Particulate matter emissions result from not only vehicle travel and idling, but also from tire wear and brake wear and from re-entrained road dust from travel on paved roads. The total particulate matter emission factor then includes the following:

$$PM = PM_r + PM_t + PM_b + PM_{erd}$$

Where:

PM = Particulate matter emission factor (g/mi).
PM_r = Running exhaust emission factor (g/mi).
PM_t = Tire wear emission factor (g/mi).
PM_b = Brake wear emission factor (g/mi)
PM_{erd} = Re-entrained road dust emission factor for paved roads (g/mi).

The tire wear and brake wear emission factors are derived from the EMFAC2014 emission model for both PM_{10} and $PM_{2.5}$ emissions.

The relevant expression for estimating road dust emissions on paved roads was taken from the EPA AP-42 emission methodology as follows (EPA 2011):

$$PM_{dust} = EF_{rd} \times VMT$$

Where:

PM_{dust} = Particulate emissions from re-suspended road dust.
VMT = Vehicle miles traveled by all vehicles along the road (mi/day).
EF_{erd} = re-entrained paved road dust emission factor calculated as:

$$EF_{erd} = k \times (sL)^{0.91} \times (W)^{1.02}$$

Where:

k = particle size multiplier for the particulate size of interest (lbs/VMT)
sL = silt loading (g/m^2)
W = average weight of all vehicles along the road (tons)

The emission factors for the various pollutants used in the localized analysis are provided in Appendix B.

5.3.3 - Localized Analysis Methodology (Dispersion Modeling) - Operations

Methodology

The evaluation of localized impacts determines the potential of the project to violate any air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. To evaluate localized impacts for construction, an air dispersion model (EPA model, AERMOD) was used to simulate the movement of project-related pollutants through the air and compare the concentration of those pollutants with the localized significance thresholds.

Terrain elevations were obtained for the project site using AERMAP, the AERMOD terrain data pre-processor. The urban dispersion option was used, utilizing the County of Riverside population provided by the SCAQMD, 2,100,516. The meteorological data for the years 2008 through 2012 is from the SCAQMD Banning Airport. Table 22 summarizes the general AERMOD model assumptions

Table 22: General Modeling Assumptions

Feature	Assumption
Terrain processing	Complex terrain; elevations were obtained for the project site using the EPA AERMAP terrain data pre-processor
Emission source configuration	See Table 23
Regulatory Dispersion Options	Default Assumptions Used
Land Use	Urban; County of Riverside population provided by the SCAQMD (population: 2,100,516)
Coordinate System	Universal Transverse Mercator
Building downwash	Included in calculations; each building was assumed to be 47 feet in height
Meteorological Data	SCAQMD Banning Airport Meteorological Data for 2008-2012
NO_2 Assessment Methodology	Ambient Ratio Method
Receptor height	0 meters, as recommended by SCAQMD LST methodology
Source: FirstCarbon Solutions 2015.	

Emission Source Characterization

Each of the emission source types described above also requires geometrical and emission release specifications for use in the air dispersion model. Table 23 provides a summary of the assumptions used to configure the various emissions. By way of explanation, the following definitions are used in defining the emission source geometrical configurations referred to in Table 23:

- Point source: a single identifiable local source of emissions; it is approximated in the AERMOD air dispersion model as a mathematical point in the modeling region, with a location and emission characteristics such as height of release, temperature, etc. (Example: a stack or vent); and
- Line source: a series of adjacent volume sources along a path (Example: vehicular traffic along a street).

Table 23: Summary of Emission Source Configurations

Emission Source Type	Geometric Configuration	Relevant Assumptions
Onsite Diesel Truck Traffic	Line Sources	• See Table 16 and Table 17 for an inventory of truck operations • Stack release height: 12 feet • Vehicle Speed: 15 mph • Length of the line source (distance from the facility entrances on Cherry Valley Boulevard to the loading docks of the project buildings)

Table 23 (cont.): Summary of Emission Source Configurations

Emission Source Type	Geometric Configuration	Relevant Assumptions
		• Vehicle types: heavy duty diesel delivery trucks • Emission factor: ARB EMFAC 2014 • Operations: 24/7
Onsite Diesel Truck Idling	Point Sources located at each facility	• See Table 17 and Table 18 for an inventory of truck operations • Stack release height: 12 feet • Stack release characteristics > Stack diameter: 0.3 feet > Stack velocity: 170 feet/sec > Stack temperature: 200° F • Idle time: 15 minutes per truck per day • Vehicle type: heavy duty diesel delivery trucks • Emission factor: ARB EMFAC 2014 • Operations: 24/7
Offsite Vehicle Traffic	Line sources	• See Table 17 and Table 18 for an inventory of truck operations • Stack release height: 12 feet • Vehicle speed: 35 mph for passenger cars and 25 mph for heavy duty trucks • Vehicle type: passenger cars and heavy duty trucks • Travel along Cherry Valley Boulevard to and from the project driveways • Operations: 24/7
Source: FirstCarbon Solutions 2015.		

Exhibit 5 provides the location of the various project facilities and emission source locations analyzed in this assessment.

Receptor Network

The assessment also requires that a network of receptors be specified such that the impacts can be computed at the various locations within the network.

Exhibit 6 shows the various receptor locations that included fence line receptors and locations of existing and proposed sensitive receptors. Receptor locations were generally placed at 50-meter intervals south of the project in the residential area of the proposed Sunny Cal Specific Plan and at 100 and 200-meter intervals surrounding the project site.

5.3.4 - Health Risk Assessment Methodology

About Health Risk Assessments

A HRA is a guide that helps to determine if current or future exposures to a chemical or substance could affect the health of a population. The State of California Office of Environmental Health Hazard Assessment (OEHHA) develops methods for conducting HRAs. As defined under the Air Toxics "Hotspots" Information and Assessment Act of 1987 ["AB 2588" (Chapter 1252, Statutes of

1987), California Health and Safety Code Section 44306], "A health risk assessment means a detailed comprehensive analysis prepared pursuant to Section 44361 to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure" (OEHHA 1987).

This HRA builds upon the methodology described above in the localized air quality assessment by examining the project's potential health risk impacts. The HRA methodology applies a risk characterization model to the results from the air dispersion model to estimate potential health risks at each sensitive receptor location. However, unlike the localized assessment, which looks at impacts within a specific year, the HRA examines the impacts over extended exposure time, which in the case of cancer risk is a 70-year lifetime exposure. The methodology applied in calculating cancer risk from TACs has been published by the SCAQMD and the OEHHA. In this regard, cancer risk is expressed as the probability of an individual developing cancer due to exposure to TAC emissions out of a population of 1 million individuals. Thus, a receptor calculated to have a cancer risk of 1 in one million, means that this receptor has a probability of 1 person in 1 million of developing cancer from the continuous exposure to TACs.

The methodology basically assumes that a person is exposed continuously to a project's TAC emissions for a period of 350 days per year, 24 hours per day, over a 70-year lifetime period. The SCAQMD has established a significance threshold of 10 in 1 million for cancer risk attributable to exposure to a project's emissions. Project-related cancer risks at sensitive receptors exceeding this significance threshold are considered by the SCAQMD to result in significant health risk impacts for purposes of CEQA compliance.

Clearly, this methodology provides a very conservative estimate of health risk given that an individual would not typically reside in any one location for a 70-year period, and be continuously exposed over that period, 350 days per year, 24 hour per day. Exposure duration is one factor in determining the estimation of cancer risk. In a recent study prepared by the California Office of Environmental Health Hazard Assessments (OEHHA 2012), OEHHA concluded that from examining US census data from 2006 to 2009, over 90 percent of California householders had lived at their current home address for less than 30 years, and over 63 percent householders had lived at their current residence for 9 years or less.

Other California surveys indicate that during the period 2000-2001, on average, Californians spend approximately 73 percent of their time at home per day. When looking at the data by age group, the time increases to 85 percent for children under 2 years old. Children that are 2 years or older but less than 16 years old spend 72 percent of their time at home; whereas, Californians that are 16 years or older spend 73 percent of their time at home. In addition, all ethnicity groups spend 71 percent to 74 percent of their time at home. The data also demonstrate a trend where the higher the total household income is, the less time the residents spend at their home.

Thus, the cancer risk methodology applied in the HRA will produce conservative estimates of health risks (in terms of over-estimating impacts).

Exposures to TACs such as DPM can also cause chronic (long-term) related non-cancer illnesses such as reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system effects, birth defects, or other adverse environmental effects.

Risk Assessment Methodology

The construction and operation of the project would result in the release of TACs from the operation of diesel-powered equipment and vehicles. Exposures to TACs would have the potential to cause health risks in terms of excess risk of cancer and non-cancer health effects as discussed below.

Toxic Air Contaminants of Concern

The most important TAC emitted by the project with respect to health risk is DPM from off-road construction equipment and from the operation of diesel-fueled vehicles during operations. As stated earlier, between 70 to 80 percent of the estimated airborne cancer risk within the SCAQMD is due to DPM from all sources located within the SoCAB. Other TACs are also associated with the operation of gasoline vehicles and include pollutants such as benzene, 1, 3-butadiene, formaldehyde, acetaldehyde, ethyl benzene, and naphthalene. The most relevant health effects of DPM were discussed in Table 4 above.

Cancer Health Risk Assessment Methodology

The cancer risk from DPM is calculated by multiplying an average DPM concentration calculated using the AERMOD air dispersion model, and an inhalation exposure factor as in Equation 1 below (OEHHA 2003).

Cancer Risk = Inhalation cancer potency factor (CPF) x Dose-inhalation (EQ-1)

Where:

Cancer Risk = Total individual lifetime excess cancer risk defined as the cancer risk a hypothetical individual faces if exposed to carcinogenic emissions from a particular facility; this risk is defined as an excess risk because it is above and beyond the background cancer risk to the population contributed by emission sources not related to the project; cancer risk is expressed in terms of risk per million exposed individuals.

Inhalation cancer potency factor (CPF) = 1.1 (milligrams per kilogram per day)$^{-1}$ for DPM;

$$\text{Dose-inhalation} = C_{air} \times (\text{DBR} \times \text{EF} \times \text{ED} \times 10^{-6} / \text{AT}) \times 10^{6} \quad \text{(EQ-2)}$$

Where:

C_{air} is the average DPM concentrations calculated from the AERMOD model in $\mu g/m^3$.
DBR is the average daily breathing rate (L/kg of body weight - day)
EF is the exposure frequency (days per year)
ED is the exposure duration (years)
AT is the time period over which the exposure is calculated (days).

The values listed in the cancer risk equations are shown in Table 24.

Table 24: Inhalation Exposure Factor Values for Sensitive Receptors

Receptor	CPF - diesel PM (mg/kg-dy)-1	DBR (liters/kg-day)	EF (days/yr)	ED (yrs)	AT (days)
Sensitive/Residential	1.1	302	350	70	25,550

Notes:
CPF = cancer potency factor diesel PM = diesel particulate matter DBR = daily breathing rate
EF = exposure frequency ED = exposure duration
AT = average time period over which the exposure is averaged.
Source: OEHHA 2003.

Applying the cancer risk equations with the values for the various factors shown in Table 24, the Cancer Risk for DPM is then calculated as:

$$\text{Sensitive/Residential Cancer Risk}_{\text{diesel PM}} = C_{\text{diesel PM}} \times 318.5 \qquad \text{(EQ-3)}$$

Where:

Cancer $\text{Risk}_{\text{diesel PM}}$ = lifetime 70-year cancer risk from DPM emissions (risk/million)
$C_{\text{diesel PM}}$ = average DPM concentration from the AERMOD model in $\mu g/m^3$ over the lifetime 70-year exposure period

Non-Cancer Health Risk Characterization

Chronic Non-Cancer Impacts

Exposures to TACs such as DPM can also cause chronic (long-term) related non-cancer illnesses such as reproductive effects, respiratory effects, eye sensitivity, immune effects, kidney effects, blood effects, central nervous system effects, birth defects, or other adverse environmental effects. Risk characterization for non-cancer health risks from DPM is expressed as a HI. The HI is a ratio of the predicted concentration of a project's emissions to a concentration considered acceptable to public health professionals, termed the REL. A significant risk is defined by the SCAQMD as an HI of 1 or greater. When evaluating chronic non-cancer effects due to TAC exposures, a hazard quotient (HQ) is established for each individual TAC as follows and for each target organ[9] affected by the individual TAC:

$$HQ_i = C_{air}/REL_i \qquad \text{(EQ-4)}$$

Where:

HQ_i = chronic hazard quotient for each TAC
C_{air} = Annual average concentration of each TAC ($\mu g/m^3$)
REL = Chronic Reference Exposure Level ($\mu g/m^3$)

[9] A target organ is a biological organ(s) most adversely affected by exposure to a chemical substance and includes the respiratory system, cardiovascular system, eyes, nervous system, hematological system, immune system, reproductive system, developmental system, skin, and endocrine system

To evaluate the potential for adverse non-cancer health effects from simultaneous exposure to multiple TACs, the HQs for all TACs that affect the same target organ are summed yielding a HI as follows:

$$HI_{to} = \sum_{tO} HQ_{tac} \qquad \text{(EQ-5)}$$

Where:

HI_{to} = sum of the hazard quotients for all TACs affecting the same target organ
HQ_{tac} = hazard quotient for TAC and target organ.

Chronic health effects were calculated based on annual average DPM concentrations from the operation of the project, since DPM is the most important TAC considered in this assessment. The California OEHHA has assigned a chronic non-cancer REL of 5 μg/m^3 for DPM (OEHHA 2012) for DPM. DPM has effects on the respiratory system, which accounts for essentially all of the potential chronic non-cancer hazards from DPM. Therefore, the only HI calculated was for the respiratory system.

Acute Non-Cancer Impacts

Exposures to toxics air contaminants can also have short-term or acute non-cancer effects, typically dealing with exposures over an hour or so. The California OEHHA has not defined a reference exposure level for DPM appropriate for estimating acute non-cancer hazards from DPM. Therefore, to estimate the potential acute non-cancer impacts from the project operation, it was necessary to examine the various individual chemical components (or chemical species) that comprise the emissions from the diesel and gasoline motor vehicles. For this purpose, use was made of emission source chemical speciation profiles for TOG that provide estimates of the various chemical components that comprise the exhaust from diesel and gasoline vehicles. From this information, an estimate can be made of the maximum one-hour average concentration levels of the project's various chemical species from which an acute non-cancer hazard index can be determined.

Estimation of DPM Emissions

In accordance with accepted SCAQMD methodology, the emission factors for DPM (as PM_{10} exhaust) emissions were averaged over the time period of 2017 to 2086 to correspond to the 70-year exposure time period assumed in the estimation of lifetime cancer risks. This was accomplished by extracting the DPM emission factors for each year from 2017 to 2050 for each vehicle class, and speed from the EMFAC2014 mobile source emission model. The EMFAC2014 emission model does not provide emission factors beyond the year 2050; therefore, the emission factors beyond the year 2050 were set at their year 2050 values. An average DPM emission rate was then calculated as the average value of the emission factors calculated for the years 2017 to 2086. The relevant emission factors are provided in Appendix D.

5.3.5 - Supplemental Health Risk Assessment

Subsequent to the preparation of the health risk assessment contained within Section 5.3.3 above, a significant update in methodology and guidance for estimating cancer risks was published in March 2015 by the California Office of Environmental Health Hazards Assessment (OEHHA). The new OEHHA guidance uses more recent scientific findings to include children's greater sensitivities and

susceptibilities to exposures to toxic air contaminants. In general, residential cancer risks from pollutants like diesel particulate matter are found to be higher with the application of the new OEHHA guidance than the cancer risks estimated using the methodology currently summarized in Table 24 above as currently recommended by the SCAQMD which does not take into account child sensitivity and susceptibility. This supplemental assessment of cancer risk applies the new OEHHA guidance in updating the cancer risk estimates from the project.

Currently, the SCAQMD has not officially adopted the new OEHHA cancer risk guidance for evaluating cancer risks for purposes of CEQA assessments. However, while this supplemental assessment is not required under CEQA by the SCAQMD, it is presented below in anticipation of the guidance being adopted by the SCAQMD for CEQA evaluations in the near future.

Estimation of Motor Vehicle DPM Emissions with EMFAC2014

The project was assumed to commence operation in 2017. The emission factors for DPM (as PM_{10} exhaust) emissions were estimated for the years 2017, 2018, 2019, 2020, 2025, 2030, 2035, 2040, and 2045. This was done to account for the future reduction in DPM emissions forecasted by the new EMFAC2014 model from motor vehicles, particularly heavy duty trucks as motor vehicles meet the mandated state mobile vehicle emission regulations.

Estimation of Construction DPM Emissions

Construction DPM emissions (as PM_{10} exhaust) were estimated using the CalEEMod land use emission model as previously described in Section 5.2 above. Construction was assumed to commence in 2016 and continue into 2017.

Cancer Risk Methodology – New OEHHA Guidance

The new cancer risk guidance published by the OEHHA contains a set of assumptions for estimating cancer risks that incorporate early-in-life cancer risk adjustment factors that account for increased sensitivity and susceptibility of infants and young children to exposures to carcinogens. These adjustment factors include age-sensitivity weighting factors, age-specific daily breathing rates, and age-specific time-at-home factors. The formulation of cancer risk is similar to the formulation shown in Equation 2 above with the addition of the age adjustment factors (AAF) shown in Equation 6 below.

$$\text{Inhalation Exposure Factor} = CPF \times EF \times ED \times AAF/AT \quad \text{(EQ-6)}$$

Where:

CPF = Inhalation cancer potency factor for the TAC $(mg/kg\text{-}day)^{-1}$
EF = Exposure frequency (days/year)
ED = Exposure duration (years)
AT = Averaging time period over which exposure is averaged (days)
AAF = set of age-specific adjustment factors that include age sensitivity factors (ASF), daily breathing rates (DBR), and time at home factors (TAH)

The OEHHA recommended values for the various cancer risk parameters shown in Equation 6 are shown in Table 25. Note that even though the SCAQMD has not officially adopted the new OEHHA

guidance for CEQA evaluations, the SCAQMD provides recommended values for the various cancer risk parameters that are shown in Table 25.

Table 25: Exposure Assumptions for Cancer Risk – New OEHHA Guidance

Receptor Type	Exposure Frequency		Exposure Duration (years)	Age Sensitivity Factors (ASF)	Time at Home Factor (TAH)[1] (%)	Daily Breathing Rate[2] (DBR) (L/kg-day)
	Hours/ day	Days/year				
Sensitive/Residential						
3rd Trimester	24	350	0.25	10	100	361
0-2 years	24	350	2	10	100	1,090
3-15 years	24	350	14	3	100	572
16 to 30 years	24	350	14	1	73	261

Notes:
(1) Time at Home (TAH) factors recommended by the SCAQMD
(2) The daily breathing rates recommended by the SCAQMD are the 95th percentile rate for sensitive/residential receptors 0 to 2 years and 80th percentile breathing rates for ages 3 years and older
(L/kg-day) = liters per kilogram body weight per day
Source of Current OEHHA Guidance: OEHHA 2015 and SCAQMD 2015; see Appendix E

Annual average DPM air quality impacts were calculated at each receptor location for each year commencing with the construction in 2016 out to the year 2045, the 30-year exposure duration called for in the new OEHHA guidance for sensitive receptors. Specifically, construction annual DPM impacts were estimated for the years 2016 and 2017. Annual average operational impacts were estimated for the years 2017, 2018, 2019, 2020, 2025, 2030, 2035, 2040, and 2045. Operational DPM impacts were then interpolated between these years to provide annual DPM impacts for all years from 2016 to 2045. Note, the project's operational impacts during 2016 were set to zero. During 2017 when both construction and operations would occur simultaneously, the annual DPM impacts from construction were added to the annual DPM impacts from operations to provide a total impact assessment due to all sources of DPM emissions from the project. Equation 6 was then employed to estimate the cancer risk for each year during the 30-year exposure duration of 2016 to 2045. The 30-year exposure duration cancer risk was then estimated as the sum of the cancer risks for each individual year.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 6: AIR QUALITY IMPACT ANALYSIS

This section calculates the estimated emissions from construction and operation of the project and compares the resulting air quality impacts to the relevant CEQA and SCAQMD significance thresholds.

6.1 - Impact Analysis

6.1.1 - Consistency with Air Quality Management Plan

Impact AQ-1:	**The project would conflict with or obstruct implementation of the applicable air quality plan.**

Impact Analysis

According to the 1993 SCAQMD Handbook, there are two key indicators of consistency with the AQMP:

1. Indicator: Whether the project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP. Project applicability: applicable and assessed below.
2. Indicator: A project would conflict with the AQMP if it will exceed the assumptions in the AQMP in 2010 or increments based on the year of project build-out and phase. The Handbook indicates that key assumptions to use in this analysis are population number and location and a regional housing needs assessment. The parcel-based land use and growth assumptions and inputs used in the Regional Transportation Model run by the SCAG that generated the mobile inventory used by the SCAQMD for AQMP are not available. Therefore, this indicator is not applied for the evaluation of the project.

In addition to indicator 1 above, consistency with the AQMP will also be determined based on whether the project complies with applicable control measures, rules, and regulations, as discussed below.

Project's Contribution to Air Quality Violations

According to the SCAQMD, the project is consistent with the AQMP if the project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP (SCAQMD 1993, page 12-3).

If a project's emissions exceed the SCAQMD regional thresholds for NO_X, ROG, PM_{10}, or $PM_{2.5}$, it follows that the emissions could cumulatively contribute to an exceedance of a pollutant for which the SoCAB is in nonattainment (ozone, nitrogen dioxide, PM_{10}, $PM_{2.5}$) at a monitoring station in the SoCAB. An exceedance of a nonattainment pollutant at a monitoring station would not be consistent with the goals of the AQMP - to achieve attainment of pollutants.

As noted in the discussion of Impact AIR-3 below, the regional significance analysis of construction emissions demonstrated that without mitigation, emissions of ROG would exceed the SCAQMD regional significance thresholds. The regional significance analysis of operational impacts indicates that without mitigation, the project would violate the SCAQMD regional significance thresholds for ROG and NO_X.

Consistency with Current General Plans

The development of emission burdens used in air quality management plans to demonstrate compliance with ambient air quality standards is based, in part, on land use patterns contained within local general plans. Therefore, it is reasonable to conclude that if a project is consistent with the applicable general plan land use designation, and if the general plan was adopted prior to the applicable air quality management plan, then the growth of vehicle miles traveled (VMT) and/or population generated by said project would be consistent with the growth in VMT and population assumed within the air quality management plan. The current General Plan land use for the project site is Very Low Density Residential (VLDR) within the County, and Residential Low (RL) with the City of Calimesa. The project would result in the construction and operation of warehouses uses and would generate a higher growth in VMT than anticipated under the General Plan. Therefore, growth supported by development of the project would not be accounted for in the air quality management plan. The project is potentially significant under this criterion.

Control Measures

This step involves assessing the project's compliance with the control measures in the AQMPs.

2003 AQMP. The 2003 AQMP contains a number of land use and transportation control measures including the following: the District's Stationary and Mobile Source Control Measures; State Control Measures proposed by ARB; and Transportation Control Measures provided by SCAG. ARB's strategy for reducing mobile source emissions include the following approaches: new engine standards; reduce emissions from in-use fleet, require clean fuels, support alternative fuels and reduce petroleum dependency, work with EPA to reduce emissions from national and state sources, and pursue long-term advanced technology measures (SCAQMD 2003, page 4-25). Transportation control measures provided by SCAG include those contained in the Regional Transportation Plans, the most current version of which is the 2012 Regional Transportation Plan. The Regional Transportation Plan has control measures to reduce emissions from on-road sources by incorporating strategies such as high occupancy vehicle interventions, transit, and information-based technology interventions (SCAQMD 2003, page 4-19). The project indirectly would comply with the control measures set by ARB and SCAG.

2007 AQMP. The focus of the 2007 AQMP is to demonstrate attainment of the federal $PM_{2.5}$ ambient air quality standard by 2015 and the federal 8-hour ozone standard by 2024, while making expeditious progress toward attainment of state standards. This is to be accomplished by building upon improvements from the previous plans and incorporating all feasible control measures while balancing costs and socioeconomic impacts. The 2007 AQMP indicates that $PM_{2.5}$ is formed mainly by secondary reactions or sources. Therefore, instead of reducing fugitive dust, the strategy for

reducing $PM_{2.5}$ focuses on reducing precursor emissions of SO_X, directly emitted $PM_{2.5}$, NO_X, and ROG.

The Final 2007 AQMP control measures consist of four components. The first component is SCAQMD's Stationary and Mobile Source Control Measures. The Final 2007 AQMP includes 30 short-term and mid-term stationary and seven mobile source control measures for SCAQMD implementation. A complete listing of the measures is in the 2007 AQMP and includes measures such as VOC reductions from gasoline transfer and dispensing facilities, further NO_X reductions from space heaters, localized control program for PM emission hot spots, urban heat island, energy efficiency and conservation, etc. Some of the measures will become new rules and some will be amendments to existing rules. When the rules pass, the owner-operator will follow the applicable rules.

The second component is ARB's Proposed State Strategy, which includes short- and mid-term control measures aimed at reducing emissions from sources that are primarily under state jurisdiction, including on-road and off-road mobile sources, and consumer products. These measures are required in order to achieve the remaining emission reductions necessary for $PM_{2.5}$ attainment. ARB's strategy includes measures such as improvements to California's Smog Check Program, expanded passenger vehicle retirement, cleaner in-use heavy-duty trucks, reductions from port related sources, cleaner off-road equipment, evaporative and exhaust strategies, pesticide strategies, etc. When these measures are implemented by the ARB, the project would be required to follow them.

The third component is SCAQMD Staff's Proposed Policy Options to Supplement ARB's Control Strategy. SCAQMD staff believes that a combination of regulatory actions and public funding is the most effective means of achieving emission reductions. As such, the 2007 Final AQMP proposes three policy options for the decision makers to consider in achieving additional reductions. The first option is to incorporate the SCAQMD proposed additional control measures as a menu of selections further reducing emissions from sources primarily under state and national jurisdiction. The second option is to have the State fulfill its NO_x emission reduction obligations under the 2003 AQMP by 2010, for its short-term defined control measures plus additional reductions needed to meet the NO_X emission target between 2010 and 2014. The third option is based on the same rate of progress under Policy Option 1, but it relies heavily on public funding assistance to achieve the needed NO_X reductions via accelerated fleet turnover, to post-2010 on-road emission standards or the cleanest off-road engine standards in effect today or after 2010. This strategy does not apply to the project.

The fourth component consists of Regional Transportation Strategy and Control Measures provided by SCAG. Transportation plans within the SoCAB are statutorily required to conform to air quality plans in the region, as established by the 1990 Federal Clean Air Act and reinforced by other Acts. The region must demonstrate that its transportation plans and programs conform to the mandate to meet the federal ambient air quality standards in a timely manner. The Regional Transportation Plan, prepared by the SCAG, is developed every 4 years with a 20-year planning horizon to meet the long-term transportation planning requirements for emission reductions from on-road mobile sources within the SoCAB. The biennial Regional Transportation Improvement Program requires that the short-term implementation requirements of the Transportation Conformity Rule be met by SCAG. The first 2 years of the program are fiscally constrained and demonstrate timely

implementation of a special category of transportation projects called Transportation Control Measures. In general, Transportation Control Measures are those projects that provide emission reductions from on-road mobile sources, based on changes in the patterns and modes by which the regional transportation system is used. Strategies are grouped into three categories: high occupancy vehicle strategy, transit and systems management, and information-based technology (traveling during a less congested time of day). SCAG approved the transportation measures in the Regional Transportation Plan, which have been included in the region's air quality plans. The Transportation Control Measures will be implemented and will subsequently reduce emissions in the SoCAB.

2012 AQMP. The 2012 AQMP was adopted December 7, 2012. The purpose of the 2012 AQMP for the SoCAB is to set forth a comprehensive and integrated program that will lead the SoCAB into compliance with the federal 24-hour $PM_{2.5}$ air quality standards, and to provide an update of the SoCAB's projections in meeting the federal 8-hour ozone standards. Similarly to the prior AQMPs, the project would comply with all applicable rules and regulations enacted as part of the AQMP. In addition, as discussed in the Regulatory section, the AQMP relies upon the SCAG regional transportation strategy, which is in its adopted 2012-2035 RTP/SCS and 2011 Federal Transportation Improvement Program. Included in the RTP/SCS are regional transportation strategy and transportation control measures including the following: active transportation (non-motorized transportation - biking and walking); transportation demand management; transportation system management; transit; passenger and high-speed rail; goods movement; aviation and airport ground access; highways; arterials; and operations and maintenance.

SIPs. Geographical areas in the state that exceed the federal air quality standards are called nonattainment areas. The project area is in nonattainment for ozone, PM_{10}, $PM_{2.5}$, and nitrogen dioxide. SIPs show how each area will attain the federal standards. To do this, the SIPs identify the amount of pollutant emissions that must be reduced in each area to meet the standard and the emission controls needed to reduce the necessary emissions. On September 27, 2007, ARB adopted its State Strategy for the 2007 SIP. In 2009, the SIP was revised to account for emissions reductions from regulations adopted in 2007 and 2008 and clarifies ARB's legal commitment. There are currently proposed revisions and a 2011 Progress Report. The South Coast is currently 94 percent of the way towards achieving the 2014 emissions levels identified in its $PM_{2.5}$ SIP. The SIP takes into account ARB rules and regulations. The project will comply with applicable rules and regulations.

Summary

In summary, the project would comply with all applicable rules and regulations. However, the project could impede attainment because its emissions exceed the SCAQMD regional significance thresholds.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Implement Mitigation Measures AQ-1 to AQ-8.

Level of Significance After Mitigation

Significant and unavoidable impact. The project would comply with all applicable rules and regulations. However, the project could impede attainment because its emissions exceed the SCAQMD regional significance thresholds for ROG during construction and NOx and ROG during operations even after mitigation.

Potential for Air Quality Standard Violation

Impact AQ-2: **The project would not violate any air quality standard or contribute substantially to an existing or projected air quality violation.**

Impact Analysis

Two criteria are used to assess the significance of this impact: (1) the localized construction and operational significance analysis and (2) the CO hot spot analysis.

Localized Construction Analysis

The SCAQMD Governing Board adopted a methodology for calculating localized air quality impacts through localized significance thresholds (also referred to as a LST analysis). Localized significance thresholds represent the maximum emissions from a project that would not cause or contribute to an exceedance of the most stringent applicable state or federal ambient air quality standards. Localized significance thresholds were developed in recognition of the fact that criteria pollutants such as CO, NO_X, and PM_{10} and $PM_{2.5}$ in particular, can have local impacts at nearby sensitive receptors as well as regional impacts. The localized significance thresholds are developed for each source receptor area and are applicable to emissions of NO_X, CO, PM_{10}, and $PM_{2.5}$.

The localized assessment methodology limits the emissions in the analysis to those generated from onsite activities. The onsite emissions during construction are compared with the localized significance thresholds and are summarized in Table 26. As shown in Table 26, unmitigated emissions during construction do not exceed the SCAQMD localized construction significance thresholds.

Table 26: Localized Significance Analysis (Construction)

Activity	Onsite Emissions (pounds per day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Site Preparation	54.6	41.1	10.0	6.6
Mass Grading	89.3	56.4	6.6	4.1
Building Construction	28.6	17.9	2.0	1.8
Tenant Improvements	14.6	12.5	1.2	1.2
Paving	20.3	14.7	1.1	1.0
Maximum Daily Emissions[1]	**89.3**	**56.4**	**10.0**	**6.6**
Localized Significance Threshold	236	2,817	21	11
Exceed Threshold?	No	No	No	No

Table 26 (cont.): Localized Significance Analysis (Construction)

Activity	Onsite Emissions (pounds per day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Notes: [1] The maximum daily emissions refer to the maximum emissions that would occur in one day; it was assumed that the site preparation and grading activities do not occur at the same time as the other construction activities; therefore, their emissions are not summed; the maximum daily emissions would occur during grading activities for NOx and CO and during the site preparation activity for particulate matter. Source of emissions: Appendix A Source of thresholds: South Coast Air Quality Management District 2009, for Source Receptor Area 29, at a distance of 25 meters and an area disturbed of 5 acres per day.				

Localized Operational Analysis

The localized impacts during project operations are summarized in Table 27. As shown in this table, the operation of the project would not exceed any SCAQMD operational localized significance threshold.

Table 27: Localized Significance Analysis (Operations)

Air Pollutant	Averaging Time, Units	Local Project Impact	Back-ground Air Quality	Total	Standard/ Threshold	Significant Impact?
Carbon monoxide (CO)	1-hour, ppm	0.03	2.29	2.32	20	No
	8-hour, ppm	0.02	1.60	1.62	9.0	No
Nitrogen dioxide (NO_2)	1-hour, ppm	0.016	0.072	0.088	0.18	No
	1-hour 98th percentile, ppm	0.012	0.050	0.062	0.100	No
	Annual, ppm	0.001	0.010	0.011	0.03	No
Particulate matter (PM_{10})	24-hour, $\mu g/m^3$	1.4	NA	1.4	2.5	No
	Annual, $\mu g/m^3$	0.6	NA	0.6	1.0	No
Particulate matter ($PM_{2.5}$)	24-hour, $\mu g/m^3$	0.4	NA	0.4	2.5	No

Notes:
Concentration units for each air pollutant are shown in the second column; the AERMOD model estimates pollutant concentrations in units of micrograms per cubic meter; to estimate pollutant concentrations for NO2 and CO which are in units of parts per million by volume, the NO2 pollutant concentrations in micrograms per cubic meter are divided by 1,880 and the CO pollutant concentrations are divided by 1,100; these multiplication factors are based on a standard temperature of 25 degrees centigrade and a standard atmospheric pressure of 760 millibars

NA=Not Applicable; as noted above, since the SCAQMD exceeds the federal or State PM_{10} and $PM_{2.5}$ standards, determining background levels of PM_{10} and $PM_{2.5}$ are unnecessary (SCAQMD 2008); the PM_{10} and $PM_{2.5}$ significance thresholds are based on the requirements of SCAQMD Rule 403 – Fugitive Dust from construction and SCAQMD Rule 1303

Table 27 (cont.): Localized Significance Analysis (Operations)

Air Pollutant	Averaging Time, Units	Local Project Impact	Back-ground Air Quality	Total	Standard/ Threshold	Significant Impact?
- Requirements ppm = parts per million (a unit of concentration); µg/m^3 = micrograms per cubic meter (a unit of concentration) Sources: - Local project impacts are from project specific dispersion modeling; model output is in Appendix B, Localized Criteria Pollutant Assessment. - Background air quality for CO and NO_2 from Table 1 of this AQ-GHG report. - Total = local project impact + background air quality - Standard/threshold: see Table 10 of this AQ-GHG report. Source: Appendix B.						

Carbon Monoxide Hot Spot Analysis

CO "hot spot" thresholds ensure that emissions of CO associated with traffic impacts from a project, in combination with CO emissions from existing and forecasted regional traffic, do not exceed state or federal standards for CO at any traffic intersection impacted by the project. Project concentrations may be considered significant if a CO hot spot intersection analysis determines that project generated CO concentrations cause a localized violation of the state CO 1-hour standard of 20 ppm, state CO 8-hour standard of 9 ppm, federal CO 1-hour standard of 35 ppm, or federal CO 8-hour standard of 9 ppm.

A CO hot spot is a localized concentration of CO that is above the state or federal 1-hour or 8-hour CO ambient air standards. Localized high levels of CO are associated with traffic congestion and idling or slow-moving vehicles. To provide a worst-case scenario, CO concentrations are estimated at project-impacted intersections, where the concentrations would be the greatest.

This analysis follows guidelines recommended by the CO Protocol (University of California, Davis 1997) and the SCAQMD. According to the CO Protocol, intersections with Level of Service (LOS) E or F require detailed analysis. In addition, intersections that operate under LOS D conditions in areas that experience meteorological conditions favorable to CO accumulation require a detailed analysis. The SCAQMD recommends that a local CO hot spot analysis be conducted if the intersection meets one of the following criteria: 1) the intersection is at LOS D or worse and where the project increases the volume to capacity ratio by 2 percent, or 2) the project decreases LOS at an intersection from C to D.

The Traffic Study prepared for this project by Urban Crossroads analyzed four project scenarios: Existing Plus Project (2014), Existing Plus Ambient Growth Plus Project (2017), Existing Plus Ambient Growth Plus Project Plus Cumulative (2017), and Horizon Year Plus Project (2035). The Existing Plus Project and Existing Plus Ambient Growth Plus Project scenarios resulted in two intersections operating at LOS below D, while the Existing Plus Ambient Growth Plus Project Plus Cumulative scenario resulted in three intersections operating at LOS below D. The Horizon Year Plus Project scenario resulted in six intersections operating at LOS below D.

Using the CALINE4 model, potential CO hot spots were analyzed at the intersections listed in Table 28. Two intersections from each analysis year (2014, 2017, and 2035) were chosen to investigate potential near-term and long-term impacts. These intersections were chosen because they operate at LOS D or worse and had the highest traffic volumes for the given scenario year. There are several inputs to the CALINE4 model. One input is the traffic volumes, which are from the project-specific traffic report. Emission factors were generated using the EMFAC2011 model for the applicable scenario year.

As shown in Table 28, the estimated 1-hour and 8-hour average CO concentrations at build-out in combination with background concentrations are below the state and federal standards. No CO hot spots are anticipated because of traffic-generated emissions by the project in combination with other anticipated development in the area. Therefore, the mobile emissions of CO from the project are not anticipated to contribute substantially to an existing or projected air quality violation of CO. Therefore, according to this criterion, air pollutant emissions during operation would result in a less than significant impact.

Table 28: Localized Carbon Monoxide Concentrations

Scenario	Intersection	Peak Hour	Estimated CO Concentration (ppm)				Significant Impact?
			1 Hour Impact[1]	Significance Threshold	8 Hour Impact[2]	Significance Threshold	
Existing Plus Project (2014)	1. I-10 EB Ramps and Cherry Valley Blvd.	PM	3.0	20.0	1.9	9.0	No
Existing Plus Project (2014)	2. I-10 WB Ramps and Cherry Valley Blvd.	AM	3.0	20.0	1.9	9.0	No
Existing Plus Ambient Growth Plus Project Plus Cumulative (2017)	1. I-10 EB Ramps and Cherry Valley Blvd.	PM	3.0	20.0	1.9	9.0	No
Existing Plus Ambient Growth Plus Project Plus Cumulative (2017)	2. I-10 WB Ramps and Cherry Valley Blvd.	AM	3.0	20.0	1.9	9.0	No
Horizon Year Plus Project (2035)	1. I-10 EB Ramps and Cherry Valley Blvd.	PM	2.9	20.0	1.8	9.0	No

Table 28 (cont.): Localized Carbon Monoxide Concentrations

Scenario	Intersection	Peak Hour	Estimated CO Concentration (ppm)				Significant Impact?
			1 Hour Impact[(1)]	Significance Threshold	8 Hour Impact[(2)]	Significance Threshold	
Horizon Year Plus Project (2035)	2. I-10 WB Ramps and Cherry Valley Blvd.	PM	2.6	20.0	1.8	9.0	No

Notes:
(1) The 1-hour concentration is the CALINE4 project increment (see Appendix D for model output) plus the 1-hour background concentration of 2.3 ppm (from Table 1). 1-hour background calculated by dividing 8-hour background CO by 0.7 (persistence factor).
(2) The 8-hour concentration is the CALINE4 project increment (see Appendix D) multiplied by 0.7 (persistence factor to convert the 1-hour average CALINE4 model output to an 8-hour average), then adding the 8 hour background concentration of 1.6 ppm (from Table 1).
Source: see Appendix D.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

None required.

Level of Significance After Mitigation

Less than significant impact.

Cumulative Impacts

Impact AQ-3: **The project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).**

Impact Analysis

To result in a less than significant impact, the following criteria must be true:

1. Regional analysis: emissions of nonattainment pollutants must be below the regional significance thresholds. This is an approach recommended by the SCAQMD in its comment letters.
2. Summary of projections: the project must be consistent with current air quality attainment plans including control measures and regulations. This is an approach consistent with Section 15130(b) of the CEQA guidelines.
3. Cumulative health impacts: the project must result in less than significant cumulative health effects from the nonattainment pollutants. This approach correlates the significance of the

regional analysis with health effects, consistent with the court decision, *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1219-20.

Regional Analysis

If an area is in nonattainment for a criteria pollutant, then the background concentration of that pollutant has historically exceeded the ambient air quality standard. It follows that if a project exceeds the regional threshold for that nonattainment pollutant, then it would result in a cumulatively considerable net increase of that pollutant and result in a significant cumulative impact.

The SoCAB is in nonattainment for PM_{10}, $PM_{2.5}$, nitrogen dioxide, and ozone. Therefore, if the project exceeds the regional thresholds for PM_{10}, or $PM_{2.5}$, then it would contribute to a cumulatively considerable impact for those pollutants. If the project exceeds the regional threshold for NO_X or VOC (ozone precursors), then it follows that the project would contribute to a cumulatively considerable impact for ozone. If the project exceeds the NO_X threshold, it could contribute cumulatively to nitrogen dioxide concentrations.

Regional emissions include those generated from all onsite and offsite activities. Regional significance thresholds have been established by the SCAQMD because emissions from projects in the SoCAB can potentially contribute to the existing emission burden and possibly affect the attainment and maintenance of ambient air quality standards. Projects within the SoCAB region with emissions in excess of any of the thresholds presented in Table 6 for construction and operations are considered to make a cumulatively considerable contribution to that exceedance.

Construction Emissions

Table 29 summarizes construction-related emissions (without mitigation). For the assumptions used in generating the emissions, please refer to Section 4 of this report. The information shown in Table 29 indicates that without mitigation, the project's short-term construction emissions would exceed the SCAQMD regional threshold for ROG.

Table 29: Unmitigated Regional Construction Air Pollutant Emissions

Source	Emissions (pounds per day)					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Site Preparation	5.2	54.7	42.3	0.0	10.1	6.7
Mass Grading	7.6	89.5	58.3	0.1	6.9	4.2
Building Construction	9.9	63.1	109.4	0.2	14.6	5.5

Plan Approach

Section 15130(b) of the CEQA Guidelines states the following:

> The following elements are necessary to an adequate discussion of significant cumulative impacts: 1) Either: (A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or (B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact.

In accordance with CEQA Guidelines 15130(b), this analysis of cumulative impacts is based on a summary of projections analysis. This analysis considers the current CEQA Guidelines, which includes the recent amendments approved by the Natural Resources Agency and effective on March 18, 2010. This analysis is based on the 2003 and 2007 AQMPs. The SoCAB is in nonattainment for ozone, particulate matter (PM_{10} and $PM_{2.5}$), and nitrogen dioxide, which means that concentrations of those pollutants currently exceed the ambient air quality standards for those pollutants. When concentrations of ozone, PM_{10}, $PM_{2.5}$, and nitrogen dioxide exceed the ambient air quality standard, then those sensitive to air pollution (i.e., children, elderly, sick) could experience health effects, such as decrease of pulmonary function and localized lung edema in humans and animals, increased mortality risk, and risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures, and pulmonary function decrements in chronically exposed humans.

Under the amended CEQA Guidelines, cumulative impacts may be analyzed using other plans that evaluate relevant cumulative effects. The AQMPs describe and evaluate the future projected emissions sources in the SoCAB, and sets forth a strategy to meet both state and federal Clean Air Act planning requirements and federal ambient air quality standards. Therefore, the AQMPs are relevant plans for a CEQA cumulative impacts analysis. The 2003 AQMP updates the attainment demonstration for the federal standards for ozone and PM_{10}; replaces the 1997 attainment demonstration for the federal CO standard and provides a basis for a maintenance plan for CO for the future; and updates the maintenance plan for the federal nitrogen dioxide standard that the SoCAB has met since 1992. The 2007 AQMP focuses on ozone and $PM_{2.5}$. The AQMP also incorporates significant new scientific data, emission inventories, ambient measurements, control strategies, and air quality modeling.

The geographic scope for cumulative criteria pollution from air quality impacts is the SoCAB, because that is the area in which the air pollutants generated by the sources within the SoCAB circulate and are often trapped. The SCAQMD is required to prepare and maintain an AQMP and a SIP to document the strategies and measures to be undertaken to reach attainment of ambient air quality standards. While the SCAQMD does not have direct authority over land use decisions, it is recognized that changes in land use and circulation planning are necessary to maintain clean air. The SCAQMD evaluated the entire SoCAB when it developed the AQMP.

In accordance with CEQA Guidelines section 15064, subdivision (h)(3), a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project complies with the requirements in a previously approved plan or mitigation program. As identified in Impact AQ-1, the project complies with the control measures in the 2003 and the 2007 AQMP and all of the SCAQMD's applicable rules and regulations. However, because the project exceeds the SCAQMD's CEQA significance thresholds, the analysis contained in Impact AQ-1 demonstrates that the project is not consistent with the most recent AQMP and SIP without mitigation. Therefore, the project presents a significant impact according to this criterion.

Cumulative Health Impacts

The SoCAB is in nonattainment for ozone, nitrogen dioxide, PM_{10}, and $PM_{2.5}$, which means that the background levels of those pollutants are at times higher than the ambient air quality standards. The air quality standards were set to protect public health, including the health of sensitive individuals (such as the elderly, children, and the sick). Therefore, when the concentration of those pollutants exceeds the standard, it is likely that some sensitive individuals in the population would experience health effects that were described in Table 4. However, the health effects are a factor of the dose-response curve. Concentration of the pollutant in the air (dose), the length of time exposed, and the response of the individual are factors involved in the severity and nature of health impacts. If a significant health impact results from project emissions, it does not mean that 100 percent of the population would experience health effects.

The regional analysis indicates that without mitigation, the project would exceed the SCAQMD regional significance thresholds for VOC and NO_x (ozone precursors). Because ozone is a secondary pollutant (it is not emitted directly but formed by chemical reactions in the air), it can be formed miles downwind of the project site. Project emissions of VOC and NO_x may contribute to the

background concentration of ozone and cumulatively cause health effects. Impacts may include the following: irrigation to respiratory system; reduce lung function; breathing pattern changes; reduction of breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; increased mortality risk; and vegetation and property damage. Children who live in high ozone communities and who participate in multiple sports have been observed to have a higher asthma risk. This is a significant cumulative health impact associated with ground-level ozone concentrations.

Additionally, the project could result in a significance cumulative contribution to PM_{10}. Sensitive individuals may experience health impacts when concentrations of this pollutant exceeds the ambient air quality standards. Health impacts from particulate matter may include the following:

Short-term exposure (hours/days): irrigation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; those with heart disease can suffer heart attacks and arrhythmias.

The project could result in a significant impact to nitrogen dioxide. The potential effects from nitrogen dioxide may include the following:

- Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups;
- Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; and/or
- Contribution to atmospheric discoloration.

As shown by the CO hotspot analysis in Impact AQ-2, the project, in combination with CO emissions from other regional emission sources, would not result in an exceedance of the CO ambient air quality standard at project-impacted intersections. The standards are set to protect the health of sensitive individuals. Therefore, the project would not result in cumulative health effects from CO exposure.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Implement Mitigation Measures AQ-1 to AQ-8.

The mitigated construction emissions are shown in Table 32. After mitigation, the construction activities would not exceed any daily threshold, and construction emissions would be less than significant.

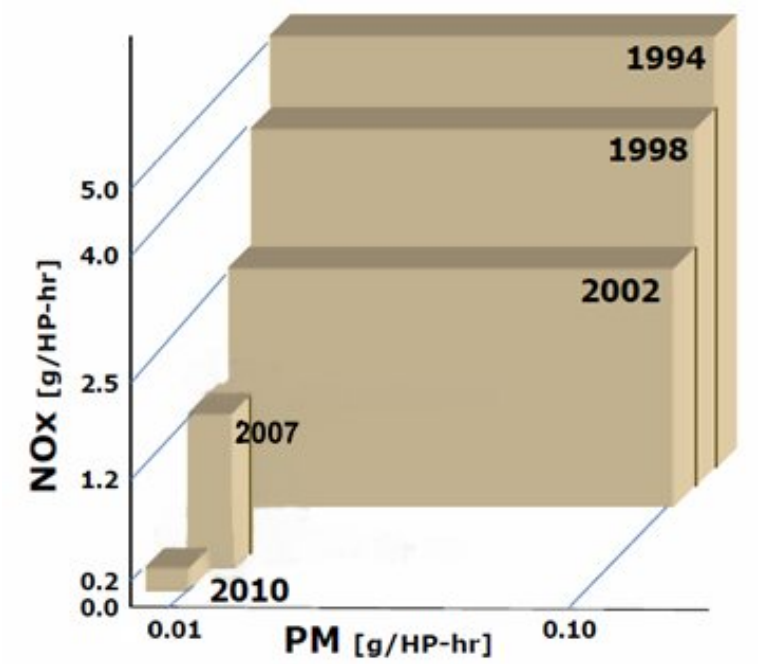
Table 32: Mitigated Regional Construction Air Pollutant Emissions

Source	Emissions (pounds per day)					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Site Preparation	1.1	19.6	24.6	0.0	8.2	4.9
Mass Grading	2.1	40.6	49.3	0.1	4.6	2.1
Building Construction	7.6	48.3	109.2	0.2	13.5	4.6
Tennant Improvements	60.5	9.8	22.5	0.0	2.6	1.1
Paving	2.1	11.2	17.8	0.0	0.8	0.6
Maximum Daily Emissions[(1)]	**70.2**	**69.3**	**148.4**	**0.2**	**16.9**	**6.3**
Significance Threshold	75	100	550	150	150	55
Significant Impact?	No	No	No	No	No	No

Notes:
[(1)] The maximum daily emissions refer to the maximum emissions that would occur in one day; it was assumed that the site preparation and grading are independent activities that do not occur at the same time as the other construction activities; therefore, their emissions are not summed; the maximum daily emissions would occur during the overlapping of the building construction, tenant improvements, and paving construction activities for all pollutants.
ROG = reactive organic gases NO_X = nitrogen oxides CO = carbon monoxide
SO_X = sulfur oxides PM_{10} and $PM_{2.5}$ = particulate matter
Source of emissions: Appendix A: CalEEMod Output
Source of thresholds: South Coast Air Quality Management District 2011a.

Mitigation Measure AQ-7(c) requires that the heavy-duty diesel trucks accessing the project site have engines made in ~~2007~~ 2010 or newer. These engines have stricter emissions standards for NOx and PM. The figure below demonstrates the historical changes in U.S. heavy duty diesel emission standards for NOx and PM. As shown below, the model year ~~2007~~ 2010 standards are only a fraction of the older standards, at 0.2 grams per horsepower hour (g/HP-hr) of NOx and 0.01 g/HP-hr of PM. To estimate the reduction in emissions from this mitigation, the emission factors in CalEEMod were changed toreflect model year 2010 emission factors for the running exhaust emissions, which assumes that the operational heavy-heavy duty diesel trucks accessing the project site are model year 2010 or newer.

Figure 4: Historic Emission Standards for Nitrogen Oxide and Particulate Matter



Mitigated maximum daily operational emissions are shown in Table 33 for the summer and Table 34 for the winter. As shown, the project's mitigated operational emissions would continue to exceed the SCAQMD's regional thresholds for ROG and NOx in both season scenarios; therefore, these impacts are significant and unavoidable.

Table 33: Mitigated Regional Operational Emissions - Summer

Source	Emissions (pounds per day)					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$

Level of Significance After Mitigation

Significant and unavoidable impact.

Sensitive Receptors

Impact AQ-4: The project would not expose sensitive receptors to substantial pollutant concentrations.

Sensitive Receptors

Those individuals who are sensitive to air pollution include children, the elderly, and persons with preexisting respiratory or cardiovascular illness. For purposes of CEQA, the SCAQMD considers a sensitive receptor to be a location where a sensitive individual could remain for 24 hours, such as residences, hospitals, or convalescent facilities (SCAQMD 2008a). Commercial and industrial facilities are not included in the definition because employees do not typically remain onsite for 24 hours. However, when assessing the impact of pollutants with 1-hour or 8-hour standards (such as nitrogen dioxide and carbon monoxide), commercial and/or industrial facilities would be considered sensitive receptors for those purposes.

The closest sensitive receptors are existing residences located to the east of the project along Cherry Valley Boulevard and proposed residential developments (i.e., Sunny Cal Specific Plan) located across Cherry Valley Boulevard, approximately 50 meters south of the project.

Localized Significance Threshold Analysis

The localized construction analysis uses thresholds that represent the maximum emissions for a project that would not cause or contribute to an exceedance of the most stringent applicable federal

or state ambient air quality standard (SCAQMD 2008a). The thresholds are developed based on the ambient concentrations of that pollutant for each source receptor area and on the location of the sensitive receptors. If the project results in emissions under those thresholds, it follows that the project would not cause or contribute to an exceedance of the standard. The standards are set to protect the health of sensitive individuals. If the standards are not exceeded at the sensitive receptor locations, it follows that the receptors would not be exposed to substantial pollutant concentrations.

As identified in Impact AQ-2, the localized construction analysis demonstrated that the project would not exceed the localized thresholds for CO, nitrogen dioxide, PM_{10}, or $PM_{2.5}$. Therefore, during construction, the project would not expose sensitive receptors to substantial pollutant concentrations of CO, nitrogen dioxide, PM_{10}, or $PM_{2.5}$. Further, as identified in Impact AQ-2, the operation of the project would not exceed either of the SCAQMD's operational localized significance thresholds for CO, nitrogen dioxide, PM_{10}, or $PM_{2.5,}$ or create a localized CO hotspot. If the relevant significance thresholds were not exceeded, then the sensitive individuals would not be significantly impacted. Therefore, according to this criterion, air pollutant emissions during operation would result in a less than significant impact.

Toxic Air Pollutants – Project Construction

The construction equipment would emit DPM, which is a carcinogen. However, the DPM emissions are short-term in nature. Determination of risk from DPM is considered over a 70-year exposure time. Guidance published by the California Air Pollution Control Officers Association (CAPCOA 2009), Health Risk Assessments for Proposed Land Use Projects, does not include guidance for health risks from construction projects addressed in CEQA; risks near construction projects are expected to be included later when the toxic emissions from construction activities are better understood. Therefore, considering the short time frame for construction, exposure to DPM during construction is anticipated to be less than significant.

Toxic Air Pollutants –Project Operation

The ARB Air Quality and Land Use Handbook contains recommendations that will "help keep California's children and other vulnerable populations out of harm's way with respect to nearby sources of air pollution" (ARB 2005), including recommendations for distances between sensitive receptors and certain land uses. The Handbook states that its recommendations are advisory and should not be interpreted as "buffer zones." The ARB recognizes the opportunity for more detailed site-specific analyses and there is no "one size fits all" solution to land use planning. The Handbook recommends avoiding siting new sensitive land uses within 1,000 feet of a distribution center. The nearest existing sensitive receptor is over 2,000 feet northwest of the project site, while the nearest planned sensitive receptor is approximately 164 feet (50 meters) from the project site. Therefore, since the project involves the construction of a warehouse approximately 164 feet (50 meters) from the nearest sensitive receptor, a more detailed site-specific Health Risk Assessment has been prepared. The Health Risk Assessment quantifies the cancer risk from project operational toxic air pollutant emissions, primarily from delivery truck exhaust from traffic and truck idling emissions at loading docks.

CVAR_08749

The results of the Health Risk Assessment for cancer risks are provided in Table 35. These results reflect emissions from onsite vehicle travel and idling, as well as traveling along Cherry Valley Boulevard to and from the project. As noted from this table, the operation of the project would not exceed the SCAQMD's cancer risk significance threshold of 10 in one million at any of the locations identified in the analysis. The maximum cancer risk is 6 in a million and is near the project's future driveway #1 at Cherry Valley Boulevard. The maximum chronic and acute non-cancer hazard indices from the operation of the project are estimate to be less than 0.1, values less than the SCAQMD's significance threshold of 1.0. Therefore, cancer risks are less than significant.

Table 35: Estimates of Lifetime Cancer Risk from Project Operations

Location	Cancer Risk (per million)		Exceeds Significance Threshold?
	Maximum Lifetime Project Risk	Significance Threshold	
36240 Cherry Valley Boulevard	0.2	10	No
37101 Cherry Valley Boulevard	0.2	10	No
37251 Cherry Valley Boulevard	0.2	10	No
37255 Cherry Valley Boulevard	0.1	10	No
37275 Cherry Valley Boulevard	0.1	10	No
37303 Cherry Valley Boulevard	0.1	10	No
37321 Cherry Valley Boulevard	0.1	10	No
9865 Roberts Street	0.1	10	No
9975 Roberts Street	0.1	10	No
Sunny Cal Specific Plan (Cherry Valley Boulevard)	1.2	10	No
Holbert Ranch	0.1	10	No
Tournament Hills Elementary School	0.0	10	No
Brookside Elementary School	0.0	10	No
Beaumont High School	0.0	10	No
Bornstein Property	0.3	10	No
Sunset Ranch	0.3	10	No
Note: the maximum cancer risk at any receptor location regardless of whether the location is an existing residence, or zoned for residential, or zoned for non-residential is 6.0 in one million; the location of this maximum risk is near future project driveway 1 and Cherry Valley Boulevard. Source: See Appendix C.			

Toxics Air Pollutants – Cumulative

The SCAQMD has not defined a cumulative significance threshold for toxic air contaminants; however, it assumes that a project that does not exceed the project-level significance threshold

would also not result in a cumulatively significant impact. Considering that, this assessment of the project's cumulative impacts uses the following two-step methodology to determine significance:

- Step One: quantify the sum of the existing risk in the project area, probable new projects within a ¼ mile radius from the project, and the project's impacts. The sum is compared with the 10 in a million threshold. If the cumulative total impacts are below this threshold, a finding of non-significance can be made. If the total impacts exceed the threshold, then they are potentially significant and step two comes into play.
- Step Two: If the project's cancer risk is less than the 10 in a million threshold, then impacts are less than significant.

Step One

Existing Contribution to Cumulative Health Impacts

The South Coast Air Quality Management District (SCAQMD) has conducted an analysis of the cumulative effects of toxic air contaminants (TACs) within the South Coast Air Basin (Basin) as part of its *Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-IV,* the latest version of this MATES study series*)*. The MATES studies express cumulative TAC impacts in terms of potential increased cancer risks. The MATES-IV study estimates that the Basin-wide average excess cancer risk level resulting from exposure to cumulative TACs is approximately 367 incidents per one million population. The MATES-IV Study estimates the cumulative TAC-source cancer risk for the localized area encompassing the Project site at 157 in one million. Diesel Particulate Matter (DPM)-source cancer risks, are reflected in the area's ambient cumulative cancer risk along with all other TAC-source risks, and accounts for the predominance (68%) of the total risk shown in MATES-IV. The cancer risk of 157 in a million constitutes the existing impact from TAC emission sources in the region without the impacts from the project.

Related Projects Contribution to Cumulative Health Impacts

In addition to the MATES-IV cumulative TAC-source cancer risk noted above, other new or proposed potential TAC-generating projects (related projects) in the project area not included in the MATES IV study could contribute to cumulative TAC impacts. These related projects, due to their recent and/or tentative nature, are not reflected in the cumulative TAC impacts identified in the MATES-IV study.

Based on a review of the cumulative development project listing contained in the project traffic study (Urban Crossroads 2014), four projects were identified within the 0.25-mile radius from the project. These development projects are all single-family residential projects and include the following:

- Holbert Ranch – 131 dwelling units
- Bornstein Property – 209 dwelling units
- Sunny Cal Specific Plan – 497 dwelling units
- Sunset Ranch (Osborne/Dunham) – 231 dwelling units

Since these projects are residential, they are not expected to generate TAC emissions that could impact nearby health risk levels.

Project Contribution to Cumulative Health Impacts

Project-level TACs would incrementally increase the background cancer risk by a maximum of 1.2 incidents per million population.

Summary of the Total Cumulative Cancer Risk for Step One

The total cumulative cancer risk under Step One of the cumulative assessment is 158 in a million (157 in a million from existing sources and 1 in a million from the project). In light of the fact that the existing plus planned project impacts already exceeds the 10 in a million cumulative significance threshold by a large margin, a potentially significant cumulative impact exists without the project. Therefore, a second step is required to determine whether the project makes a cumulatively considerable contribution.

Step Two

Identification of a specific amount of risk that constitutes a cumulatively considerable contribution to an existing cumulative impact is necessary in order to avoid a potential conflict with CEQA provisions, which state that any increase within an already-impacted area is not necessarily significant (i.e., "one additional molecule" is not the appropriate standard). According to current SCAQMD recommendations, a project contribution of 10 in one million or more would be considered a cumulatively considerable contribution to the significant cumulative impact. Since the project's maximum cancer risk (1.2 in a million) does not exceed the 10 in one million threshold, the project's health risk impacts are determined to be less than significant on a project-level and would not be considerably significant on a cumulative-level basis.

Supplemental Cancer Risk Assessment

Table 36 summarizes the cancer risks from the construction and operation of the project based on the application of the new CARB and OEHHA guidance and methodologies at various locations surrounding the Project. The estimated risks shown include the mitigation measures identified in the Section 1.5 Mitigation Measures Applied to the Project including Tier III off-road construction equipment and MY2010 heavy-heavy diesel duty trucks. As noted in the table, the cancer risks are generally higher under the new model/guidance compared to the values shown in Table 35 which relies on the older version of the EMFAC mobile source emission model and the current SCAQMD guidance on estimating cancer risks. Nonetheless, the cancer risk levels at all locations after application of the new guidance and methodologies remain below the SCAQMD cancer risk significance threshold of 10 in one million.

Table 36: Estimates of Lifetime Cancer Risks Using the New SCAQMD/OEHHA Guidance and Methodologies

Location	Cancer Risk (New Emission Model/Cancer Risk Guidance WITH MITGATION (per million))		Exceeds Significance Threshold?
	Maximum Lifetime Project Risk	Significance Threshold

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

None required.

Level of Significance After Mitigation

Less than significant impact.

Objectionable Odors

Impact AQ-5: The project would not create objectionable odors affecting a substantial number of people.

Background Information

Odors can cause a variety of responses. The impact of an odor results from interacting factors, such as frequency (how often), intensity (strength), duration (in time), offensiveness (unpleasantness), location, and sensory perception.

Odor is typically a warning system that prevents animals and humans from consuming spoiled food or toxic materials. Odor-related symptoms reported in a number of studies include nervousness, headache, sleeplessness, fatigue, dizziness, nausea, loss of appetite, stomach ache, sinus congestion, eye irritation, nose irritation, runny nose, sore throat, cough, and asthma exacerbation (SCAQMD 2007b).

The SCAQMD's role is to protect the public's health from air pollution by overseeing and enforcing regulations (SCAQMD 2007b). The SCAQMD's resolution activity for odor compliance is mandated under California Health & Safety Code Section 41700, and falls under SCAQMD Rule 402. This rule on Public Nuisance Regulation states: "A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. The provisions of this rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals."

The SCAQMD indicates that the number of overall complaints has declined over the last five years. Over the last four years, odor complaints make up 50 to 55 percent of the total nuisance complaints. Over the past decade, odors from paint and coating operations have decreased from 27 to 7 percent and odors from refuse collection stations have increased from 9 to 34 percent (SCAQMD 2007b).

Impact Analysis

The SCAQMD recommends that odor impacts be addressed in a qualitative manner. Such an analysis shall determine whether the project would result in excessive nuisance odors, as defined under the California Code of Regulations and Section 41700 of the California Health and Safety Code, and thus would constitute a public nuisance related to air quality.

Land uses typically considered associated with odors include wastewater treatment facilities, waste-disposal facilities, or agricultural operations. The project does not contain land uses typically associated with emitting objectionable odors. The project would involve the use of diesel construction equipment and diesel trucks during construction. Emissions from these diesel sources would rapidly disperse in the atmosphere and not be noticeable to the nearby public.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

None required.

Level of Significance After Mitigation

Less than significant impact.

SECTION 7: GREENHOUSE GAS IMPACT ANALYSIS

7.1 - CEQA Guidelines

CEQA Guidelines define a significant effect on the environment as "a substantial, or potentially substantial, adverse change in the environment." To determine if a project would have a significant impact on greenhouse gases, the type, level, and impact of emissions generated by the project must be evaluated.

The following greenhouse gas significance thresholds are contained in Appendix G of the CEQA Guidelines, which were amendments adopted into the Guidelines on March 18, 2010, pursuant to SB 97. A significant impact would occur if the project would:

(a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or

(b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

The evaluation of an impact under CEQA requires measuring data from a project against both existing conditions and a "threshold of significance." With regard to establishing a significance threshold, the Office of Planning and Research's amendments to the CEQA Guidelines Section 15064.7(c) state that "[w]hen adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence."

CEQA Guidelines Section 15064.4(a) further states, " . . . A lead agency shall have discretion to determine, in the context of a particular project, whether to: (1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use . . . ; or (2) Rely on a qualitative analysis or performance based standards."

CEQA Guidelines Section 15064.4 provides that a lead agency may take into account the following three considerations in assessing the significance of impacts from greenhouse gas emissions:

- **Consideration #1**: The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.
- **Consideration #2**: Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- **Consideration #3**: The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such regulations or requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the

possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

7.1.1 - Biological Diversity v. California Department of Fish and Wildlife ("Newhall Ranch")

On November 30, 2015, the California Supreme Court in *Center for Biological Diversity v. California Department of Fish and Wildlife* ("*Newhall Ranch*") invalidated the GHG analysis for a large master planned residential development in Los Angeles County consisting of over 20,000 residential dwelling units and other uses, determining that the GHG significance finding was "not supported by a reasoned explanation based on substantial evidence." In particular, the Court upheld: (1) use of the statewide emissions reduction goal in AB 32 as a significance criterion (pp. 15-19), (2) use of the Scoping Plan's BAU model "as a comparative tool for evaluating efficiency and conservation efforts" of the Project (pp. 18-19), and (3) a comparison of the project's expected emissions to a BAU model rather than a baseline of pre-project conditions (pp.15-19).

Notwithstanding, however, the Court invalidated the GHG analysis on the grounds that the "administrative record discloses no substantial evidence that the Newhall Ranch's project-level reduction of 31 percent in comparison to [BAU] is consistent with achieving AB 32's statewide goal of a 29 percent reduction from [BAU] … ." (p.19, original italics; see also p. 23 ("Nor is Justice Corrigan correct that our analysis 'assumes project-level reduction in greenhouse gas emissions must be greater than the reduction California is seeking to achieve statewide.' [internal citations omitted] . . . [W]e only hold that DFW erred in failing to substantiate its assumption that the Scoping Plan's statewide measure of emissions reduction can also serve as the criterion for an individual land use project.")

In so doing, the Court in *Newhall Ranch* questioned whether "a greater degree of reduction may be needed" from new versus existing development to achieve the statewide goal set forth in AB 32. (p. 20.) The Court also stated that the EIR failed to contain sufficient evidence to conclude that the "land use density" assumptions used in the EIR's GHG emissions model relate to the land use density assumptions used in the Scoping Plan's BAU model. (p. 21-22.) Because this information was not contained in the *Newhall Ranch* EIR, the Court determined that the record in *Newhall Ranch* did not contain substantial evidence supporting the BAU threshold.

The Court in *Newhall Ranch* outlined "potential pathways to compliance" that future EIRs could use to determine if GHG emissions from a given project are significant. Specifically, the Court advised that:

- **Substantiation of Project Reductions from BAU**. A lead agency may use a BAU comparison based on the Scoping Plan's methodology if it also substantiates the reduction a particular project must achieve to comply with statewide goals. The Court suggested a lead agency could examine the "data behind the Scoping Plan's business-as-usual model" to determine the necessary project-level reductions from new land use development at the proposed location. (p. 25.)

- **Compliance with Regulatory Programs or Performance Based Standards**. A lead agency "might assess consistency with AB 32's goal in whole or part by looking to compliance with regulatory programs designed to reduce greenhouse gas emissions from particular activities. (See Final Statement of Reasons, supra, at p. 64 [greenhouse gas emissions 'may be best analyzed and mitigated at a programmatic level.'].) To the extent a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by the Air Resources Board or other state agencies, a lead agency could appropriately rely on their use as showing compliance with 'performance based standards' adopted to fulfill 'a statewide . . . plan for the reduction or mitigation of greenhouse gas emissions.' (CEQA Guidelines § 15064.4(a)(2), (b)(3); see also id., § 15064(h)(3) [determination that impact is not cumulatively considerable may rest on compliance with previously adopted plans or regulations, including 'plans or regulations for the reduction of greenhouse gas emissions'].) (p. 25.)
- **Compliance with GHG Reduction Plans or Climate Action Plans (CAPs)**. A lead agency may utilize "geographically specific GHG emission reduction plans" such as climate action plans or greenhouse gas emission reduction plans to provide a basis for the tiering or streamlining of project-level CEQA analysis. (p. 26.)
- **Compliance with Local Air District Thresholds**. A lead agency may rely on "existing numerical thresholds of significance for greenhouse gas emissions" adopted by, for example, local air districts. (p. 27.)

Therefore, consistent with CEQA Guidelines Appendix G, the three factors identified in CEQA Guidelines Section 15064.4 and the *Newhall Ranch* opinion, the following thresholds are considered in determining the significance of impacts from GHG.

- ***Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emission of GHGs (see Impact GHG-1).***
  Analysis under Impact GHG-1 involves a quantitative analysis of the Project's compliance with the County of Riverside's Climate Action Plan ("CAP"). The CAP is a geographically specific plan that was adopted by the County of Riverside for the purpose of reducing GHG emissions under the control or influence of the County consistent with AB 32 and subsequent state legislation and state agency action to address climate change. This threshold is also consistent with the SCAQMD's draft interim threshold Tier 2, which consists of determining whether a project is consistent with a qualified greenhouse gas reduction plan.
- ***Would the project conflict with the ARB Scoping Plan and regulations adopted for the purpose of reducing emissions of greenhouse gases (See Impact GHG-2)?***
  Analysis under Impact GHG-2 involves a qualitative analysis of the Project's consistency with the ARB's Scoping Plan and with GHG emission reducing regulations. The Scoping Plan (and its adopted regulations) are considered a statewide plan, policy, or regulation adopted by a public agency to reduce GHG emissions that may be used to assess consistency with AB 32.

The County has further determined that each one of the above-two thresholds is considered to be a separate and independent basis upon which to substantiate the significance of the project's GHG impact.

7.1.2 - Methodology

FirstCarbon Solutions (FCS) used CalEEMod Version 2013.2.2 to quantify emissions associated with the construction and operation of the proposed project. This assessment was conducted within the context of the California Environmental Quality Act (CEQA, California Public Resources Code Sections 21000, et seq.). The methodology follows South Coast Air Quality Management District (SCAQMD) recommendations for quantification of emissions and evaluation of potential greenhouse gas impacts. Supporting information is provided in Appendix F.

Existing Emissions

The project site is currently vacant. Therefore, for the purposes of this analysis, existing GHG emissions at the project site are assumed to be zero, and all activities related to the project are considered potential increases in GHG emissions.

Greenhouse Gas Emissions Quantification

GHG emissions per unit of activity, also referred to as emission factors, are incorporated in CalEEMod for each analysis year. Project-related greenhouse gas emissions are quantified based on the Project's buildout year of 2017.

7.1.3 - Construction Emissions

The project would emit GHGs from upstream emission sources and direct sources from construction activities (combustion of fuels from worker vehicles and construction equipment).

An upstream emission source (also known as life cycle emissions) refers to emissions that were generated during the manufacture of products to be used for construction of the project. Upstream emission sources for the project include but are not limited to the following: emissions from the manufacture of cement; emissions from the manufacture of steel; and/or emissions from the transportation of building materials to the seller. The upstream emissions were not estimated because they are expressly not within the purview of EIRs per CEQA Guidelines Section 15144. Additionally, the California Air Pollution Control Officers Association White Paper on CEQA and Climate Change states "The full life-cycle of GHG [greenhouse gas] emissions from construction activities is not accounted for . . . and the information needed to characterize [life-cycle emissions] would be speculative at the CEQA analysis level" (CAPCOA 2008). Therefore, pursuant to CEQA Guidelines Sections 15144 and 15145, upstream /life cycle emissions are speculative; no further discussion is provided.

Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and prevailing weather conditions. Construction emissions result from on-site and off-site activities. On-site emissions principally consist of exhaust emissions (CO_2, CH_4, and N_2O) from heavy-duty construction equipment and motor vehicle operation. Off-site emissions are caused by motor vehicle exhaust (CO_2, CH_4, and N_2O) from delivery vehicles and worker traffic.

The project would emit greenhouse gases from upstream emission sources and direct sources (combustion of fuels from worker vehicles and construction equipment). Greenhouse gas emissions

from project construction equipment and worker vehicles are based on CalEEMod default values. The emissions are from all phases of construction. The emissions analysis assumed full buildout of the project in 2017. The construction schedule utilized in the analysis, represents a "worst-case" analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent.[10] In order to provide a conservative analysis, the short-term construction emissions have been amortized over the expected (long-term) operational life of the project and are included in the quantification of operational emissions. The operational life of a conventional commercial/industrial building is estimated to be 30 years per SCAQMD guidance.

GHG emissions from project construction equipment and worker vehicles are shown in Table 37. The emissions are from all phases of construction.

Table 37: Construction Greenhouse Gas Emissions

Phase	Total $MTCO_2e$ per year
2016	1,180.13
2017	1,870.48
Total	*3,050.61*
Amortized over 30 years	**102**
Notes: Total $MTCO_2e$ may be different from CalEEMod output due to rounding. $MTCO_2e$ = metric tons of carbon dioxide equivalents Source: GHG Modeling Results (Appendix F).	

7.1.4 - Operational GHG Emissions

Operational or long-term emissions occur over the life of the project. Sources of operational emissions include:

- **Area**. Refers to consumer products, area architectural coatings, and landscaping equipment. Area emissions were estimated using CalEEMod.
- **Indirect Electricity**. Refers to the GHG emissions generated by off-site power plants to supply electricity required for the project. Electricity emissions were estimated using CalEEMod.
- Mobile. Refers to motor vehicle/exhaust emissions from the employee and customer vehicles and heavy-duty trucks that would access the project site. Motor vehicle and truck emissions were calculated using CalEEMod and information contained in the project's traffic impact study.

[10] As shown in the California Emissions Estimator Model (CalEEMod) User's Guide Version 2013.2, Table 3.4 "OFFROAD Equipment Emission Factors" as the analysis year increases, emission factors for the same equipment pieces decrease due to the natural turnover of older equipment being replaced by newer less polluting equipment and new regulatory requirements.

- **Natural Gas**. Refers to exhaust from natural gas usage. Carbon dioxide emissions were estimated using CalEEMod.
- **Water.** Estimates the land uses contribution of greenhouse gas emissions associated with supplying and treating the water and wastewater. Water emissions were estimated using CalEEMod.
- **Waste**. Refers to the greenhouse gas emissions associated with disposal of solid waste into landfills. Waste emissions were estimated using CalEEMod.

Proposed Project Emissions

This analysis is restricted to greenhouse gases identified by AB 32, which include carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. The project would generate a variety of greenhouse gases during construction and operation, including several defined by AB 32 such as carbon dioxide, methane, and nitrous oxide.

The project may also emit greenhouse gases that are not defined by AB 32. For example, the project may generate aerosols. Aerosols are short-lived particles, as they remain in the atmosphere for about one week. Black carbon is a component of aerosol. Studies have indicated that black carbon has a high global warming potential; however, the Intergovernmental Panel on Climate Change states that it has a low level of scientific certainty. Water vapor could be emitted from evaporated water used for landscaping, but this is not a significant impact because water vapor concentrations in the upper atmosphere are primarily due to climate feedbacks rather than emissions from project-related activities. The project would emit nitrogen oxides and volatile organic compounds, which are ozone precursors. Ozone is a greenhouse gas; however, unlike the other greenhouse gases, ozone in the troposphere is relatively short-lived and can be reduced in the troposphere on a daily basis. Stratospheric ozone can be reduced through reactions with other pollutants.

Certain greenhouse gases defined by AB 32 would not be emitted by the project. Perfluorocarbons and sulfur hexafluoride are typically used in industrial applications, none of which would be used by the project. Therefore, it is not anticipated that the project would emit perfluorocarbons or sulfur hexafluoride.

An upstream emission source (also known as life cycle emissions) refers to emissions that were generated during the manufacture of products to be used for construction of the project. Upstream emission sources for the project include but are not limited emissions from the manufacture of cement, emissions from the manufacture of steel, and/or emissions from the transportation of building materials to the seller. The upstream emissions were not estimated because they are not within the control of the project and to do so would be speculative. Additionally, the California Air Pollution Control Officers Association White Paper on CEQA and Climate Change supports this conclusion by stating, “The full life-cycle of GHG [greenhouse gas] emissions from construction activities is not accounted for . . . and the information needed to characterize [life-cycle emissions] would be speculative at the CEQA analysis level.” Therefore, pursuant to CEQA Guidelines Sections 15144 and 15145, upstream/life cycle emissions are speculative and no further discussion is necessary.

The operational emissions for the project based on the anticipated 2017 opening year are shown in Table 38. As shown, the project would emit approximately 29,041 $MTCO_2e$ under the 2017 opening year scenario. For the complete assumptions, please refer to Appendix F.

Table 38: Project Operational Emissions

Source	Emissions (MTCO2e per year)
Area	<1
Energy	1,954
Mobile – Passenger Vehicles	2,948
Mobile - Trucks	23,175
Waste	780
Water	84
Construction Emissions Amortized over 30 years	102
Total	**29,041**

Notes:

Total $MTCO_2e$ may be different from CalEEMod output due to rounding.

$MTCO_2e$ = metric tons of carbon dioxide equivalents

7.2 - Impact Analysis

7.2.1 - Greenhouse Gas Inventory

Impact GHG-1: **The project would generate direct and indirect greenhouse gas emissions; however, these emissions would not result in a significant impact on the environment.**

Thresholds of Significance for this Project

As discussed in the Newall Ranch decision, a lead agency may asses the significance of GHG emissions by determining a project's consistency with a local GHG reduction plan or CAP that qualifies under Section 15183.5 of the CEQA Guidelines. The County of Riverside's CAP serves to fulfill this role.

The CAP is designed to ensure that the development accommodated by the buildout of the General Plan supports the goals of Assembly Bill (AB) 32—the Global Warming Solutions Act of 2006. The California Air Resources Board (ARB) adopted the State's strategy for achieving AB 32 targets in its Climate Change Scoping Plan (Scoping Plan) in 2008. The Scoping Plan greenhouse gas reduction goal is to reduce statewide emissions to 1990 levels by 2020. The Riverside County CAP includes strategies that will achieve this target. The CAP target is to reduce County emissions by the amount recommended in the Scoping Plan for local government of 15 percent below 2008 levels by 2020.

This was roughly equivalent to the 28.4 percent overall reduction in statewide emissions from business as usual in 2020. The strategy will continue to provide reductions past 2020 and includes a commitment to update the CAP beginning in 2017. The new plan will include a specific target for GHG reductions for 2035 and 2050. The targets will be consistent with broader state and federal reduction targets and with the scientific understanding of the needed reductions by 2050. The CAP includes analysis that includes the conceptual reductions required to achieve the percent reductions that would be required to achieve the levels needed to achieve the 2050 target outlined in Executive Order S-3-05, but the CAP does not include a comprehensive strategy to achieve the later targets pending adoption of a statewide strategy for those later years.

In determining whether the project conflicts with any applicable plan, policy, or regulation, the California Resources Agency has stated that in order to be used for the purpose of determining significance, a plan must contain specific requirements that result in reductions of greenhouse gas emissions to a less than significant level. The following from CEQA Guidelines Section 15083.5(b) lists the requirements for greenhouse gas reduction plans used for this purpose:

(1) Plan Elements. A plan for the reduction of greenhouse gas emissions should:
   (A) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
   (B) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;
   (C) Identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area;
   (D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
   (E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels;
   (F) Be adopted in a public process following environmental review.

(2) Use with Later Activities. A plan for the reduction of greenhouse gas emissions, once adopted following certification of an EIR or adoption of an environmental document, may be used in the cumulative impacts analysis of later projects. An environmental document that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project. If there is substantial evidence that the effects of a particular project may be cumulatively considerable notwithstanding the project's compliance with the

specified requirements in the plan for the reduction of greenhouse gas emissions, an EIR must be prepared for the project.

The CAP meets these requirements as shown below:

- The CAP quantifies emissions for a 2008 base year and future inventories for 2020, 2035, and 2050 for the County.
- The CAP has adopted a target of reducing GHG emissions down to 15 percent below 2008 levels within the County of Riverside by 2020. This reduction target is compliant with AB 32; the AB 32 Climate Change Scoping Plan states: "In recognition of the critical role local governments will play in the successful implementation of AB 32, ARB recommended a greenhouse gas reduction goal for local governments of 15 percent below today's levels by 2020 to ensure that their municipal and community-wide emissions match the State's reduction target" (Scoping Plan page ES-5, ARB December 2008). As such, the County is consistent with the State's efforts to reduce GHG emissions globally and substantially lessen the cumulative contribution.
- The CAP analyzed the GHG emissions resulting from specific sources under the jurisdiction of the County or within the County's ability to influence including source categories common to most climate action plans in California.
- The CAP identified specific measures that would reduce GHG emissions by the required amount from regulations that apply to existing and new development and local measures that apply to the sources of emissions including:
  - Land Use and Transportation
  - Transportation Facilities Strategies
  - Transportation Demand Strategies
  - Energy Conservation Strategies for New and Existing Buildings
  - Waste Diversion and Recycling and Energy Recovery
  - Strategies for Existing Development
  - Municipal Strategies
- The CAP includes procedures for tracking and monitoring plan performance measures including annual and triennial data collection and reporting to identify trends and potential shortfalls requiring corrective actions.
- The CAP was included as part of the General Plan Update Master Environmental Impact Report and was adopted and certified in a public hearing on December 08, 2015.
- The CAP includes binding and enforceable requirements that apply to development projects to ensure plan consistency. All emission reductions required to reach the plan 2020 targets are achieved through compliance with adopted regulations, ordinances, and code enforced by the State and the County. Reductions from mobile sources anticipated through implementation of the County's land use plan are enforced through the development review process. Conditions of approval may be applied for measures requiring project specific actions not specifically addressed by the regulation or code.

The point values in the Screening Tables were derived from the projected emissions reductions that each of the Implementation Measures (IM) within the Riverside County GHG Technical Report would achieve. The total emission reductions offered by each measure is based on both changes in existing land use activities as well as how new development is designed and built. In order to correctly allocate the emission reductions within the Screening Table, the amount of emission reductions afforded new development had to be segregated out of the aggregate total in a manner that is described below. Once the process of segregating new development out of the aggregate reduction totals was completed, the points were then proportioned by residential unit or square feet of commercial/industrial uses. This was accomplished by taking the predicted growth in households and commercial/industrial uses by the year 2020 and proportioning the appropriate IM reduction quantities for new development to the residential and commercial/industrial land use sectors within the Screening Table. These calculations result in point values that are allocated by residential unit or commercial/industrial square footage (measured in 1000 sq.ft.). Because of this, the size of the project is not relevant to the Screening Table. Regardless of size, each project needs to garnish 100 points to demonstrate consistency with the Technical Report. Efficiency, not size of the Project is critical. The following emission factor can be used in determining the amount of emissions reduced per point in the Screening Table:

- The respective calculated emission values are in metric tons of carbon dioxide equivalents (MTCO2e)
- For Residential Projects: 0.069 MTCO2e per Point per Residential Unit
- For Commercial and Industrial Projects: 0.031 MTCO2e per Point per 1,000 Square Feet of gross Commercial/Industrial building area
- The first step in developing the point system was the need to determine the total reductions afforded the GHG Plan. In total 4,288,863 MTCO2e will be reduced as a result of the GHG Plan.

As shown in the GHG Plan, 1,807,866 MTCO2e will be reduced through State strategies. The next step in developing the point system is to segregate out the County's efforts in reducing GHG emissions. As shown in the GHG Plan, 2,448,997 MTCO2e are reduced by the County's Implementation Measures. This amount includes reductions afforded existing building retrofits, other changes to activities associated with existing land uses, as well as reductions associated with new development.

The next step is to segregate out of the 2,448,997 MT CO2e that the County needs to reduce, the total the amount of emissions that will be reduced by new development.

The GHG Plan summarizes the reduction in emissions afforded new development from the Implementation measures. As summarized in the GHG Plan, 1,302,569 MTCO2e will be reduced from new development as a result of the County strategies. Within the 1,302,569 MTCO2e of new development reductions afforded County strategies, 619,336 MTCO2e of emissions reduced is accomplished through new Commercial and Industrial Projects, and 683,233 MTCO2e of emissions reduced is accomplished through new residential projects.

CVAR_08765

The next step in allocating point values is to determine the number of new homes and commercial buildings that are anticipated by year 2020. The County predicts that 100,477 new residential units will be needed by 2020 to accommodate the population growth by 2020. A total of approximately 195,547,000 square feet of new commercial and industrial buildings within the unincorporated County area is needed to accommodate anticipated job growth. This estimate is based on the relationship between past growth in employment to the average growth in commercial/industrial building area for Riverside County.

Dividing the 683,233 MTCO2e reductions of emissions afforded the Implementation Measures for new residential development by the anticipated 100,477 new residential units that will be built yields 6.80 MTCO2e per residential unit that needs to be reduced to fulfill the anticipated reductions of the GHG Technical Report. That amount equals 100 points, producing the following for the point values: 0.0680 MTCO2e per Point per Residential Unit

A similar process was used to derive the point value for new commercial/Industrial development. Because commercial/industrial land uses are typically described in thousand square feet of building space, the point value was calculated as follows: 0.031 MTCO2e per 1,000 Sq. Ft. of gross Commercial/Industrial building area.

The final step was to allocate points to each of the reduction measures in order to provide the menu of point values. Table 3.7-3 shows the requisite points afforded each measure. Note that emissions associated with new development are reduced by the State's measures, as well as the County's Implementation measures. The Screening Tables focus on those measures the County is implementing associated with new development within the unincorporated County area. For this reason, the menu of options pertains to all of the Implementation Measures pertaining to new development.

Pursuant to the CAP, Projects that achieve at least 100 points based on the County's screening tables are determined to be consistent with the reduction quantities anticipated in the County's GHG Technical Report. As such, further project-specific GHG quantification is not required. Consistent with CEQA guidelines, such projects would be determined to have a less than significant individual and cumulative impact for GHG emissions.

In order to enforce the requirements of the CAP Screening Tables, Mitigation Measure GHG-1 requires that the project implement at least 100 points from the Riverside County Greenhouse Gas Emissions Screening Tables. Table 39 displays the points that are anticipated to be used by the project; during construction and operation of the project, the points may be switched for feasibility. Therefore, since the project will incorporate at least 100 points from the screening tables, the project's impact on greenhouse gas emissions is less than significant.

Table 39: County of Riverside Greenhouse Gas Screening Table

Feature	Description	Project Consistency	Points
E5.A.1	Insulation: Modestly enhance insulation (walls R-13, roof/attic R-38)	The project will satisfy this measure by installing wall insulation rated at R-13 or better and roof/attic insulation at R-38 or better for the office portions of the building.	15
E5.A.2	Window Insulation: Modestly enhanced window insulation (5% > Title 24)	The project will satisfy this measure by installing windows with insulation that exceeds the incumbent 2013 Title 24 standards by a minimum of 5 percent.	7
E5.A.4	Air infiltration: Minimizing leaks in the building envelope is as important as the insulation properties of the building. Insulation does not work effectively if there is excess air leakage. Modest Building Envelope Leakage (5% > Title 24).	The project will satisfy this measure by designing the building envelope to ensure that there is minimal building envelope leakage for the conditioned space. The building envelope will exceed the incumbent 2013 Title 24 standards by a minimum of 5 percent.	4
E5.B.1	Heating/Cooling Distribution System: Minimum Duct Insulation (R-4.2 required)	—	0
E5.B.2	Space Heating/Cooling Equipment: High efficiency HVAC (EER15/72% AFUE or 8.5 HSPF)	The project will satisfy this measure by installing a high efficiency HVAC unit rated EER15/72% AFUE or 8.5 HSPF or better.	8
E5.B.4	Water Heaters: 2008 Minimum Efficiency (0.57 Energy Factor)	—	0
E5.B.5	Daylighting: All rooms within building have daylight (through use of windows, solar tubes, skylights, etc.)	The project will satisfy this measure by installing daylighting such that all of the conditioned space will have daylight through the use of windows, solar tubes, skylights or equivalents. For example, the warehouse buildings will have skylights and the office areas will contain windows.	5
E5.B.6	Artificial Lighting: High efficiency lights (50% of in-unit fixtures are high efficacy)	The project will satisfy this measure by installing high efficacy lighting at a minimum of 50 percent of the in-unit lighting fixtures.	12
E6.A.1	Solar Photovoltaic panels: 23 percent of the power needs of the project	As identified in the Project Description, Section 2.3.1 of the DEIR, the project includes the use of solar panels on its roofs, which would provide approximately 23 percent of the project's power needs.	14
W1.C.1	Water Efficient Landscaping: Eliminate turf and only provide drought tolerant plants	The project will satisfy this measure through compliance with the landscaping plan that identifies the use of drought tolerant plants.	4

Table 39 (cont.): County of Riverside Greenhouse Gas Screening Table

Feature	Description	Project Consistency	Points
W1.C.2	Water Efficient Irrigation Systems: Weather based irrigation control systems combined with drip irrigation (demonstrate 20 percent reduced water use)	The project will satisfy this measure through compliance with the MWELO as required by the Riverside County Ordinance 859.2. Implementation of the MWELO will result in a minimum of 20 percent reduced water use for outdoor irrigation. Specifically, the irrigation system will be designed utilizing "state of the art" irrigation equipment such as smart controllers, rain shut-off devices, master valves and flow sensors, as well as water-efficient irrigation heads. Plant materials will also be separated by hydrozones.	5
W1.D.1	Showers: Water Efficient Showerheads (2.0 gpm) Title 24 standard (required)	The project will satisfy this measure through compliance with the 2013 California Plumbing Code Section 408.0 Showers, showerheads shall have a maximum flow rate of 2.0 gallons per minute consistent with 2013 CALGreen which currently applies to the project.	3
W1.D.2	Toilets: Water Efficient Toilets/Urinals (1.5gpf)	The project will satisfy this measure through compliance with the 2013 California Plumbing Code Section 403.2.1 Water Closets, either flush tank, flushometer tank, or flushometer valve operated, shall not exceed the effective flush volume of 1.28 gallons. Urinals shall have an average water consumption not to exceed 0.125 gallon per flush. Both of these requirements are consistent with 2013 CALGreen, which currently applies to the project.	3
W1.D.3	Faucets: Water Efficient faucets (1.28gpm)	The project will satisfy this measure through compliance with the 2013 California Plumbing Code Section 403.8 Lavatory Faucets, the maximum flow rate of lavatory faucets shall not exceed 1.0 gallon per minute.	3
T1.A.2	Car/vanpools: Car/vanpool program with preferred parking	The project will satisfy this measure through compliance with the 2013 Cal Green Code section 5.106.5.2, the project will provide designated parking stalls for low-emitting, fuel-efficient, and/or carpool/vanpool vehicles. As such, the project will provide a minimum of 36 preferred parking spaces for car/vanpools or low-emitting/fuel efficient vehicles.	2
T1.A.3	Bike lockers and secure racks Showers and changing facilities	The project will satisfy this measure through compliance with MM AQ-8 c) which requires that, each building shall provide secure	3

Table 39 (cont.): County of Riverside Greenhouse Gas Screening Table

Feature	Description	Project Consistency	Points
		bicycle storage space equivalent to two percent of the automobile parking spaces provided. Pursuant to MM AQ-8 d) Each building shall provide a minimum of two shower and changing facilities within 200 yards of a building entrance.	
T4.A.1	Parking: Provide reserved preferential parking spaces for car-share, carpool, and ultra-low or zero emission vehicles.	The project will satisfy this measure through compliance with MM AQ-8 e) which requires that, each building shall provide preferred parking for low-emitting and fuel-efficient vehicles equivalent to 5 percent of the required number of parking spaces. This measure is also consistent with 2013 Cal Green Code section 5.106.5.2, which requires that the project provide designated parking stalls for low-emitting, fuel-efficient, and/or carpool/vanpool vehicles for 5 percent of required spaces. As such, the project will provide a minimum of 36 preferred parking spaces for car-share, carpool, and ultra-low or zero emission vehicles.	1
T7.B.1	Electric Vehicle Recharging: Install electric vehicle charging stations in parking areas.	The project will satisfy this measure through compliance with MM AQ-8 b) which requires that, a minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building. As such, the project will provide a minimum of four electric vehicle-charging stations for automobiles or light-duty trucks at the site.	16
T8.A.1	Vehicle Idling Restriction: All commercial vehicles are restricted to 5-minutes or less per trip on-site and at loading docks	The project will satisfy this measure through compliance with, MM AQ-7 b), which requires the project to post signs in all dock and delivery areas containing the following: truck drivers shall turn off engines when not in use; trucks shall not idle for more than five minutes; telephone numbers of the building facilities manager and the California Air Resources Board to report violations.	2
L2.B.1	Landscaping Equipment: Project provides electrical outlets on the exterior of all buildings so that electric landscaping equipment is compatible with all built facilities	The project will satisfy this measure through installation of electrical outlets on the exterior of all buildings.	2
SW1.B.1	Recycling: Provide separated recycling bins within each building/floor and provide large	The project will satisfy this measure through requiring the provision of separated recycling bins within each building and will	2

Table 39 (cont.): County of Riverside Greenhouse Gas Screening Table

Feature	Description	Project Consistency	Points
	external recycling collection bins at central location for pick-up	include a recycling collection bin for pick-up by the local waste hauler consistent with the requirements of Assembly Bill 341.	
SW2.B.1	Recycling of Construction/Demolition Debris: Recycle at least 20 percent of debris	The project will satisfy this measure by requiring that the project will implement and develop a plan to recycle a minimum of 20 percent of construction debris.	6

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Implement Mitigation Measures AQ-7 and AQ-8, which serve to reduce mobile source emissions, and the following:

MM GHG-1 Prior to issuance of building permits, the applicant shall provide documentation to the County of Riverside Building Department demonstrating that the project will implement the above described project features that will achieve at least 100 points from the Riverside County Greenhouse Gas Emissions Screening Tables or achieve equivalent emission reductions from other measures approved by the County of Riverside.

Level of Significance After Mitigation

Less than significant impact.

Greenhouse Gas Reduction Plans

Impact GHG-2: The project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Impact Analysis

Impact GHG-2 assesses the project's consistency with the overarching goals of AB 32 and the strategies of ARB's Scoping Plan as well as the regulatory measures adopted to further AB 32's goals.

CEQA allows lead agencies to consider whether regulatory programs are adequate to reduce a project's potentially significant environmental effects. Under AB 32, the State's emission inventory must be reduced to 1990 levels by 2020. One of the questions in the CEQA Guidelines checklist regarding GHG asks whether a project conflicts with any applicable plan, policy, or regulation of an

agency adopted for the purpose of reducing the emissions of greenhouse gases. The ARB Scoping Plan and its implementing regulations provide the regulatory framework for the State to achieve its target and to track its progress. Moreover, *Newhall Ranch* describes that a lead agency may assess consistency with AB 32's goal in whole or in part by looking to compliance with regulatory programs designed to reduce GHG emissions from particular activities … [Newhall, p. 25.] *Newhall Ranch* further describes that "[t]o the extent a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by the Air Board or other state agencies, a lead agency could appropriately rely on their use as showing compliance with 'performance based standards' adopted to fulfill 'a statewide . . . plan for the reduction or mitigation of greenhouse gas emissions.' (CEQA Guidelines § 15064.4(a)(2), (b)(3); see also id., § 15064(h)(3) [determination that impact is not cumulatively considerable may rest on compliance with previously adopted plans or regulations, including 'plans or regulations for the reduction of greenhouse gas emissions'].)"

An important underlying assumption when making a significance determination based on compliance with regulations is that the regulations are adequate to address the impact to a less than significant level. If compliance with regulations is sufficient to mitigate the impact to a less than significant level, then a project is not required to provide any additional mitigation to further reduce the impact. If, however, regulations are only partially effective in mitigating the impacts, or if the regulatory program is not fully implemented, there may be a gap between the amount that can be reasonably claimed from regulation and the amount needed to achieve the less than significant target.

The CARB 2008 Scoping Plan includes a regulatory strategy that will result in the State achieving the AB 32 target by 2020, accounting for growth projected by 2020. The measures in the 2008 Scoping Plan have all been in place since 2012. In the 2014 Scoping Plan Update was adopted in May 2014, however, ARB confirmed that the State had now adopted sufficient laws and regulations to achieve the AB 32 target and no new measures or targets were identified.

Measures of Plan Consistency or Conflict

Determining project consistency with greenhouse gas plans presents unique challenges because the impact is global and inherently cumulative in nature and the solutions require global and local action. A single state or nation or project cannot solve the problem and there are no binding international agreements in place that will achieve the amount of reductions scientists estimate will be required to prevent catastrophic climate change. California recognized this and decided to identify reduction targets for itself in AB 32 that would lead to California providing its fair share of reductions regardless of what other states or the federal government or other countries do to reduce their fair share. This leadership by example is hoped to spur other governments to take action to reduce their greenhouse gas impacts. California through AB 32 set its fair share reduction at the amount required to reduce emissions to 1990 levels by 2020.

The analysis below qualitatively examines the measures contained in the applicable plans and subsequent adopted regulations and how they interrelate with the project to achieve the State's goals.

Applicable Plans

The Scoping Plan provides the State's overall strategy in the form of measures that apply to emission sectors that comprise the State's greenhouse gas emission inventory. The Scoping Plan is the State's view from 30,000 feet for achieving the AB 32 mandates. The State's on-the-ground implementation strategy primarily takes the form of source specific regulations adopted by State agencies such as ARB, and the CEC. The State has adopted regulations described earlier in this section to implement the Scoping Plan measures and achieve the emission reductions required. The Scoping Plan envisions a limited role for local government in implementing the State's GHG reduction strategy focusing on local government's authority over land use and some transportation projects.

Relating Plans to Projects

The ARB Scoping Plan examines California's greenhouse gas profile in two ways – emissions-based and end use (demand side)-based. While it is possible to illustrate the inventory many different ways, no chart or graph can fully display how diverse economic sectors fit together. California's economy is a web of activity where seemingly independent sectors and subsectors operate interdependently and often synergistically. For example, reductions in water use reduce the need to pump water, directly lowering electricity use and associated greenhouse gas emissions. Similarly, reducing the generation of waste reduces the need to transport the waste to landfills – lowering transportation emissions and, possibly, landfill methane emissions. Increased recycling or re-use reduces the carbon emissions embedded in products – it takes less energy to make a soda can from recycled aluminum than from virgin feedstock.

Development projects are assessed for direct emissions from combustion of fuels for heating buildings and indirect emissions for fuel use from transportation activities associated with the project. Development projects are also end users of electricity that is often generated by power plants that are located far from the project site. Project emissions from electricity consumption are based on the projected use and the average emission rate for the electric utility serving the project.

The regulations implementing the Scoping Plan apply directly to the project in regards to energy efficiency of the buildings, water conservation, and refrigerant usage. Scoping Plan measures regarding motor vehicle fuel efficiency apply to vehicle manufacturers, but result in lower emissions from vehicles accessing the project site. The Renewable Portfolio Standard applies to electric utilities, but reduce emissions related to electricity used by the project. Transportation sector measures from the Scoping Plan are also implemented through SB 375 - The Sustainable Communities and Climate Protection Act of 2008 which targets emissions from the transportation system through actions that make transportation more efficient at the regional level. Individual development projects have no direct requirements from SB 375 but may benefit from being located in areas designated as Transit Priority Areas and from system-wide infrastructure improvements that reduce congestion and improve traffic flow for all system users.

Development projects are constructed to accommodate California's population and economic growth accounted for by the Scoping Plan. As described above, the regulations implementing the Scoping Plan touch many of the operations of the buildings and the day to day activities of people that will work and shop at the project. Most of the greenhouse gas regulations apply behind the scenes so that they are not noticed by end users of the project except to the extent that the types of

cars available for purchase are more fuel efficient. The developer is directly impacted by building energy efficiency and conservation regulations that must be followed during building construction. The cost of the efficiency measures is built into the construction cost of the building and rents but the owners and tenants benefit from lower energy bills and water bills resulting from the increased energy efficiency.

The Scoping Plan includes measures that reduce emissions from the following sectors:

- Transportation
- Electricity and Natural Gas
- Water
- Green Building
- Industry
- Recycling and Waste Management
- Forests
- High Global Warming Potential
- Agriculture

The 2008 Scoping Plan included 18 measures to reduce emissions from the various sectors. The measures often overlap and have interdependent relationships with other measures as described earlier. The measures are implemented with regulations and programs applicable to specific sources of emissions. More detailed descriptions of the measures are provided in Scoping Plan Appendix C, Sector Overview and Emission Reduction Strategies. The State has been very aggressive in adopting regulations to implement the Scoping Plan and as a result, the state is on track to achieve the 2020 target as discussed above.

Most of the reductions required to reach AB 32's 2020 reduction target will be achieved by regulations that apply to both existing and new development, including the RPS, Pavley standards, LCFS, landfill regulations, regulations and programs on high global warming potential (GWP) gases, initiatives on water conservation (such as SB X7-7), and the indirect influence of the Cap and Trade system on electricity and transportation fuel prices.

The Project's significance with respect to consistency with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emission have been evaluated below and addressed for each sector.

Transportation

Approximately 90 percent of the Project's opening year GHG emissions as summarized in Table 3.7-2 are from transportation (mobile sources), heavy-duty trucks in particular. Transportation emissions are heavily regulated at the source, including, but not limited to engine emissions standards and fuel requirements. Because these regulations and policies reduce GHG emissions at the source, the Project will be subject to and therefore not conflict with these transportation measures.

State Regulations/Scoping Plan Measures

Adopted regulations that will reduce the Project's GHG emissions through engine emission standards and fuel requirements are described in detail in Section 3.7.2 above. These regulations include:

California Light-Duty Vehicle Greenhouse Gas Standards

AB 1493/Pavley I and II required CARB to adopt regulations to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks of model year 2009 through 2016.

The standards phase in during the 2009 through 2016 model years. When fully phased in, the near-term (2009–2012) standards will result in about a 22-percent reduction compared with the 2002 fleet, and the mid-term (2013–2016) standards will result in about a 30-percent reduction. The second phase of the implementation for the Pavley bill was incorporated into Amendments to the Low-Emission Vehicle Program referred to as LEV III or the Advanced Clean Cars program. The Advanced Clean Car program combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of requirements for model years 2017 through 2025. The regulation will reduce GHGs from new cars by 34 percent from 2016 levels by 2025.

This measure applies to all new passenger vehicles starting with model year 2009. The project is consistent with this measure and its implementation as it would apply to all new passenger vehicles purchased in California. As such, any passenger vehicles associated with construction and operation of the project would be required to comply with the Pavley emissions standards.

Executive Order S-01-07 – Low Carbon Fuel Standard (LCFS)

The LCFS regulation became fully effective in 2010 and will reduce GHG emissions by reducing the carbon intensity of transportation fuels used in California by at least 10 percent by 2020. The proposed Project will utilize these emissions reductions as they are implemented into 2020 from all operational mobile emissions sources.

This measure applies to transportation fuels utilized by vehicles in California. The project is consistent with this measure and its implementation as motor vehicles associated with construction and operation of the project would utilize low carbon transportation fuels as required under this measure.

Medium/Heavy-Duty Vehicles

As part of the Heavy-duty Vehicle Greenhouse Gas Regulation, CARB also implemented the Drayage Truck Regulation and Truck and Bus Regulation. These three regulations were collectively adopted to address and reduce emissions from trucks. Since the proposed Project has a large truck component, these regulations will aid in reducing GHG emissions from the Project.

This measure applies to medium and heavy-duty vehicles that operate in the state, and thus would apply to medium and heavy-duty vehicles that serve the project. The project is consistent with this measure and its implementation as medium and heavy-duty vehicles associated with construction and operation of the project would be required to comply with the requirements of this regulation.

Tractor-Trailer Greenhouse Gas Regulation

The tractors and trailers subject to this regulation must either use EPA SmartWay certified tractors and trailers, or retrofit their existing fleet with SmartWay verified technologies. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the heavy-duty tractors that pull them on California highways. The Project is consistent with this measure and its intended implementation as the project will be required to become a SmartWay Partner and the facility operator will be required to incorporate incentives and requirements such that a maximum feasible number of truck trips will be carried by SmartWay 1.0 or greater carriers pursuant to MM AQ-7 e) and MM AQ-7 f).

Cap-and-Trade Program

Notably, the Cap-and-Trade Program covers transportation fuel suppliers to address emissions from fuels and from combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period. While the Cap-and-Trade Program technically covered fuel suppliers as early as 2012, they did not have a compliance obligation until 2015. The Cap-and-Trade Program covers the GHG emissions associated with the combustion of transportation fuels in California, whether refined in-state or imported. The point of regulation for transportation fuels is when they are supplied, or delivered into commerce. Accordingly, as with stationary source GHG emissions and GHG emissions attributable to electricity use, virtually all of GHG emissions from CEQA projects associated with VMT are covered by the Cap-and-Trade Program.

In September 2013, the SCAQMD adopted two Negative Declarations stating that GHG emissions subject to the CARB Cap-and-Trade Program do not count against the 10,000 MT CO2e significance threshold the SCAQMD applies when acting as a lead agency. In addition, the San Joaquin Valley Air Pollution Control District (SJVAPCD) has recently taken this one issue step further and adopted a policy: "CEQA Determinations of Significance for Projects Subject to CARB's GHG Cap-and-Trade Regulation." This policy applies when the SJVAPCD is the lead agency and when it is a responsible agency. In short, the SJVAPCD "has determined that GHG emissions increases that are covered under CARB's Cap-and-Trade regulation cannot constitute significant increases under CEQA…." The SJVAPCD classifies CARB's Cap-and-Trade Program as an approved GHG emission reduction plan or GHG mitigation program under CEQA Guidelines Section 15064(h) (3). The policy acknowledges that "combustion of fossil fuels including transportation fuels used in California (on and off road including locomotives), not directly covered at large sources, are subject to Cap-and-Trade requirements, with compliance obligations starting in 2015." As such, the SJVAPCD concludes that GHG emissions associated with vehicle miles traveled (VMT) cannot constitute significant increases under CEQA. This regulatory conclusion is therefore directly applicable to the proposed Project because VMT is by far the largest source of project GHG emissions.

Since the proposed Project has a large mobile source component and Cap-and-Trade emission reductions are difficult to calculate on a project-level, the proposed Project's mobile source emissions are very conservative, making the total emission calculations conservative. The phase-in of the Cap-and-Trade Program compliance obligations for transportation fuel providers further reduces GHG emissions attributable to mobile sources, beyond the GHG emissions reductions achieved and modeled by the Pavley Standard and LCFS.

CVAR_08775

Regional and Local Measures

Southern California is a major hub for importing and exporting goods. SCAG estimates that over $2 trillion in cargo was moved across the region in 2010 alone, much of which travels through inland Southern California, including Western Riverside County. However, the many warehouses and distribution facilities employ non-passenger vehicles that contribute to GHG emissions. At the state level, more standards are being implemented to increase vehicle efficiencies and the 2012 RTP/SCS and SCAQMD are supporting greater penetration of low-emission trucks in the region. While goods will continue to be moved to support local and regional economies, electrification and other low-emission technologies installed in vehicles can reduce the GHG emissions of goods movement.

The Inland Empire is the heart of the region's warehouse Goods Movement network for goods that enter the Ports and are moved east to the rest of the country. The entire Goods Movement network is based on the Ports of Los Angeles/Long Beach (Ports of LA/LB) and all truck trips generated by the Project are conservatively assumed to come from the Ports of Los Angeles/Long Beach (Ports of LA/LB). The Ports have adopted several plans and policies to reduce GHG emissions including Green LA: An Action Plan to Lead the Nation in Fighting Global Warming, the Port of LA CAP, the Long Beach Sustainable City Action Plan, and the San Pedro Bay Ports Clean Air Action Plan.

As identified in the Riverside County CAP, the County has adopted several General Plan Policies that reduce automobile use and consequently GHG emissions, these measures go above and beyond the regulatory requirements of AB 32. A summary of applicable measures identified in the CAP are as follows:

R2-T1: Employment Based Trip and VMT Reduction

This measure would implement General Plan Policies AQ 3.3, AQ 10.1, AQ 10.3, and AQ 10.4 through the adoption of a voluntary trip reduction program for new commercial and industrial development that promotes commuter choices, employer transportation management, guaranteed ride home programs and commuter assistance and outreach type programs intended to reduce commuter vehicle miles traveled. The Project is consistent with this measure and its intended implementation as the project will be required to participate in Riverside County's Rideshare Program pursuant to MM AQ-8 a).

R2-T4: Preferential Parking

This measure would implement General Plan Policies AQ 3.3 and AQ 10.3 by encouraging proposed development projects to incorporate a comprehensive parking program to facilitate carpooling and alternate transportation. The Project is consistent with this measure and its intended implementation as the project will be required, pursuant to MM AQ-8 b) and MM AQ-8 e) to install a minimum of two electric-vehicle charging stations per building, and each building shall provide preferred parking for low-emitting and fuel-efficient vehicles equivalent to 5 percent of the required number of parking spaces.

R2-T5: Roadway Improvements Including Signal Synchronization and Transportation Flow Management

This R2 measure would implement General Plan Policies AQ 12.1 and AQ 12.3. Proposed development projects that pay fare-share fees toward signal synchronization improvements or construct signalized intersections within a traffic signal synchronization system. These modifications

include, but are not limited to, synchronization of signals, improvement of traffic flow, the development of parallel roadways and support for the extension of freight rail into Riverside County's industrial areas. The project is consistent with this measure as it will implement any required traffic signal synchronization or construction of new traffic signals as identified in the project's traffic impact analysis.

Project Design Features and Mitigation Measures

Lastly, the project will incorporate several project design features and mitigation measures that will further reduce the Project's GHG emissions from transportation. These measures further support the AB 32 / Scoping Plan reduction goals. A summary of mitigation measures that will reduce transportation-related GHG emissions are as follows:

MM AQ-2 All Heavy-Heavy Duty Haul Trucks (HHD) accessing the project site shall use year 2007 or newer engines during all construction activities.

MM AQ-7 The project shall implement the following measures to reduce emissions from onsite heavy duty trucks within six months after operations commence:

b) Post signs in all dock and delivery areas containing the following: truck drivers shall turn off engines when not in use; trucks shall not idle for more than five minutes; telephone numbers of the building facilities manager and the California Air Resources Board to report violations.
c) Tenants shall maintain records on its fleet equipment and vehicle engine maintenance to ensure that equipment and vehicles serving the warehouses within the project are in good condition, and in proper tune pursuant to manufacturer's specifications. Tenants shall maintain records on its fleet equipment and ensure that all Heavy-Heavy Duty Trucks (HHD) accessing the project site use year 2010 or newer engines. The records shall be maintained onsite and be made available for inspection by the County.
d) The facility operator will ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at California Air Resources Board approved courses (such as the free, one-day Course #512).
e) Require facility operator to become a SmartWay Partner.
f) Require facility operator to incorporate incentives and requirements such that the maximum feasible number of truck trips will be carried by SmartWay 1.0 or greater carriers.

MM AQ-8 The following measures shall be incorporated into each building to reduce motor vehicle emissions:

a) All tenants shall participate in Riverside County's Rideshare Program. The purpose of the program would be to discourage single-occupancy vehicle trips and encourage alternate modes of transportation such as carpooling, transit, walking, and biking. The program shall provide employees with assistance in

using alternate modes of travel, including carpooling encouragement, ride-matching assistance, and vanpool assistance.

b) A minimum of two electric vehicle-charging stations for automobiles or light-duty trucks shall be provided at each building.
c) Each building shall provide secure bicycle storage space equivalent to two percent of the automobile parking spaces provided.
d) Each building shall provide a minimum of two shower and changing facilities within 200 yards of a building entrance.
e) Each building shall provide preferred parking for low-emitting and fuel-efficient vehicles equivalent to five percent of the required number of parking spaces.

Energy

The second largest source, approximately 7 percent, of GHG emissions shown in Table 3.7-2 from the Project is energy consumption from electricity and natural gas.

State Regulations/Scoping Plan Measures

Energy-related emissions are also heavily regulated at the source, including, but not limited to energy efficiency standards and renewable energy requirements. Because these regulations and polices reduce GHG emissions at the source, the Project will be subject to and therefore implement these energy measures.

Energy Efficiency – Title 24/CalGreen

As previously discussed in Section 3.7.2, the CEC indicates that the 2013 Title 24 standards will reduce energy consumption by 30 percent above that achieved by 2008 Title 24 (CEC 2012). More specifically, based on a comparison of 2008 to 2013 Title 24 reductions required, newly constructed non-residential buildings result in an overall reduction of approximately 22 percent energy demand. Additionally, the 2013 Title 24 standards currently in effect yield an approximately 68 percent energy savings when compared with the 2005 Title 24 standards (in place pre-AB 32)[11].

At this time, the 2013 Title 24 standards are currently in effect; notwithstanding, it is likely that by the time the building permits are processed for this Project, the 2016 Title 24 standards will be in effect (the 2016 Title 24 standards take effect on January 1, 2017). The analysis did not take any credit for implementation of the more restrictive 2016 Title 24 standards for which the CEC estimates will provide 5 percent electric energy savings from non-residential buildings compared to 2013 Title 24.[12]

The proposed Project is also subject to the CalGreen Code Title 24 building energy efficiency requirements that offer builders better windows, insulation, lighting, ventilation systems, and other features that reduce energy consumption in homes and businesses.

Renewable Portfolio Standard

As previously described above in Section 3.7.2, California's Renewable Portfolio Standard (RPS) requires retail sellers of electric services to increase procurement from eligible renewable energy sources to 33 percent of total retail sales by 2020 as established under SB 1078 and accelerated under SB 107 and SBX1-2. Additionally, SB 1368 prohibits any retail seller of electricity in California from entering into a long-term financial commitment for baseload generation if the GHG emissions are higher than those from a combined-cycle natural gas power plant. As a customer of Southern California Edison, the proposed Project will purchase from an increasing supply of renewable energy sources and more efficient baseload generations and thereby reduce GHG emissions.

Million Solar Roofs Program

The Million Solar Roofs Program set a goal to install 3,000 megawatts (MW) of new solar capacity by 2017 – moving the state toward a cleaner energy future and helping lower the cost of solar systems for consumers. The Million Solar Roofs Initiative is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time.

The project is consistent with this scoping plan measure as the project includes the use of solar panels on its roofs, which would provide approximately 23 percent of the project's power needs.

Regional and Local Measures

As identified in the Riverside County CAP, the County has adopted several General Plan Policies that reduce energy use and consequently GHG emissions, these measures go above and beyond the regulatory requirements of AB 32. A summary of applicable measures identified in the CAP are as follows:

R2-E5: Commercial/Industrial Energy Efficiency Program

This R2 measure would implement General Plan Policies AQ 5.2, AQ 5.4, LU 4.1e, OS 16.1 and OS 16.9, and involves the adoption of a Riverside County Program that facilitates the energy efficient design for new commercial buildings so that new commercial buildings are 5% to 20% more efficient than the current Title 24 Standards. The high end of this voluntary energy efficiency program is 10% greater than the minimum requirements of the LEED and ENERGY STAR programs. As energy efficiency standards increase, Riverside County may want to periodically re-evaluate their percentage beyond Title 24 goal to ensure it is still a feasibly achievable goal.

Commercial developments within the unincorporated portions of Riverside County are encouraged to participate in the voluntary Commercial Energy Efficiency Program. This voluntary program would set a minimum goal of achieving energy efficiency of 5% greater than current Title 24 Standards. Incentives to participate in this volunteer program would include prioritization and streamlining of the application process for commercial/industrial projects that achieve the minimum goal. The project is consistent with this measure as it will exceed the Title 24 Standards by a minimum of 5 percent pursuant to the Riverside County CAP Checklist implementation identified on Table 3.7-3 previously presented.

R2-E6: Commercial/Industrial Renewable Energy Program

This R2 measure would implement General Plan Policies OS 10.1, OS 11.2 and OS 11.3, and facilitate the voluntary incorporation of onsite renewable (solar or other renewable) energy generation into the design and construction of new commercial, office and industrial development.

The project is consistent with this measure as the project includes the use of solar panels on its roofs, which would provide approximately 23 percent of the project's power needs.

Project Design Features

Lastly, as identified in the Project Description, Section 2.3.1 of the DEIR, the project intends to construct buildings that will also be designed to provide CalGreen Standards with Leadership in Energy and Environmental Design (LEED) to be eligible for a Silver Certification level. This includes design considerations related to the building envelope, HVAC, lighting, and power systems. Additionally, the architectural expression such as roofs and windows in the buildings will relate to conserving energy.

For future office improvement, refrigerants and HVAC equipment will be selected to minimize or eliminate the emission of compounds that contribute to ozone depletion and global warming. Ventilation and HVAC systems will be designed to meet or exceed the minimum outdoor air ventilation rates described in the American Society of Heating, Refrigeration, and Air Conditioning Engineers (ASHRAE) standards and/or per California Title 24 requirements. Additionally, the proposed Project will implement design features for future office improvement to increase the efficiency of the building envelope (i.e., the barrier between conditioned and unconditioned spaces). This includes installation of insulation to minimize heat transfer and thermal bridging and to limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.

Water

GHG emissions also result from electricity consumption related to water supply, treatment, and distribution, as well as wastewater treatment. As shown in Table 3.7-2, the Project's GHG emissions related to water consumption are less than one percent of total GHG emissions.

State Regulations/Scoping Plan Measures

Renewable Portfolio Standard Related to Water Supply and Conveyance

This measure would increase electricity production from eligible renewable power sources to 33% by 2020. A reduction in GHG emissions results from replacing natural gas-fired electricity production with zero GHG emitting renewable sources of power. By 2020, this requirement will reduce emissions from electricity used for water supply and conveyance in California by approximately 21.3 MMT CO2e, representing 15.2% of emissions from electricity generation (in-state and imports).

As previously discussed, as a customer of Southern California Edison, the proposed Project will purchase from an increasing supply of renewable energy sources and more efficient baseload generations consistent with RPS and thereby reduce GHG emissions.

Model Water Efficient Landscape Ordinance (MWELO)

The Model Water Efficient Landscape Ordinance (Ordinance) was required by AB 1881, the Water Conservation Act. The bill required local agencies to adopt a local landscape ordinance at least as effective in conserving water as the Model Ordinance by January 1, 2010. Reductions in water use of 20 percent consistent with (SBX-7-7) 2020 mandate are expected upon compliance with the ordinance. Governor Brown's Drought Executive Order of April 1, 2015 (EO B-29-15) directed DWR to update the Ordinance through expedited regulation. The California Water Commission approved the revised Ordinance on July 15, 2015 effective December 15, 2015. New development projects that include landscape areas of 500 square feet or more are subject to the Ordinance.

The project is required to comply with the MWELO as required by Riverside County Ordinance 859.2 which will result in a minimum of 20 percent reduced water use for outdoor irrigation. The project is consistent with this measure as it will result in a minimum 20 percent reduced water use pursuant to the Riverside County CAP Checklist implementation identified on Table 3.7-3 previously presented.

Regional and Local Measures

As identified in the Riverside County CAP, the County has adopted several General Plan Policies that reduce water use and consequently GHG emissions, these measures go above and beyond the regulatory requirements of AB 32. A summary of applicable measures identified in the CAP are as follows:

R2-W1: Water Use Reduction Initiative

This measure would implement General Plan Policies LU 4.1d and f, C 5.2 and OS 2.1 through OS 2.4 and provide incentives for all new proposed development projects to comply with the California Green Building Standards Code. Under the California Green Building Code, new developments are required to reduce indoor potable water use by 20% beyond the Energy Policy Act of 1992 fixture performance requirements, and to reduce outdoor potable water use by 50% from a mid-summer baseline average consumption through irrigation efficiency, native plant selection, the use of recycled water and/or captured rainwater, for example. The state is dependent upon local water purveyors and jurisdictions to implement these new requirements.

The project is consistent with this measure as it will provide water efficient landscaping, irrigation, showerheads, toilets, and faucets pursuant to the Riverside County CAP Checklist implementation identified on Table 3.7-3 previously presented.

Project Design Features/Mitigation

The proposed Project will implement a drought tolerant landscape plan that identifies the use of drought tolerant plants. The project will also provide water efficient landscaping, irrigation, showerheads, toilets, and faucets pursuant to the Riverside County CAP Checklist implementation identified on Table 3.7-3 previously presented.

Waste Diversion

Disposal of solid waste in landfills contributes approximately three percent of GHG emissions from the project as shown on Table 3.7-2.

State Regulations/Scoping Plan

The CARB Scoping Plan recommends three measures for reducing emissions from Municipal Solid Waste at the state level, including: 1) landfill methane control; 2) increase the efficiency of landfill methane capture; and 3) high recycling/zero waste. CARB is in the process of developing a discrete early action program for methane recovery (1), which was adopted in early 2010. This measure is expected to result in a 1.0 MMT CO2e reduction by 2020. Other measures proposed by CARB include increasing efficiency of landfill methane capture (2) and instituting high recycling/zero waste policies (3). Potential reductions associated with these measures are still to be determined.

Implementation of the CalGreen code and state measures reduce the amount of solid waste disposed of in landfills. The CalGreen code requires jurisdictions to divert a minimum of 50% of their nonhazardous construction and demolition waste from landfills. The City of Riverside reported a 64 percent waste diversion rate for the year 2006. In addition SB 341 amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75 percent of solid waste generated be source reduced, recycled, or composted by the year 2020, and annually thereafter. The proposed Project is subject to these regulations as well as SB 341's policy goal and thereby reduce GHG emissions.

Regional and Local Measures

As identified in the Riverside County CAP, the County has adopted several General Plan Policies that reduce waste and consequently GHG emissions, these measures go above and beyond the regulatory requirements of AB 32. A summary of applicable measures identified in the CAP are as follows:

R2-S1: County Diversion Program

This R2 measure would implement General Plan Policy AQ 4.1 and AQ 5.1 through a countywide waste diversion plan to further exceed the state requirements by diverting 75% of all waste from landfills by 2020. The following is a potential list of waste reduction measures that can be incorporated into development projects that will further strengthen existing waste reduction/diversion programs:

- Encourage commercial, office, and industrial development to adopt a voluntary procurement standard and prioritize those products that have less packaging, are reusable, recyclable, or compostable;
- Include recycling and green waste collection infrastructure (assigned areas with separate designated bens for each type of recycled material) within residential, commercial, and industrial development;
- Require a minimum of 15% of materials used in construction be sourced locally, as feasible; and

- Encourage the use of recycled building materials and cement substitutes for new developments.

The project is consistent with this measure as it will provide separated recycling bins within each building and a large external recycling collection bin, the project will also implement and develop a plan to recycle a minimum of 20 percent of construction debris pursuant to the Riverside County CAP Checklist implementation identified on Table 3.7-3 previously presented.

Project Design Features/Mitigation

As discussed previously, the project will provide separated recycling bins within each building and a large external recycling collection bin, the project will also implement and develop a plan to recycle a minimum of 20 percent of construction debris pursuant to the Riverside County CAP Checklist implementation identified on Table 3.7-3 previously presented.

Consistency with Executive Orders S-3-05 and B-30-15

At the state level, Executive Orders S-3-05 and B-30-15 are orders from the State's Executive Branch for the purpose of reducing GHG emissions. The goal of Executive Order S-3-05 is to reduce GHG emissions to 1990 levels by 2020 was codified by the Legislature as the 2006 Global Warming Solutions Act (AB 32). The Project, as analyzed above, is consistent with AB 32. Therefore, the Project does not conflict with this component of Executive Order S-3-05. The Executive Orders also establish goals to reduce GHG emissions to 40 percent below 1990 levels by 2030 and 80 percent below 1990 levels by 2050. These goals have not been codified. However, studies have shown that, in order to meet the 2030 and 2050 targets, aggressive technologies in the transportation and energy sectors, including electrification and the decarbonization of fuel, will be required. In its Climate Change Scoping Plan, ARB acknowledged that the "measures needed to meet the 2050 are too far in the future to define in detail." In the First Scoping Plan Update, however, ARB generally described the type of activities required to achieve the 2050 target: "energy demand reduction through efficiency and activity changes; largescale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and rapid market penetration of efficiency and clean energy technologies that requires significant efforts to deploy and scale markets for the cleanest technologies immediately." Due to the technological shifts required and the unknown parameters of the regulatory framework in 2030 and 2050, quantitatively analyzing the Project's impacts further relative to the 2030 and 2050 goals is speculative for purposes of CEQA. Moreover, ARB has not calculated and released the BAU emissions projections for 2030 or 2050, which are necessary data points for quantitatively analyzing a CEQA project's consistency with these targets (ARB 2014).

Although the proposed Project's emissions levels in 2030 and 2050 cannot be reliably quantified, statewide efforts are underway to facilitate the State's achievement of that goal and it is reasonable to expect the proposed Project's emissions level (14,008 metric tons of CO_2e per year) to decline as the regulatory initiatives identified by ARB in the First Scoping Plan Update are implemented, and other technological innovations occur. Stated differently, the proposed Project's emissions total presented in Table 3.6-7, represents the maximum emissions inventory for the Project as California's emissions sources are being regulated (and foreseeably expected to continue to be regulated in the

CVAR_08783

future) in furtherance of the State's environmental policy objectives. As such, given the reasonably anticipated decline in proposed project emissions once fully constructed and operational, the proposed project is consistent with the Executive Orders' goals.

The Scoping Plan recognizes that AB 32 establishes an emissions reduction trajectory that will allow California to achieve the more stringent 2050 target: "These [greenhouse gas emission reduction] measures also put the state on a path to meet the long-term 2050 goal of reducing California's greenhouse gas emissions to 80 percent below 1990 levels. This trajectory is consistent with the reductions that are needed globally to stabilize the climate." Also, ARB's First Update "lays the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050," and many of the emission reduction strategies recommended by ARB would serve to reduce the proposed Project's post-2020 emissions level to the extent applicable by law:

1. Energy Sector: Continued improvements in California's appliance and building energy efficiency programs and initiatives, such as the State's zero net energy building goals, would serve to reduce the proposed Project's emissions level. Additionally, further additions to California's renewable resource portfolio would favorably influence the proposed Project's emissions level.
2. Transportation Sector: Anticipated deployment of improved vehicle efficiency, zero emission technologies, lower carbon fuels, and improvement of existing transportation systems all will serve to reduce the proposed Project's emissions level.
3. Water Sector: The proposed Project's emissions level will be reduced as a result of further desired enhancements to water conservation technologies.
4. Waste Management Sector: Plans to further improve recycling, reuse and reduction of solid waste will beneficially reduce the proposed Project's emissions level.

While the 2020 cap would remain in effect post-2020, the Cap-and-Trade Program is not currently scheduled to extend beyond 2020 in terms of additional GHG emissions reductions. However, ARB has expressed its intention to extend the Cap-and-Trade Program beyond 2020 in conjunction with setting a mid-term target. The "recommended action" in the First Update for the Cap-and-Trade Program is: "Develop a plan for a post-2020 Cap-and-Trade Program, including cost containment, to provide market certainty and address a mid-term emissions target." The "expected completion date" for this recommended action is 2017. In addition to CARB's First Update, in January 2015, during his inaugural address, Governor Jerry Brown expressed a commitment to achieve "three ambitious goals" that he would like to see accomplished by 2030 to reduce the State's GHG emissions:

(1) increasing the State's Renewable Portfolio Standard from 33 percent in 2020 to 50 percent in 2030; (2) cutting the petroleum use in cars and trucks in half; and (3) doubling the efficiency of existing buildings and making heating fuels cleaner. These expressions of Executive Branch policy may be manifested in adopted legislative or regulatory action through the state agencies and departments responsible for achieving the State's environmental policy objectives, particularly those relating to global climate change (Brown 2015). Further, recent studies show that the State's existing

and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40 percent below 1990 levels by 2030, and to 80 percent below 1990 levels by 2050. Even though these studies did not provide an exact regulatory and technological roadmap to achieve the 2030 and 2050 goals, they demonstrated that various combinations of policies could allow the statewide emissions level to remain very low through 2050, suggesting that the combination of new technologies and other regulations not analyzed in the studies could allow the State to meet the 2050 target (Energy and Economics (2015).

Given the proportional contribution of mobile source-related GHG emissions to the State's inventory, recent studies also show that relatively new trends, such as the increasing importance of web-based shopping, the emergence of different driving patterns by the "millennial" generation and the increasing effect of Web-based applications on transportation choices, are beginning to substantially influence transportation choices and the energy used by transportation modes. These factors have changed the direction of transportation trends in recent years, and will require the creation of new models to effectively analyze future transportation patterns and the corresponding effect on GHG emissions. For the reasons described above, the proposed Project's post-2020 emissions trajectory is expected to follow a declining trend, consistent with the 2030 and 2050 targets.

Regarding goals for 2050 under Executive Order S-3-05, at this time it is not possible to quantify the emissions savings from future regulatory measures, as they have not yet been developed; nevertheless, it can be anticipated that operation of the project would comply with whatever measures are enacted that state lawmakers decide would lead to an 80-percent reduction below 1990 levels by 2050. Note again that the project already includes several project design features that exceed regulatory requirements and reduce vehicle miles traveled.

Accordingly, taking into account the proposed project's emissions, project design features, standard measures and the progress being made by the State towards reducing emissions in key sectors such as transportation, industry, and electricity, the project furthers the State's goals of reducing greenhouse gas emissions to 1990 levels by 2020 and an 80-percent reduction below 1990 levels by 2050, and does not obstruct their attainment.

Summary

The project is consistent with all applicable Scoping Plan goals and policies as evaluated herein. Additionally, the project incorporates a number of project design features and mitigation measures that go beyond the Scoping Plan requirements that would further minimize GHG emissions. The project promotes the goals of the Scoping Plan through implementation of the design measures that reduce energy consumption, and water consumption. In addition, the project is required to comply with the regulations described in this section that have been adopted to implement the Scoping Plan and to achieve the AB 32 2020 target. Therefore, the project does not conflict with any plans to reduce GHG emissions and furthers the State's goals relative to this impact. The impact is less than significant.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation

Less than significant impact.

SECTION 8: RESIDENTIAL ALTERNATIVE ANALYSIS

8.1 - Description

The Residential Alternative would involve the development of a new residential neighborhood based on a specific plan, similar to nearby existing and planned (e.g. Sunny-Cal Specific Plan) residential neighborhoods of this size. The specific plan would be composed of various planning areas with defined uses and developments densities. Development of the Residential Alternative would result in a total of 792 new residential units, including 499 at 8-14 dwelling units/acre, 254 at 2-5 dwelling units per acre, and 40 at 1 dwelling unit per acre. The gross density for the overall project site would be 3.2 dwelling units per acre.

According to the Southern California Association of Governments (SCAG), unincorporated areas within the County of Riverside have an average of 3.19 persons per household. Therefore, the 792 housing units under the Residential Specific Plan Alternative could add an estimated 2,527 persons within the project area. The following discussion evaluates the potential air quality and greenhouse gas impacts associated with the Residential Specific Plan Alternative as compared to impacts from the project.

8.2 - Methodology

Construction emissions were not estimated for the residential alternative because they are assumed to be similar to the proposed project's construction emissions.

Operational air pollutant and greenhouse gas emissions were estimated by CalEEMod (version 2013.2.2) using default assumptions except for the following:

- Trip generation rates from the I-10 Gateway Residential Alternative Traffic Impact Analysis prepared by Urban Crossroads (September 24, 2014); 9.52 trips per for 792 dwelling units.
- All residential units were assumed to have natural gas fireplaces (instead of wood burning, pursuant to SCAQMD regulation).
- Trip lengths for the home to work trips were changed from the default of 19.8 miles (for a rural setting) to 25.5 miles per trip, pursuant to the information in the charts below (source: U.S. Census Bureau 2015) and Table 40 below.

Jobs by Distance - Work Census Block to Home Census Block

	2011	
	Count	Share
Total Primary Jobs	5,083	100.0%
Less than 10 miles	2,175	42.8%
10 to 24 miles	1,149	22.6%
25 to 50 miles	870	17.1%
Greater than 50 miles	889	17.5%

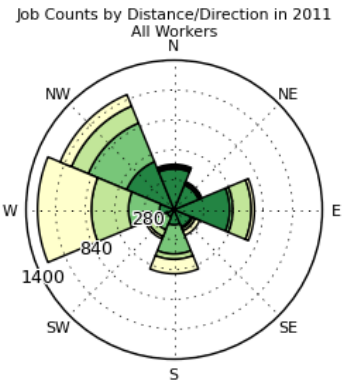

Table 40: Residential Alternative Home to Work Trip Lengths

Distance	Assumed Distance (miles)	Share (%)	Weighted Average (miles)
Less than 10 miles	5	42.8	2.1
10 to 24 miles	17	22.6	3.8
25 to 50 miles	38	17.1	6.5
Greater than 50 miles	75	17.5	13.1
Total			**25.5**

Source of Share: U.S. Census Bureau 2015.
Source of Assumed Distance: the mid-point of the range; the range greater than 50 miles is the approximate distance to Los Angeles from the project.
Source of Weighted Average: distance multiplied by the share divided by 100.

Operational Emissions Results

The operational air pollutant emissions for the residential alternative are shown in Table 41. As shown in the table, the project would have comparable ROG and SOx emissions as compared with the residential alternative. Both scenarios would have significant ROG emissions. The project would have greater NOx emissions than the alternative; however, both scenarios would have significant NOx emissions. The project would have fewer CO, PM_{10}, and $PM_{2.5}$ emissions; however, both scenarios would be less than significant. The project would have fewer PM_{10} emissions because most of the alternative's PM_{10} emissions are from paved road dust; the alternative would have more vehicle miles traveled compared with the project. NOx is an ozone precursor. Ozone, PM_{10}, and $PM_{2.5}$ are non-attainment pollutants in the South Coast Air Basin. Although the project would have greater NOx emissions, it would also have fewer PM_{10} and $PM_{2.5}$ emissions. A comparison of the project and the residential alternative indicate that impacts would be similar.

Table 41: Residential Alternative Air Pollutant Operational Emissions

Source	Emissions (pounds per day)					
	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Mobile	32.6	120.1	474.7	1.3	91.4	25.6
Area	34.9	0.8	66.1	0.0	1.4	1.4
Energy	0.8	6.8	2.9	0.0	0.5	0.5
Total Alternative Emissions	**68.3**	**127.7**	**543.7**	**1.3**	**93.3**	**27.5**
Project Emissions	**75.6**	**315.3**	**301.4**	**1.5**	**18.9**	**11.1**
Net Change with Project (project minus alternative)	7.3	187.6	-242.3	0.2	-74.4	-16.4
Significance Threshold	55	55	550	150	150	55

Notes:
ROG = reactive organic gases; NO_X = nitrogen oxides; CO = carbon monoxide
SO_X = sulfur oxides; PM_{10} and $PM_{2.5}$ = particulate matter
SIG = significant impact; LTS = less than significant
Source of emissions: Appendix A: CalEEMod Output
Source of project emissions: Table 33 (mitigated summer)

CVAR_08789

Operational greenhouse gas emissions for the residential alternative are shown in Table 42. As shown in the table, the project would have approximately 16 percent greater greenhouse gas emissions as compared with the residential alternative. The project's greenhouse gas emissions are less than significant because pursuant to Mitigation Measure GHG-1, the project would be implementing at least 100 County of Riverside credits to reduce greenhouse gas emissions. The project would also be implementing onsite solar photovoltaic. It is possible that the residential alternative would also implement 100 credits, thereby reducing its level of significance. Therefore, the impact for the residential alternative could be the same as for the project.

Table 42: Residential Alternative Operational Greenhouse Gases

Source	Emissions (MTCO2e)
Mobile	17,909
Electricity	1,747
Natural gas	1,436
Hearth (natural gas fireplaces)	191
Landscaping	14
Water	361
Waste	423
Total: Residential Alternative	**22,081**
Total: Project (without construction)	**26,237**
Net increase with project	**4,156 (16%)**

MTCO2e = metric tons of carbon dioxide equivalents.

Construction
VOC Estimates during Painting
San Gorgonio Crossing

Prepared by FirstCarbon Solutions
4-Aug-16

Estimate of Area to be Painted (Exterior)

Taking the square root of the building size and mulitiplying by 4 yields the perimeter of each building.

	Area (sf)	*Building size (sf)*	*Buildings*	*Building perimeter (feet)*	*Height of building (feet)*	*Area painted per building (sf)*	*Number of coats*	*Area to be painted (sf)*
Building 1	737,480	737,480	1	3,435	47	161,448	2	322,896
Building 2	1,123,280	1,123,280	1	4,239	47	199,252	2	398,503
							Total	721,399

Estimate of Area to be Painted (Interior)

It is assumed that the warehouse interiors would be painted any offices (if any). Each building was assumed to have 15,000 square feet of office. CalEEMod assumes the total surface painting equals 2 times the square footage, which is used here to determine the interior area to be painted. it is also assumed that 2 coats of point will be used

	Buildings	*Office area per building (sf)*	*Area to be painted (sf)*
Building 1	1	15,000	60,000
Building 2	1	15,000	60,000
		Subtotal	120,000

Total Area to be Painted	Exterior	Interior	Total
Building 1	322,896	60,000	382,896
Building 2	398,503	60,000	458,503
Total	721,399	120,000	841,399

VOC Emissions Estimates

VOC emissions are estimated separately using the methodology in the CalEEMod manual:
E = EF x F • A
Where:
E = emissions (pounds VOC)
EF = emission factor (pounds per square feet) = VOC content (g/L) / 454 (g/lb) x 3.785(L/Gal) / 180(square feet)
A = building surface area (square feet)
F = fraction of surface area; 75% for exterior and 25% for interior

EF (assume 250 grams/Liter) 0.012 pounds/sq-ft

Interior Fraction of surface area = 0.25

	Area to be painted (sf)	*Emissions (lbs VOC)*	*Days of Painting*	*Emissions (lbs/day)*
Building 1	60,000	180	10	18.0
Building 2	60,000	180	10	18.0

Exterior Fraction of surface area = 0.75

	Area to be painted (sf)	*Emissions (lbs VOC)*	*Days of Painting*	*Emissions (lbs/day)*
Building 1	322,896	2,906	60	48.4
Building 2	398,503	3,587	60	59.8

Total Emissions

	Unmitigated (lbs/day)
Building 1	66.4
Building 2	77.8
	144.2

VOC Emissions (mitigated, 100 grams/Liter paints)

EF (assume 100 grams/Liter) 0.005 pounds/sq-ft

Interior Fraction of surface area = 0.25

	Area to be painted (sf)	*Emissions (lbs VOC)*	*Days of Painting*	*Emissions (lbs/day)*
Building 1	60,000	75	10	7.5
Building 2	60,000	75	10	7.5

Exterior Fraction of surface area = 0.75

	Area to be painted (sf)	*Emissions (lbs VOC)*	*Days of Painting*	*Emissions (lbs/day)*
Building 1	322,896	1,211	60	20.2
Building 2	398,503	1,494	60	24.9

Total Emissions

	Mitigated
Building 1	27.7
Building 2	32.4
Total	60.1

Days of painting for the interior offices assume that each building would take 10 days to paint.
Days of painting for the exterior assumes each building would take 60 days to paint.

Total ROG Emissions - Unmitigated

Architectural Coating:	144.2	lbs/day
Air Compressors:	2.2	lbs/day
Total	146.4	lbs/day

Total ROG Emissions - Mitigated

Architectural Coating	60.1	lbs/day
Air Compressors	0.4	lbs/day
Total ROG Emissions	60.5	lbs/day

San Gorgonio Crossing Heavy Duty Trucks - 2017

South Coast Air Basin, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	1,860.76	1000sqft	42.72	1,860,760.00	0
Parking Lot	1,237.00	Space	11.13	494,800.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - San Gorgonio Project Description

Construction Phase - OPerations only for heavy duty trucks

Off-road Equipment - Operation only for heavy duty trucks

Trips and VMT - HDT operations ONLY

Vehicle Trips - San Gorgonio Crossing Daily truck trip rate. Considers only LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Road Dust - Paved road dust for major arterial collector (silt loading 0.035 g/m2) and LHDT1, LHDT2, MHDT, and HHDT average vehicle weight

Consumer Products - Heavy Duty Trucks Only

Area Coating - Operations only diesel truck trips

Landscape Equipment - Heavy Duty Trucks Only

Energy Use - Operations only heavy duty trucks

Water And Wastewater - Operations only - heavy duty trucks

Solid Waste - Heavy Duty Trucks Only

Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Land use taken from project description

Construction Phase - Project HDT operations ONLY

Off-road Equipment - Project HDT operations ONLY

Vehicle Trips - Trip generation rate taken from the project traffic sudy; trip length based on guidance from the SCAQMD regaring trip lengths for warehouses

Vechicle Emission Factors - Fleet mix derived from the project traffic study; HHDT emission factors reflect MY2007 rates

Vechicle Emission Factors - Fleet mix derived from the project traffic study; HHDT emission factors reflect MY2007 rates

Vechicle Emission Factors - Fleet mix derived from the project traffic study; HHDT emission factors reflect MY2007 rates

Road Dust - Road silt loading for a major arterial collector roadway; average vehicle weight for the HDT vehicle classes

Consumer Products - Project HDT operations ONLY

Area Coating - Project HDT operations ONLY

Landscape Equipment - Project HDT operations ONLY

Energy Use - Project HDT operations ONLY

Water And Wastewater - Project HDT operations ONLY

Solid Waste - Project HDT operations ONLY

San Gorgonio Crossing Heavy Duty Trucks - 2017

South Coast Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	1,860.76	1000sqft	42.72	1,860,760.00	0
Parking Lot	1,237.00	Space	11.13	494,800.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - San Gorgonio Project Description

Construction Phase - OPerations only for heavy duty trucks

Off-road Equipment - Operation only for heavy duty trucks

Trips and VMT - HDT operations ONLY

Vehicle Trips - San Gorgonio Crossing Daily truck trip rate. Considers only LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Road Dust - Paved road dust for major arterial collector (silt loading 0.035 g/m2) and LHDT1, LHDT2, MHDT, and HHDT average vehicle weight

Consumer Products - Heavy Duty Trucks Only

Area Coating - Operations only diesel truck trips

Landscape Equipment - Heavy Duty Trucks Only

Energy Use - Operations only heavy duty trucks

Water And Wastewater - Operations only - heavy duty trucks

Solid Waste - Heavy Duty Trucks Only

San Gorgonio Crossing - HDT Vehicle Classes with Mitigation - 2017

South Coast Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	1,860.76	1000sqft	42.72	1,860,760.00	0
Parking Lot	1,237.00	Space	11.13	494,800.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Land use taken from project description

Construction Phase - Project HDT operations ONLY

Off-road Equipment - Project HDT operations ONLY

Vehicle Trips - Trip generation rate taken from the project traffic sudy; trip length based on guidance from the SCAQMD regaring trip lengths for warehouses

Vechicle Emission Factors - Fleet mix derived from the project traffic study; HHDT emission factors reflect MY2007 rates

Vechicle Emission Factors - Fleet mix derived from the project traffic study; HHDT emission factors reflect MY2007 rates

Vechicle Emission Factors - Fleet mix derived from the project traffic study; HHDT emission factors reflect MY2007 rates

Road Dust - Road silt loading for a major arterial collector roadway; average vehicle weight for the HDT vehicle classes

Consumer Products - Project HDT operations ONLY

Area Coating - Project HDT operations ONLY

Landscape Equipment - Project HDT operations ONLY

Energy Use - Project HDT operations ONLY

Water And Wastewater - Project HDT operations ONLY

Solid Waste - Project HDT operations ONLY

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - San Gorgonio Project Description

Construction Phase - OPerations only for heavy duty trucks

Off-road Equipment - Operation only for heavy duty trucks

Trips and VMT - HDT operations ONLY

Vehicle Trips - San Gorgonio Crossing Daily truck trip rate. Considers only LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Vechicle Emission Factors - Fleet mix for LHDT1, LHDT2, MHDT, and HHDT

Road Dust - Paved road dust for major arterial collector (silt loading 0.035 g/m2) and LHDT1, LHDT2, MHDT, and HHDT average vehicle weight

Consumer Products - Heavy Duty Trucks Only

Area Coating - Operations only diesel truck trips

Landscape Equipment - Heavy Duty Trucks Only

Energy Use - Operations only heavy duty trucks

Water And Wastewater - Operations only - heavy duty trucks

Solid Waste - Heavy Duty Trucks Only

Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Description

Construction Phase - Operations only.

Off-road Equipment - Operations only

Trips and VMT - OPerations Only

Architectural Coating -

Vehicle Trips - Passenger cars only as per the traffic study

Vechicle Emission Factors - Passenger Vehicles only

Vechicle Emission Factors - Passenger Vehicles only

Vechicle Emission Factors - Passenger Vehicles only

Road Dust - Gasoline vehicles along a arterial collector road; silt loading = 0.035 g/m2

Consumer Products -

Area Coating - See separate architectural coating worksheet for building square footage

Energy Use - Project electrical report - RPM Engineers, Inc. See accompanying electrical consumption worksheet.

Water And Wastewater - Water Report from Jurupa Valley Water District Water Supply Study - 10/2013 scaled to the project land use building square footage

Solid Waste - CalRecycle Waste Characterization - Industrial Sector: Estimated Solid Waste Generation Rates. Website: http://www.calrecycle.ca.gov/WasteChar/WasteGenRates/Industrial.htm

Land Use Change -

Area Mitigation - MItigation Measure MM AQ-3

Energy Mitigation - Solar commitment by the project: 23% of electrical requirements.

Water Mitigation -

Waste Mitigation -

Operational Off-Road Equipment - Number if equipment as per SCAQMD recommendations: 3.6 trucks/million sqyare feet

San Gorgonio Crossing Gas Vehicles + Area + Energy + Water - 2017

South Coast Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	1,860.76	1000sqft	42.72	1,860,760.00	0
Parking Lot	1,237.00	Space	11.13	494,800.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Description

Construction Phase - Operations only.

Off-road Equipment - Operations only

Trips and VMT - OPerations Only

Architectural Coating -

Vehicle Trips - Passenger cars only as per the traffic study

Vechicle Emission Factors - Passenger Vehicles only

Vechicle Emission Factors - Passenger Vehicles only

Vechicle Emission Factors - Passenger Vehicles only

Road Dust - Gasoline vehicles along a arterial collector road; silt loading = 0.035 g/m2

Consumer Products -

Area Coating - See separate architectural coating worksheet for building square footage

Energy Use - Project electrical report - RPM Engineers, Inc. See accompanying electrical consumption worksheet.

Water And Wastewater - Water Report from Jurupa Valley Water District Water Supply Study - 10/2013 scaled to the project land use building square footage

Solid Waste - CalRecycle Waste Characterization - Industrial Sector: Estimated Solid Waste Generation Rates. Website: http://www.calrecycle.ca.gov/WasteChar/WasteGenRates/Industrial.htm

Land Use Change -

Area Mitigation - MItigation Measure MM AQ-3

Energy Mitigation - Solar commitment by the project: 23% of electrical requirements.

Water Mitigation -

Waste Mitigation -

Operational Off-Road Equipment - Number if equipment as per SCAQMD recommendations: 3.6 trucks/million sqyare feet

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Description

Construction Phase - Operations only.

Off-road Equipment - Operations only

Trips and VMT - OPerations Only

Architectural Coating -

Vehicle Trips - Passenger cars only as per the traffic study

Vechicle Emission Factors - Passenger Vehicles only

Vechicle Emission Factors - Passenger Vehicles only

Vechicle Emission Factors - Passenger Vehicles only

Road Dust - Gasoline vehicles along a arterial collector road; silt loading = 0.035 g/m2

Consumer Products -

Area Coating - See separate architectural coating worksheet for building square footage

Energy Use - Project electrical report - RPM Engineers, Inc. See accompanying electrical consumption worksheet.

Water And Wastewater - Water Report from Jurupa Valley Water District Water Supply Study - 10/2013 scaled to the project land use building square footage

Solid Waste - CalRecycle Waste Characterization - Industrial Sector: Estimated Solid Waste Generation Rates. Website: http://www.calrecycle.ca.gov/WasteChar/WasteGenRates/Industrial.htm

Land Use Change -

Area Mitigation - MItigation Measure MM AQ-3

Energy Mitigation - Solar commitment by the project: 23% of electrical requirements.

Water Mitigation -

Waste Mitigation -

Operational Off-Road Equipment - Number if equipment as per SCAQMD recommendations: 3.6 trucks/million sqyare feet

San Gorgonio Crossing Project **2017** REV3
Emission Assumptions **Max Hourly CO** Emissions

Emission Factors

1) Vehicle Emissions

a) Truck and Auto Traffic
(1) EMFAC2011
(a) Calculations for SoCAB
(b) Truck Mix
Traffic Impact Study used to derive fleet mix
EMFAC2011 to derive the % of diesel truck vehicles
(d) Vehicle Travel Speed
Onsite Travel 15 mph
Offsite Travel 35 mph
(e) Truck Idle time: 15 minutes (truck idling only applies to LHDT1, LHDT2, MHDT, and HHDT diesel vehicles)
(f) Emission factors for Max Hourly CO emissions
(g) Emissions calculated for 2017

Traffic Allocation

1) Traffic was allocated to each building as a function of building size (square footage), number of loading docks, and driveway
2) Trip generation from the traffic study - Urban Crossroads 2013
3) Onsite travel emssions generated from diesel vehicles at all buildings
4) Onsite idling emissions generated only for diesel trucks

Emission Source Configuration

1) Vehicle traffic represented by a line source
2) Onsite idling represented as a point source

Onsite Travel Links

Diesel Vehicles	**Travel Distance (m)**
Building 1 West - (Enter/Exit Street 2)	999
Building 1 West - Enter Street 2/Exit Drwy 1)	1318

LHDT1 and LHDT2 idling emissions calculated by muiltiplying the running exhast emission factor at 5 mph by 5 mph

San Gordonio Crossing Project **2017** REV3
Emission Assumptions **Max Hourly Nox** Emissions

Emission Factors

1) Vehicle Emissions

a) Truck and Auto Traffic
(1) EMFAC2011
(a) Calculations for SoCAB
(b) Truck Mix
Traffic Impact Study used to derive fleet mix
EMFAC2011 to derive the % of diesel truck vehicles
(d) Vehicle Travel Speed
Onsite Travel 15 mph
Offsite Travel 35 mph
(e) Truck Idle time: 15 minutes (truck idling only applies to LHDT1, LHDT2, MHDT, and HHDT diesel vehicles)
(f) Emission factors for Max Hourly Nox emissions
(g) Emissions calculated for 2017

Traffic Allocation

1) Traffic was allocated to each building as a function of building size (square footage), number of loading docks, and driveway
2) Trip generation from the traffic study - Urban Crossroads 2013
3) Onsite travel emssions generated from diesel vehicles at all buildings
4) Onsite idling emissions generated only for diesel trucks

Emission Source Configuration

1) Vehicle traffic represented by a line source
2) Onsite idling represented as a point source

Onsite Travel Links

Diesel Vehicles	**Travel Distance (m)**
Building 1 West - (Enter/Exit Street 2)	999
Building 1 West - Enter Street 2/Exit Drwy 1)	1318

LHDT1 and LHDT2 idling emissions calculated by muiltiplying the running exhast emission factor at 5 mph by 5 mph

San Gorgonio Crossing Project **2017** REV3
Emission Assumptions **Annual Nox** Emissions

Emission Factors

1) Vehicle Emissions

a) Truck and Auto Traffic
(1) EMFAC2011
(a) Calculations for SoCAB
(b) Truck Mix
Traffic Impact Study used to derive fleet mix
EMFAC2011 to derive the % of diesel truck vehicles
(d) Vehicle Travel Speed
Onsite Travel 15 mph
Offsite Travel 35 mph
(e) Truck Idle time: 15 minutes (truck idling only applies to LHDT1, LHDT2, MHDT, and HHDT diesel vehicles)
(f) Emission factors for Annual Nox emissions
(g) Emissions calculated for 2017

Traffic Allocation

1) Traffic was allocated to each building as a function of building size (square footage), number of loading docks, and driveway
2) Trip generation from the traffic study - Urban Crossroads 2013
3) Onsite travel emssions generated from diesel vehicles at all buildings
4) Onsite idling emissions generated only for diesel trucks

Emission Source Configuration

1) Vehicle traffic represented by a line source
2) Onsite idling represented as a point source

Onsite Travel Links

Diesel Vehicles	**Travel Distance (m)**

LHDT1 and LHDT2 idling emissions calculated by muiltiplying the running exhast emission factor at 5 mph by 5 mph

San Gorgonio Crossing **2017** REV3
Emission Assumptions **PM10** Emissions

Emission Factors

1) Vehicle Emissions

a) Truck and Auto Traffic
(1) EMFAC2011
(a) Calculations for SoCAB
(b) Truck Mix
Traffic Impact Study used to derive fleet mix
EMFAC2011 to derive the % of diesel truck vehicles
(d) Vehicle Travel Speed
Onsite Travel 15 mph
Offsite Travel 35 mph
(e) Truck Idle time: 15 minutes (truck idling only applies to LHDT1, LHDT2, MHDT, and HHDT diesel vehicles)
(f) Emission factors for PM10 emissions
(g) Emissions calculated for 2017

Traffic Allocation

1) Traffic was allocated to each building as a function of building size (square footage), number of loading docks, and driveway
2) Trip generation from the traffic study - Urban Crossroads 2013
3) Onsite travel emssions generated from diesel vehicles at all buildings
4) Onsite idling emissions generated only for diesel trucks

Emission Source Configuration

1) Vehicle traffic represented by a line source
2) Onsite idling represented as a point source

Onsite Travel Links

Idling Emissions

Vehicle Class	Emission Factor (g/hr)
LHDT1-DSL	0.478
LHDT2-DSL	0.483
MHDT-DSL	0.235
HHDT-DSL	0.125

LHDT1 and LHDT2 idling emissions calculated by muiltiplying the running exhast emission factor at 5 mph by 5 mph

San Gorgonio Crossing Project **2017** REV3
Emission Assumptions **PM2.5** Emissions

Emission Factors

1) Vehicle Emissions

a) Truck and Auto Traffic
(1) EMFAC2011
(a) Calculations for SoCAB
(b) Truck Mix
Traffic Impact Study used to derive fleet mix
EMFAC2011 to derive the % of diesel truck vehicles
(d) Vehicle Travel Speed
Onsite Travel 15 mph
Offsite Travel 35 mph
(e) Truck Idle time: 15 minutes (truck idling only applies to LHDT1, LHDT2, MHDT, and HHDT diesel vehicles)
(f) Emission factors for PM2.5 emissions
(g) Emissions calculated for 2017

Traffic Allocation

1) Traffic was allocated to each building as a function of building size (square footage), number of loading docks, and driveway
2) Trip generation from the traffic study - Urban Crossroads 2013
3) Onsite travel emssions generated from diesel vehicles at all buildings
4) Onsite idling emissions generated only for diesel trucks

Emission Source Configuration

1) Vehicle traffic represented by a line source
2) Onsite idling represented as a point source

Onsite Travel Links

Diesel Vehicles	Travel Distance (m)
Building 1 West - (Enter/Exit Street 2)	999
Building 1 West - Enter Street 2/Exit Drwy 1)	1318

OEHHA Cancer Risk Methodology

Cancer Risk = DPM x CPF x ASF x DBR x ED x EF x TAH / AT

Cancer Risk = probability of an individual contracting cancer out of a population of 1 million people over a lifetime exposure duration of 30 years

DPM = long-term average concentration of diesel PM as predicted by the air dispersion model (ug/m3)

CPF = cancer potency factor for DPM

ASF = age sensitivity factors that are dependent on the age of the exposed individual

DBR = daily breathing rates that are dependent on the age of the exposed individual (liters/kg-day)

ED = exposure duration (years)

EF = exposure frequency (days/year)

TAH = time at home factors that are dependent on the age of the exposed individual (%)

AT = averaging time over the lifetime of an individual

WAF = worker adjustment factor

Cancer Risk Equation Values as recommended by the California Office of Environmental Health Hazards Assessment and SCAQMD via MATES

Sensitive Receptors

CPF	1.1	
Exposure Frequency	350	days
Averaging Time	25550	days

ASF, DBR, TAH Age Factors

Age Group	ASF	90th %/80-DBR	TAH
3rd Trimester	10	333	1
0-2 years	10	934	1
3-16 years	3	572	1
>16 years	1	261	0.73

School Receptors

CPF	1.1	
Exposure Duration	9	years
Averaging Time	25550	days
Daily Breathing Rate	520	liters/kg-day
Exposure Frequency	180	days/year
Age Factor	3	
TAH	1	

Worker Receptors

CPF	1.1	
Exposure Duration	25	years
Averaging Time	25550	days
Daily Breathing Rate	230	liters/kg-day
Exposure Frequency	250	days/year
Age Factor	1	
TAH	1	
Worker Adjustment Factor	1	assumes the project operates 24/7

OEHHA Cancer Risk Methodology

Cancer Risk = DPM x CPF x ASF x DBR x ED x EF x TAH / AT

Cancer Risk = probability of an individual contracting cancer out of a population of 1 million people over a lifetime exposure duration of 30 years

DPM = long-term average concentration of diesel PM as predicted by the air dispersion model (ug/m3)

CPF = cancer potency factor for DPM

ASF = age sensitivity factors that are dependent on the age of the exposed individual

DBR = daily breathing rates that are dependent on the age of the exposed individual (liters/kg-day)

ED = exposure duration (years)

EF = exposure frequency (days/year)

TAH = time at home factors that are dependent on the age of the exposed individual (%)

AT = averaging time over the lifetime of an individual

WAF = worker adjustment factor

Cancer Risk Equation Values as recommended by the California Office of Environmental Health Hazards Assessment and SCAQMD via MATES

Sensitive Receptors

CPF	1.1	
Exposure Frequency	350	days
Averaging Time	25550	days

ASF, DBR, TAH Age Factors

Age Group	ASF	90th %/80-DBR	TAH
3rd Trimester	10	333	1
0-2 years	10	934	1
3-16 years	3	572	1
>16 years	1	261	0.73

School Receptors

CPF	1.1	
Exposure Duration	9	years
Averaging Time	25550	days
Daily Breathing Rate	520	liters/kg-day
Exposure Frequency	180	days/year
Age Factor	3	
TAH	1	

Worker Receptors

CPF	1.1	
Exposure Duration	25	years
Averaging Time	25550	days
Daily Breathing Rate	230	liters/kg-day
Exposure Frequency	250	days/year
Age Factor	1	
TAH	1	
Worker Adjustment Factor	1	assumes the project operates 24/7

B.2 - Alternatives CalEEMod Output

SGC No Project - General Plan Build Alternative

Riverside-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	216.00	Dwelling Unit	155.00	388,800.00	618

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Development of 216 single family units

Vehicle Trips - Trip rates from Urban Crossroads Trip Generation Evalutation

Woodstoves - Comply with Rule 445

Construction Off-road Equipment Mitigation - Comply with rule 403 and use Tier 4 engines

Residential Alternative

Riverside-South Coast County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Low Rise	240.00	Dwelling Unit	15.00	240,000.00	686
Condo/Townhouse	221.00	Dwelling Unit	13.81	221,000.00	632
Single Family Housing	331.00	Dwelling Unit	107.47	595,800.00	947

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Residential Alternative: 331 single-family homes, 240 apartments and 221 townhomes

Vehicle Trips - Trip rates from Urban Crossroads Trip Generation Evalutation

Woodstoves - Comply with Rule 445

Construction Off-road Equipment Mitigation - comply with rule 403, use Tier 4 engines

Residential Alternative

Riverside-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Low Rise	240.00	Dwelling Unit	15.00	240,000.00	686
Condo/Townhouse	221.00	Dwelling Unit	13.81	221,000.00	632
Single Family Housing	331.00	Dwelling Unit	107.47	595,800.00	947

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Residential Alternative: 331 single-family homes, 240 apartments and 221 townhomes

Vehicle Trips - Trip rates from Urban Crossroads Trip Generation Evalutation

Woodstoves - Comply with Rule 445

Construction Off-road Equipment Mitigation - comply with rule 403, use Tier 4 engines

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.4	**Precipitation Freq (Days)**	28
Climate Zone	10			**Operational Year**	2017
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	630.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Redused Industrial Intensity Alternative: 2 buildings totaling 1,328,961 square feet, 655 auto parking, and 659 trailer parking

Architectural Coating - use AQMD recommended low VOC arch coatings

Vehicle Trips - Trip rates from Urban Crossroads Trip Generation Evalutation

Vechicle Emission Factors - based off traffic study

Vechicle Emission Factors - based off traffic study

Vechicle Emission Factors - based off traffic study

Woodstoves -

Construction Off-road Equipment Mitigation - comply with rule 403

EXECUTIVE SUMMARY

The approximately 229-acre San Gorgonio Crossings property is located east of Interstate 10 (I-10) on the north side of Cherry Valley Boulevard in the northwestern portion of Riverside County, California. The property is situated on the U.S. Geological Survey (USGS) 7.5-minute El Casco quadrangle in the northern portion of Section 30, Township 2 South, Range 1 West.

The project site supports 8 vegetation communities/habitats: mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral (including disturbed), exotic habitat (eucalyptus woodland), non-native grassland, and disturbed habitat. Developed areas along Cherry Valley Boulevard occur within off-site impact areas.

The San Gorgonio Crossings site is within the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Narrow Endemic Plant Species Survey Area (NEPSSA) for 2 plant species: Yucaipa (Marvin's) onion (*Allium marvinii*) and many-stemmed dudleya (*Dudleya multicaulis*). Rare plant surveys were performed for these species. Yucaipa onion was observed in the northeast corner of the property. The population is being 100 percent avoided.

No threatened or endangered animal species were observed on the San Gorgonio Crossings site. No burrowing owls (*Athene cunicularia*) or burrowing owl sign were observed during the required focused survey. Three MSHCP covered species were observed/detected on the San Gorgonio Crossings property: orange-throated whiptail (*Cnemidophorus hyperythrus beldingi*), northern harrier (*Circus cyaneus*), and Bell's sage sparrow (*Amphispiza belli belli*).

Significant impacts to sensitive vegetation communities—including mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral (including disturbed), and non-native grassland—would occur.

Impacts to U.S. Army Corps of Engineers (USACE) and California Department of Fish and Wildlife (CDFW) jurisdictional areas would be considered significant under the California Environmental Quality Act (CEQA). A total of 0.40 acre of USACE and 1.11 acres of CDFW jurisdictional areas would be impacted on the San Gorgonio Crossings project site. These impacts would require a 404 Permit from the USACE, Certification from the Regional Water Quality Control Board (RWQCB) under Section 401 of the Clean Water Act, and a CDFW Streambed Alteration Agreement.

Implementation of the proposed project would directly impact raptor foraging habitat. There is also the potential to directly or indirectly impact raptor nests during construction. Direct impacts to an active raptor nest are not allowed under the federal Migratory Bird Treaty Act (MBTA).

Indirect impacts consist of secondary effects of the project, including noise, decreased water quality (e.g., through sedimentation, urban contaminants, or fuel release), fugitive dust, colonization of non-native plant species, animal behavioral changes, and night lighting.

The project would be consistent with the MSHCP based on the following:

- The project lies outside of any MSHCP Criteria Cells, and as a result. no on-site conservation is required.

- The project is consistent with MSHCP Section 6.1.2 because no vernal pools occur within the proposed project footprint, and the impacts to Riparian/Riverine resources would be adequately mitigated.

- The project is consistent with MSHCP Section 6.1.3 because NEPSSA species are not expected to occur on site and were not observed during focused surveys.

- The project is consistent with MSHCP Section 6.1.4 because the project is not located adjacent to the MSHCP preserve and, therefore, no adjacency guidelines are required.

- The project is consistent with MSHCP Section 6.3.2 because no burrowing owls or active burrow locations were observed on the property during the focused surveys.

Impacts to upland habitats and associated species will be addressed through participation in the MSHCP, and payment of the MSHCP Local Development Mitigation fee of $6,597 per acre.

Impacts to vegetation communities, sensitive animal species, and potentially to sensitive plant species will be mitigated to below a level of significance through payment of the MSHCP fee. Impacts to USACE and CDFW jurisdictional habitats along with impacts to MSHCP Riverine areas shall be mitigated to below a level of significance by on-site creation or restoration at a 2:1 ratio. Indirect impacts associated with water quality shall be mitigated to below a level of significance through compliance with National Pollutant Discharge Elimination System (NPDES) requirements.

1.0 INTRODUCTION

This report provides the County of Riverside (County; California Environmental Quality Act [CEQA] lead agency), resource agencies, and the public with current biological data to satisfy the review of the proposed San Gorgonio Crossings project under CEQA and other federal, state, and local regulations. The report describes sensitive biological resources (including vegetation communities, plants, and animals detected on the project site) and potential direct and indirect project impacts, as well as proposes mitigation measures to offset those impacts. Consistency with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP; Dudek and Associates [Dudek] 2003) will be addressed.

1.1 PROJECT LOCATION AND DESCRIPTION

The approximately 229-acre San Gorgonio Crossings property is located east of Interstate 10 (I-10) on the north side of Cherry Valley Boulevard in the northwestern portion of Riverside County, California (Figures 1 and 2). The property is situated on the U.S. Geological Survey (USGS) 7.5-minute El Casco quadrangle in the northern portion of Section 30, Township 2 South, Range 1 West (Figure 3).

The project proposes the construction of 2 large industrial buildings and associated infrastructure on approximately 145.6 acres of the 229.9-acre property. The project includes detention basins, parking, landscaping, and other associated infrastructure. The 2 industrial buildings will be designed to be eligible for Leadership in Energy and Environmental Design (LEED) Silver Certification. Building 1 will comprise approximately 811,000 square feet and Building 2 approximately 1,012,760 square feet, for a total of approximately 1,823,760 square feet of floor area. Additionally, the project includes the use of solar panels on roofs, with 23 percent of the project's power needs being provided by the on-site solar panels.

Existing drainage flows from off-site areas to the north would be conveyed through the site and would ultimately be conveyed off site to the west side of the project site. As included in the Hydrology analysis for Tentative Parcel Map 36564, there are 2 drainage areas that exist on site – Drainage area "A" and "B." The project includes a number of drainage facilities designed to safely convey the off-site 100-year storm runoffs through the project site; limit the storm flow resulting from project activities including the use of bio-treatment best management practices (BMPs) such as extended detention basins and trenches sized to accommodate the first flush flows generated in the proposed development area; storm drain facilities that will collect and route on-site runoff through a detention basin that is sized to limit 10-year storm discharge from the site to be equal or less than flows under the existing condition; and a detention basin that will incorporate hydromodification requirements by limiting the increase in the 2-year storm flow caused by the proposed development to less than 10 percent more than existing conditions.

1.2 PHYSICAL DESCRIPTION AND LAND USE

The southern and central portions of the property consist of a broad, sloping grassland with steep ridges and canyons occurring on the northern half of the site. Grazing and past active agriculture have disturbed much of the site, which is currently grazed by sheep and goats. Several dirt roads

and trails traverse the site and extend off site to the north and east. A small horse ranch and I-10 occur to the southwest of the property, while the remains of a chicken ranch occur to the southeast. The remainder of the property is bordered by undeveloped land, with the exception of a few rural residences to the north. The northern and western portions of the property were affected by fire between 2007 and 2008. The larger scrub and trees were affected by the fire, although most remain and are recovering.

Elevations on site range from approximately 2,400 to 2,690 feet above mean sea level. Overall, site drainage is to the west and southwest. Soils on site are primarily Hanford coarse sandy loam and terrace escarpments with Gorgonio gravelly loamy fine sand, Greenfield sandy loam, Hanford cobbly coarse sandy loam, and Ramona sandy loam (Knecht 1971).

2.0 METHODS

2.1 LITERATURE REVIEW

In addition to conducting biological field surveys, HELIX Environmental Planning, Inc. (HELIX) performed a review of existing literature, and searches of the California Department of Fish and Game's (CDFW's) California Natural Diversity Data Base (CNDDB; CDFW 2012a, b, and c) and California Native Plant Society's (CNPS's) online database (2012) for information regarding sensitive species known to occur in the project vicinity.

A review of the MSHCP was made to determine the location of the proposed project site in relation to MSHCP Criteria Cells and survey criteria, as well as to determine listed or sensitive species that have potential to occur within the site.

2.2 GENERAL BIOLOGICAL SURVEY

Vegetation communities were mapped on a 1"=400' scale aerial photograph. Vegetation was classified and mapped according to the County's biological resource mapping requirements. In addition, aerial photographs were used in the field, as were Global Positioning System (GPS) units to map jurisdictional areas.

2.3 FOCUSED SURVEYS

The following focused surveys were conducted by HELIX on the San Gorgonio Crossings parcel in 2005, 2007, 2008, and 2012: sensitive plants, burrowing owl (*Athene cunicularia*), Riparian/Riverine and vernal pool assessment, and jurisdictional delineation (Table 1). Plants were identified in the field or collected for later identification by comparison to photographs or keys. The investigation for amphibians and reptiles included lifting, overturning, and carefully replacing rocks and debris in locations with a high likelihood of supporting these species. Birds were identified by auditory or visual recognition with the aid of binoculars. Mammals were identified by diagnostic sign, including scat, footprints, scratch-outs, dust bowls, burrows, and trails. All plant and animal species detected during the surveys were identified and recorded.

2.3.1 Sensitive Plants

The MSHCP has designated certain areas as requiring surveys for sensitive plant(s). The property occurs within Narrow Endemic Plant Species Survey Area (NEPSSA) 8. MSHCP Section 6.1.3 acknowledges that locations of these plant species that have been highly disturbed within the past few years are considered to be of lower quality (i.e., lower potential for Narrow Endemic Species occurrence). Nonetheless, if other conditions are appropriate, these areas may have potential to support sensitive species if allowed to remain undisturbed. As a result, surveys are required where appropriate soils and habitat are present.

HELIX conducted focused surveys for NEPSSA Area 8 plants – Yucaipa (Marvin's) onion (*Allium marvinii*) and many-stemmed dudleya (*Dudleya multicaulis*) – in accordance with the requirements of the MSHCP. Surveys for Yucaipa onion and many-stemmed dudleya were conducted by HELIX biologists on May 27, 2005, which was during the flowering period of sensitive plants with potential to occur. The soil survey for the western Riverside area

(Knecht 1971) was reviewed to determine whether clay soils were mapped on site as the target plant species prefer clay soil habitats. Surveys were focused on areas of potential habitat within the site: clay soil openings in chaparral (for Yucaipa onion) and clay/cobbly soil openings within chaparral, coastal sage scrub, and grassland. Surveys were performed by systematically walking transects of the entire site.

2.3.2 Burrowing Owl

The site is within the MSHCP Burrowing Owl Survey Area. Winter season burrowing owl surveys were conducted in early 2005, and breeding season burrowing owl surveys were conducted in June 2005 (HELIX 2005), April-May 2007 (HELIX 2007), and in August 2008 (HELIX 2008; Appendix A). The 2005 surveys were conducted in accordance with CDFW field protocol (CDFW 1995); 2007 and 2008 surveys were conducted according to MSHCP Burrowing Owl Survey Guidelines (County 2006). The survey area consisted of the entire project site where potential habitat for owls existed. The biologists walked slowly and methodically along transects no farther than 30 meters apart on all potential burrowing habitat that occurs on site and closely checked areas that met basic owl habitat requirements. All burrows were inspected for indications of recent owl occupation. A 500-foot-wide buffer zone was surveyed visually where potential burrowing owl habitat bordered the property. Detailed information on the 2008 survey times, dates, and conditions are included in Appendix A.

2.3.3 Riparian/Riverine and Vernal Pool Assessment

In January and February 2005, HELIX biologists W. Larry Sward and Stacy Nigro conducted a thorough search on the San Gorgonio Crossings property for Riparian/Riverine and vernal pool habitats in accordance with MSHCP Section 6.1.2. An updated assessment was conducted by Mr. Sward on September 17, 2012. Areas were assessed to determine whether Riparian/Riverine or vernal pool habitats are present on site, consistent with Section 6.1.2 of the MSHCP. The Riparian/Riverine and vernal pool assessment was conducted according to the following MSHCP definitions:

- Riparian/Riverine areas are lands that contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or depend upon soil moisture from a nearby freshwater source; or areas with freshwater flow during all or a portion of the year; and

- Vernal pools are seasonal wetlands that occur in depression areas that have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season, while upland species (annuals) may be dominant during the drier portion of the growing season. The determination that an area exhibits vernal pool characteristics and the definition of the watershed supporting vernal pool hydrology must be made on a case-by-case basis. Such determinations should consider the length of time the area exhibits upland and wetland characteristics and the manner in which the area fits into the

overall ecological system as a wetland. Evidence concerning the persistence of an area's wetness can be obtained from its history, vegetation, soils, drainage characteristics, uses to which it has been subjected, and weather and hydrologic records.

2.3.4 Jurisdictional Delineation

Prior to beginning fieldwork, recent aerial photographs (1"=300' scale), topographic maps (1"=300' scale), and USGS topographical maps were reviewed to determine the location of potential jurisdictional areas that may be affected by the project. Data were collected in areas that were suspected to be jurisdictional habitats on January 27 and February 8, 2005 by Mr. Sward and Ms. Nigro (HELIX 2009a). This delineation was updated in 2009 based on a 2008 site visit with U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board (RWQCB) personnel and subsequent field work in November 2008 (HELIX 2009a). An updated assessment was conducted by Mr. Sward on September 17, 2012.

USACE wetland boundaries were determined using the 3 criteria (vegetation, hydrology, and soils) established for wetland delineations as described within the Wetlands Delineation Manual (Environmental Laboratory 1987) and Arid West Regional Supplement (USACE 2006).

The jurisdictional results are also consistent with recent court decisions (i.e., Rapanos v. United States, *Carabell v. United States*, and *Solid Waste Agency of Northern Cook County [SWANCC] v. USACE*) as outlined and applied by the USACE (2007; Fabricant and Morello 2003; Grumbles and Woodley 2007), USACE and U.S. Environmental Protection Agency (EPA; 2007), and EPA and USACE (2007). These publications explain that the EPA and USACE will assert jurisdiction over traditional navigable waters (TNWs) and tributaries to TNWs that are a relatively permanent water body (RPW). An RPW has year-round or continuous seasonal flow. For water bodies that are not RPWs, a significant nexus evaluation must be conducted to determine whether the non-RPW is jurisdictional. An overview of USACE wetlands and jurisdictional Waters of the U.S. (WUS) definitions is presented in Appendix B.

Plants were identified according to The Jepson Manual: Higher Plants of California (Hickman, ed. 1993). Wetland affiliations of plant species follow the U.S. Fish and Wildlife Service's (USFWS's) National List of Plant Species that Occur in Wetlands: California (Reed 1988). Soils information was taken from the Soil Survey of the Western Riverside Area, California (Knecht 1971) and Hydric Soil Lists (U.S. Department of Agriculture [USDA] 1992). Soil chromas were identified according to Munsell's Soil Color Charts (Kollmorgen 1994).

All areas with depressions, drainage channels, or wetland vegetation were evaluated for the presence of WUS, including jurisdictional wetlands. Areas were mapped as wetlands, non-wetland WUS, or uplands according to USACE policies and procedures. Areas were determined to be non-wetland WUS if there was evidence of regular surface flow (e.g., bed and bank) but vegetation or soils criterion was not met. Jurisdictional limits for these areas were defined by the ordinary high water mark (OHWM), mapped, and the surrounding vegetation noted.

CDFW jurisdictional boundaries were determined based on the presence of riparian vegetation or regular surface flow. Streambeds within CDFW jurisdiction were delineated based on the definition of streambed as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supporting fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports riparian vegetation" (Title 14, Section 1.72). Riparian habitat is not defined in Title 14, but the quoted section refers to vegetation and habitat associated with a stream. The CDFW jurisdictional habitat includes all riparian shrub or tree canopy that may extend beyond the banks of a stream.

2.4 NOMENCLATURE

Nomenclature used in this report follows the conventions used in the MSHCP. Vegetation community classifications follow the vegetation communities shown in Section 2.1.3 of the MSHCP (Dudek 2003) and Holland (1986). Latin names of plants follow Hickman, ed. (1993), while common names follow Hickman or the CNPS (2009). Sensitive plant status follows the CNDDB (CDFW 2011 and 2012). Animal nomenclature used in this report is taken from Collins and Taggert (2009) for amphibians and reptiles, the American Ornithologists' Union (2008) for birds, and Baker *et al*. (2003) for mammals. Sensitive animal status follows the CNDDB (CDFW 2009a).

2.5 SURVEY LIMITATIONS

All field surveys were conducted during the daytime, which significantly reduces the likelihood of detecting nocturnal mammals such as rodents and bobcats, and some nocturnal reptiles. No small mammal trapping or focused reptile surveys were conducted and these species tend to be under sampled.

3.0 RESULTS

3.1 VEGETATION COMMUNITIES

Eight vegetation communities are mapped on the San Gorgonio Crossings: mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral (including disturbed), exotic habitat (eucalyptus woodland), non-native grassland, and disturbed habitat (Figure 4; Table 2). Developed areas along Cherry Valley Boulevard occur within off-site impact areas.

Pasture	0	1.3
Developed	0	0.9
TOTAL	**229.87**	**13.6**

*Acre(s) are rounded to the nearest 0.1, except for acre(s) under 0.1, which are rounded to the nearest 0.01; thus, totals reflect rounding. Acreages include off-site improvement areas.

+Includes impact acreages only

3.1.1 Mule Fat Scrub

Mule fat scrub is a depauperate, shrubby riparian scrub community dominated by mule fat (*Baccharis salicifolia*) and interspersed with shrubby willows (*Salix* spp.). This habitat generally occurs along intermittent stream channels with a fairly coarse substrate and moderate depth to the water table (Holland 1986). It consists of a small (0.06 acre), isolated stand in the southeastern corner of the site.

3.1.2 Riversidean Sage Scrub

Riversidean sage scrub occupies xeric sites such as steep slopes, severely drained soils, or clays that slowly release stored soil moisture. It is dominated by sub-shrubs with leaves that are deciduous during drought, an adaptation that allows the habitat to withstand the prolonged drought period in the summer and fall. Sage scrub species have relatively shallow root systems and open canopies that allow for the occurrence of a substantial herbaceous (annual plant) component. Typical stands are fairly open and dominated by species such as coastal sagebrush (*Artemisia californica*), brittlebush (*Encelia farinosa*), and flat-topped buckwheat (*Eriogonum fasciculatum*; Holland 1986). This habitat type occurs mainly in the eastern portions of the site and is dominated by brittlebush, rosemary flat-topped buckwheat (*Eriogonum fasciculatum* ssp. *polifolium*), and coastal sagebrush. Other species present include deerweed (*Lotus scoparius*), filarees (*Erodium* spp.), black and white sage (*Salvia mellifera* and *S. apiana*), California buckwheat (*Eriogonum fasciculatum* ssp. *fasciculatum*), and non-native grasses. A total of 7.7 acres of this habitat occurs on the site, and an additional 0.1 acre occurs in the offsite impact area.

3.1.3 Riversidean-Diegan Coastal Sage Scrub (including disturbed)

This habitat type is a mix of both Riversidean and Diegan coastal sage scrubs, both of which occupy low-moisture sites and are dominated by drought-deciduous sub-shrubs (Holland 1986). This habitat type is found mainly in the central portions of the site and totals approximately 27.9 acres. It is generally taller and comprised of greater percentages of coastal sagebrush and flat-topped buckwheat than the pure Riversidean sage scrub habitat. Other species present include California encelia (*Encelia californica*), black sage, deerweed, and non-native grasses. Disturbed portions totaling approximately 10.2 acres consist of sparse shrub cover and a high percentage of non-native grasses and forbs. An additional 0.2 acre of Riversidean-Diegan coastal sage scrub occurs within the off-site impact area.

3.1.4 Coastal Sage-Chaparral Scrub (including disturbed)

Areas of shrub habitat occur on site that contain a mix of sage scrub and chaparral species. Three small pockets of this habitat type totaling 0.3 acre occur in the northern portion of the site and consist of chamise (*Adenostoma fasciculatum*), coastal sagebrush, black sage, and various grasses. A 0.2-acre patch of disturbed coastal sage-chaparral scrub occurs in the north-central portion of the property.

3.1.5 Scrub Oak Chaparral (including disturbed)

Scrub oak chaparral is a dense evergreen chaparral that can grow to 20 feet tall. It is dominated by scrub oak (*Quercus berberidifolia*) at this location. Most of the scrub oak chaparral on site is fairly open, and numerous trees exhibit stress, possibly from past drought conditions; these areas of sparse shrubs were identified as disturbed. This habitat is found on the slope adjacent to Cherry Valley Boulevard and other slopes throughout the site. Approximately 2.9 acres of scrub oak chaparral and 9.8 acres of disturbed scrub oak chaparral occur on the site. Species occurring include scrub oak, spiny redberry (*Rhamnus crocea*), sugar bush (*Rhus ovata*), miner's lettuce (*Claytonia perfoliata*), fiesta flower (*Pholistoma racemosum*), black sage, American bowlesia (*Bowlesia incana*), and wild cucumber (*Marah macrocarpa*).

3.1.6 Non-native Grassland

Non-native grassland contains annual grasses of varying cover and is often associated with showy-flowered, native annual forbs. This association occurs on gradual slopes with deep, fine-textured, usually clay soils (Holland 1986). This is the dominant habitat type on site and in the off-site grading areas, totaling 174.1 acres. Species present include ripgut grass (*Bromus diandrus*), foxtail chess (*B. madritensis* ssp. *rubens*), Mediterranean grass (*Schismus barbatus*), rancher's fiddleneck (*Amsinckia intermedia*), horehound (*Marrubium vulgare*), and filaree. An additional 9.6 acres of non-native grassland occurs within the off-site impact area.

3.1.7 Exotic Habitat (Eucalyptus Woodland)

Eucalyptus woodlands were first established in California in the late 1800s and have since been planted extensively for wind blocks, ornamentals, and hardwood production. Most groves are

monotypic, with the most common species being either blue gum (*Eucalyptus globulus*) or red gum (*E. globulus*) eucalyptus. The understory within well-established groves is usually very sparse due to the closed canopy and allelopathic nature of the leaf litter. As a wildlife habitat, these woodlands provide excellent nesting sites for a variety of raptors, including golden eagles. During winter migrations, a large variety of warblers may be found feeding on the insects attracted to eucalyptus flowers. The sparse understory offers only limited wildlife habitats. This habitat occurs on site as 2 stands in the northwestern portion of the property and totals approximately 0.6 acre.

3.1.8 Disturbed Habitat

Disturbed habitat includes unvegetated or sparsely vegetated areas, particularly where the soil has been heavily compacted by either vehicles (roads) or prior development, or where agricultural lands have been abandoned. Disturbed habitat is generally dominated by non-native weedy species that adapt to frequent disturbance or consists of dirt trails and roads, as is the case on site. Disturbed habitat on site totals approximately 6.3 acres. An additional 1.4 acre of disturbed habitat occurs within the off-site impact area.

3.1.9 Pasture

Pasture land is land that is actively maintained for raising of livestock. It generally supports non-native grasses and forms suitable for livestock grazing. Pasture occurs offsite to the east, and totals 1.3 acres within the offsite impact area.

3.1.10 Developed Land

Approximately 0.9 acre of developed land consisting of the existing Cherry Valley Road occurs within the off-site impact area.

3.2 JURISDICTIONAL AREAS

3.2.1 USACE Jurisdictional Areas

Areas under USACE jurisdiction occur as several segments of non-wetland WUS, including 2 major drainages that traverse the site from east to west (Drainages A and B; Figure 5). The other drainages on site are tributaries to these main drainages. All USACE drainages are ephemeral. A total of 0.46 acre of USACE jurisdictional WUS occurs on site.

3.2.2 CDFW Jurisdictional Areas

Areas under CDFW jurisdiction exist in the same areas as those that are USACE jurisdictional (Figure 6), but are slightly wider. Approximately 1.37 acres of the CDFW drainages are ephemeral, while an additional 0.04 acre is considered disturbed wetland.

3.2.3 Riparian/Riverine Areas

All of the CDFW jurisdictional streambeds are also considered Riverine under the MSHCP. Two small areas of disturbed wetland are considered Riparian under Section 6.1.2 of the MSHCP.

3.3 PLANT SPECIES

A total of 60 plant species were observed during the surveys conducted by HELIX. A list of plant species observed is included in Appendix C.

3.4 ANIMAL SPECIES

A total of 74 animal species were observed during the surveys conducted by HELIX. A list of animals observed or detected is included in Appendix D. All of the animal species were identified by direct observation or vocalizations, the presence of scat and/or tracks, or other signs.

3.5 SENSITIVE RESOURCES

Sensitive resources are those defined as (1) habitat areas or vegetation communities that are unique, of relatively limited distribution, or of particular value to wildlife; and (2) species that have been given special recognition by federal, state, or local government agencies and organizations as a result of limited, declining, or threatened populations.

3.5.1 Sensitive Vegetation Communities

Sensitive vegetation communities on the San Gorgonio Crossings project site include mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral (including disturbed), and non-native grassland.

3.5.2 Sensitive Plant Species

One sensitive plant species, Yucaipa onion was observed on site

Yucaipa onion (*Allium marvinii*)
Status: --/-- CNPS List 1B, MSHCP covered.
Distribution: Previously only know from 2 other locations in California. Recently additional populations have been discovered within the MSHCP conservation area.
Habitat: clay soils in chaparral or sage scrub habitat.
Status on site: A total of 20 bulb clusters with 91 flowering heads were observed on site. The entire population of Yucaipa onion observed on the property is within an approximately 200 square foot area in the northeast corner of the property outside of the proposed impact area.

Sensitive Plant Species with Potential to Occur

Listed or sensitive plant species not observed during project-related site visits but are known to occur in the vicinity or may have potential to occur on site are described in Table 3. The list below also includes the MSHCP NEPSSA Area 8 plant species. Many of these species have specific habitat requirements that do not occur on the property. Species are listed by status and alphabetized (by scientific name) where status is the same. A key of the status codes presented can be found in Appendix E.

Table 3
LISTED OR SENSITIVE PLANT SPECIES WITH POTENTIAL TO OCCUR

SPECIES NAME	STATUS*	POTENTIAL TO OCCUR
Slender-horned spineflower (*Dodecahema leptoceras*)	FE/SE CNPS List 1B.1 MSHCP Covered	Not expected to low. Habitat of chaparral, woodland, and sage scrub with sandy soil does occur on site. Not observed on site during sensitive plant or other surveys conducted on site. This is an MSHCP covered species. Property not in MSHCP plant survey area for this species.
San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*)	FE/-- CNPS List 1B.1 MSHCP Covered	Not expected. Occurs in association with vernal pools, alkali scrub, and playas that are not present on site. Not observed during rare plant survey.
Yucaipa onion (*Allium marvinii*)	--/-- CNPS List 1B.1 MSHCP Covered	Present. A small population was observed in the northeast corner of the property, outside the impact area.
many-stemmed dudleya (*Dudleya multicaulis*)	--/-- CNPS List 1B MSHCP Covered	Not expected. Clay soils in barren, rocky areas with limited vegetation. Not observed during focused rare plant survey. Property does contain suitable habitat.
Smooth tarplant (*Centromadia pungens* ssp.*laevis*)	--/-- CNPS List 1B.1 MSHCP Covered	Not expected. Occurs in alkali soil habitats that are not present on the property. Not observed during rare plant or other survey of property; species is conspicuous and would have been seen if present.
Parry's spineflower (*Chorizanthe parryi* var. *parryi*)	--/-- CNPS List 1B.1 MSHCP Covered	Low. Prefers alluvial habitats of sage scrub and chaparral that are limited on site. Was not observed during the rare plant survey.

Table 3 (cont.) **LISTED OR SENSITIVE PLANT SPECIES WITH POTENTIAL TO OCCUR**		
SPECIES NAME	**STATUS***	**POTENTIAL TO OCCUR**
San Bernardino aster (*Symphyotrichum defoliatum*)	--/-- CNPS List 1B.2	Not expected. Primary habitat is vernal pools and ditches in areas that once supported vernal pools that are not present on site. Not observed during rare plant survey.
Plummer's mariposa-lily (*Calochortus plummerae*)	--/-- CNPS List 4.2 MSHCP Covered	Low. Chaparral, sage scrub, and grassland habitat present, along with rocky and granitic soils. Species not observed during rare plant survey.

*Refer to Appendix E for a listing and explanation of status and sensitivity codes.

3.5.3 Sensitive Animal Species

No threatened or endangered animal species were observed on the San Gorgonio Crossings property.

Three MSHCP covered species were observed/detected on the San Gorgonio Crossings property: orange-throated whiptail (*Cnemidophorus hyperythrus beldingi*), northern harrier (*Circus cyaneus*), and Bell's sage sparrow (*Amphispiza belli belli*). Belding's orange-throated whiptail and Northern harrier are state species of concern and Bell's sage sparrow is a USFWS bird of conservation concern and a CDFW watch list species. None of the 3 species are state or federally listed.

Belding's orange-throated whiptail (*Cnemidophorus hyperythrus beldingi*)
Status: --/SSC, MSHCP Covered
Distribution: Southern Orange County and southern San Bernardino County, south through Baja California
Habitat: Coastal sage scrub, chaparral, edges of riparian woodlands, and washes. Also found in weedy, disturbed areas adjacent to these habitats. Important habitat requirements include open, sunny areas, shaded areas, and abundant insect prey base, particularly termites (*Reticulitermes* sp.).
Status on site: Observed along disturbed sage scrub in northeastern portion of property.

Northern harrier (*Circus cyaneus*)
Listing: Nesting; --/SSC; Fully Protected; MSHCP Covered
Distribution: Widespread throughout temperate regions of North America and Eurasia. Winters and migrates throughout California from below sea level in Death Valley to an elevation of 9,800 feet.
Habitat: Coastal, salt, and freshwater marshlands; grasslands and prairies
Status on site: Observed flying over field on western portion of property.

Bell's sage sparrow (*Amphispiza belli belli*)
Status: USFWS BCC, CDFW WL:MSHCP Covered
Distribution: Patchy distribution throughout Southern California, which often shifts to include partially recovered burned areas. Populations are often clumped, but species no longer observed in most coastal areas.
Habitat(s): Chaparral and sage scrub with modest leaf-litter on the ground (e.g., after a fire or in gabbro-based soil areas)
Status on site: Observed in sage scrub on north and eastern portions of property.

Sensitive Animals with Potential to Occur

A list of sensitive animal species not observed on the San Gorgonio Crossings project impact area but that are known to occur in the vicinity is provided in Table 4. Species requiring habitat assessments and/or surveys under the MSHCP are also included in Table 4. Species are grouped into invertebrates and vertebrates (amphibians, reptiles, birds and mammals), listed by status, and alphabetized (by scientific name) where status is the same.

Table 4
LISTED OR SENSITIVE ANIMAL SPECIES WITH POTENTIAL TO OCCUR

SPECIES NAME	STATUS*	POTENTIAL TO OCCUR
INVERTEBRATES		
Vernal pool fairy shrimp (*Branchinecta lynchi*)	FT/-- MSHCP Covered	Not expected. No vernal pool or seasonal pond habitat present on site.
Santa Rosa Plateau fairy shrimp (*Linderiella santarosae*)	--/-- MSHCP Covered	Not expected. No vernal pool or seasonal pond habitat present on site.
Riverside fairy shrimp (*Streptocephalus woottoni*)	FE/-- MSHCP Covered	Not expected. No vernal pool or seasonal pond habitat present on site.

Table 4 (cont.) **LISTED OR SENSITIVE ANIMAL SPECIES WITH POTENTIAL TO OCCUR**		
SPECIES NAME	**STATUS***	**POTENTIAL TO OCCUR**
VERTEBRATES		
Amphibian		
Western spadefoot (*Spea hammondii*)	--/SSC MSHCP Covered	Low. Habitat of sandy and gravelly soils is present, but breeding pool habitat is not present on site.
Reptiles		
Red-diamond rattlesnake (*Crotalus ruber*)	--/SSC MSHCP Covered	Low to moderate. Prefers chaparral and coastal sage scrub along creek banks, particularly among rock outcrops, cacti, or debris piles with a supply of burrowing rodents for prey. Habitat occurs on site; rock outcrops and cacti limited on site.
coast horned lizard (*Phrynosoma blainvillii*)	--/SSC MSHCP Covered	Moderate. Preferred prey species (harvester ants) and preferred habitat (open sage scrub) both occur on site. Potential impacts to species are covered under the MSHCP.
Birds		
Least Bell's vireo (*Vireo bellii pusillus*)	FE/SE MSHCP Covered	Not expected. Suitable riparian habitat with developed canopy and understory not present on site.
Southwestern willow flycatcher (*Empidonax traillii extimus*)	FE/SE MSHCP Covered	Not expected. Occurs in mature riparian woodland habitat, which is not present on site.
Coastal California gnatcatcher (*Polioptila californica californica*)	FT/SSC MSHCP Covered	Low. Habitat (coastal sage scrub) occurs on site but species not heard or observed during the multiple surveys that occurred during the species' breeding season.
Burrowing owl (*Athene cunicularia*)	--/SSC MSHCP Covered	Low. Grassland and sparse sage scrub habitat present. Surveys over multiple years, all negative.
Cooper's hawk (*Accipiter cooperii*)	--/SSC MSHCP Covered	Low. Woodland habitat required for breeding not present on site. Foraging habitat is present.
Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)	--/SSC MSHCP Covered	Moderate. Coastal sage scrub habitat is present. Much of habitat disturbed and/or affected by recent fires.

Table 4 (cont.) **LISTED OR SENSITIVE ANIMAL SPECIES WITH POTENTIAL TO OCCUR**		
SPECIES NAME	**STATUS***	**POTENTIAL TO OCCUR**
VERTEBRATES (cont.)		
Birds (cont.)		
California horned lark (*Eremophila alpestris actia*)	--/-- MSHCP Covered	Not Expected. Prefers open plains with sparse vegetation and plowed fields of bare dirt, which are limited on site.
Tri-colored blackbird (*Agelaius tricolor*)	--/SSC MSHCP Covered	Not expected. Preferred habitat of reeds for breeding does not occur on site.
White-faced ibis (*Plegadis chihi*)	--/SSC MSHCP Covered	Not expected. Species prefers wetlands and ponds that are not present on site.
Mammals		
Stephens' kangaroo rat (*Dipodomys stephensi*)	FE/ST MSHCP Covered	Low. Habitat (open Riversidean sage scrub) occurs on site although at limits of this species' range.
Northwestern San Diego pocket mouse (*Chaetopdipus fallax fallax*)	--/SSC MSHCP Covered	Moderate. Habitat (coastal sage scrub and grassland) occurs on site. Potential impacts to species covered under MSHCP.
Los Angeles pocket mouse (*Perognathus longimembris brevinasus*)	--/SSC MSHCP Covered	Not expected. Habitat of open ground with loose sandy soils on site. Potential impacts to species covered under MSHCP.
San Diego Black-tailed jackrabbit (*Lepus californicus bennettii*)	--/-- MSHCP Covered	Low. Prefers brushy habitat in mountains and canyons that is present on the northeastern portion of the property. Species not observed during the multiple survey conducted on site.
Southern grasshopper mouse (*Onychomys torridus Ramona*)	--/SSC	Low. Prefers low lying arid sage scrub habitat that is limited on site, site is not within current known range.

*Refer to Appendix E for a listing and explanation of status and sensitivity codes.

4.0 REGIONAL AND REGULATORY CONTEXT

4.1 MULTIPLE SPECIES HABITAT CONSERVATION PLAN

The proposed project area is included in the MSHCP, which is a comprehensive multi-jurisdictional effort that includes Riverside County and multiple cities, including the unincorporated community of Cherry Valley. Rather than addressing sensitive species on an individual basis, the MSHCP focuses on conservation of 146 species, including those listed at federal and state levels and those that could become listed in the future. The MSHCP proposes a Reserve system of approximately 500,000 acres, of which 347,000 acres are currently within public ownership and 153,000 acres will need to be assembled from lands currently in private ownership. The MSHCP allows the County and other permittees to issue take permits for listed species so that applicants need not seek endangered species incidental take authorization from the USFWS and CDFW.

On June 17, 2003, the County Board of Supervisors adopted the MSHCP, certified its Environmental Impact Report/Environmental Impact Statement (EIR/EIS), and authorized the board chairman to sign the Implementing Agreement. The Incidental Take Permit was issued by the wildlife agencies on June 22, 2004. The County is a Permittee under the MSHCP.

4.1.1 Reserve Configuration Objectives

Regions of the MSHCP have been organized into Area Plans that mostly coincide with logical political boundaries, including city limits or long-standing unincorporated communities. The project is within the Pass Area Plan but lies entirely outside of any Criteria Cells, Public Quasi Public (PQP), or other MSHCP-targeted Conservation Area. MSHCP Criteria Cells occur approximately 0.5 mile north of the property and 1.5 miles to the south. The Pass Area Plan has a target conservation acreage of 22,510 to 27,895 acres, of which 13,970 is existing PQP land and the remainder is anticipated to be conserved within the city limits of Banning, Calimesa, and Beaumont. The San Gorgonio Crossings project site does not occur within existing or proposed Cores and Linkages of the Pass Area Plan. The MSHCP Reserve configuration does not include conservation of lands that occur on the project site, and, therefore, the project consistent with reserve configuration objectives of the MSHCP.

4.1.2 Covered Species Survey and Conservation Requirements

For certain MSHCP-covered species, adequate information was not available at the time the plan was prepared to ensure that appropriate conservation would occur. As a result, surveys are required for these plant and animal species under MSHCP Sections 6.1.2, 6.1.3, and 6.3.2. For applicable species, site-specific focused surveys are required to be conducted on projects within designated survey areas where appropriate habitat is present. Where survey results are positive, projects with potential to affect species are subject to avoidance, minimization, and mitigation strategies.

As noted earlier, the proposed project site is within a NEPSSA area for 2 plant species: many-stemmed dudleya and Yucaipa onion. Because some habitat for these species does exist

on site, a rare plant survey was conducted. A total of 20 bulb clusters of Yucaipa onion with 91 flowering heads were observed on site. The entire population of Yucaipa onion observed on the property is within an approximately 200 square foot area in the northeast corner of the property outside of the proposed impact area. No other NEPSSA, federal or state-listed, or sensitive plant species were observed during the rare plant survey or during other surveys conducted on the property.

The San Gorgonio Crossings parcel is not within any designated survey area for any mammal or amphibian species. The project is not within a Criteria Area Species Survey Area (CASSA) survey area. The project is within the survey area for burrowing owl. Because habitat for this species does exist on site, focused surveys were conducted but no burrowing owls were observed.

Presence/absence surveys are required within 30 days prior to disturbance where suitable habitat is present. Take of active nests must be avoided; passive relocation must be conducted when owls are present outside the nesting season.

For species that primarily inhabit Riparian/Riverine habitats, conservation is dependent on ensuring that habitat function and value are maintained. If mapping identifies suitable habitat for Riparian/Riverine covered species (i.e., least Bell's vireo [*Vireo bellii pusillus*], southwestern willow flycatcher [*Empidonax traillii extimus*], western yellow-billed cuckoo [*Coccyzus americanus occidentalis*], Riverside fairy shrimp [*Streptocephalus woottoni*], Santa Rosa Plateau fairy shrimp [*Linderiella santarosae*], and vernal pool fairy shrimp [*Branchinecta lynchi*]) and these habitats will be affected, then focused surveys for these species are required. Three ephemeral drainages cross the project site. The drainages do not comprise habitat with potential to support the above species; therefore, focused surveys for the above species are not required. The drainages are categorized as Riparian/Riverine under the MSHCP due to the potential to support downstream sensitive resources.

Because the proposed project would result in impacts to Riparian/Riverine resources, a Determination of Biologically Equivalent or Superior Preservation (DBESP) analysis must be prepared to be consistent with Section 6.1.2. The DBESP, which is being prepared concurrently with this report, will describe mitigation that will be equal or superior with respect to the functions and values of the drainages proposed to be impacted.

4.2 FEDERAL GOVERNMENT

Administered by the USFWS, the federal Endangered Species Act (ESA) provides the legal framework for the listing and protection of species (and their habitats) identified as being threatened with extinction or endangered. Section 10(a) of ESA regulates actions that could jeopardize threatened or endangered species and allows issuance of permits for "incidental" take of such species. The term "incidental" applies if the taking of a listed species is incidental to and not the purpose of an otherwise lawful activity. The MSHCP has been issued under this section and provides incidental take for all covered species.

Nesting raptors (such as northern harriers, red-tailed hawks, and burrowing owls) and other migratory birds are protected under the federal Migratory Bird Treaty Act (MBTA). This law is generally protective of migratory birds but does not actually stipulate the type of protection required. In common practice, the USFWS places restrictions on disturbances allowed near active migratory bird nests.

Federal wetland regulation (non-marine issues) is guided by the Rivers and Harbors Act of 1899 and Clean Water Act. The Rivers and Harbors Act deals primarily with discharges into navigable waters, while the purpose of the Clean Water Act is to restore and maintain the chemical, physical, and biological integrity of all WUS. Impacts to wetland WUS (including disturbed wetlands and vernal pools) are regulated by the USACE under Section 404 of the Clean Water Act (33 United States Code [U.S.C.] 401 et seq.; 33 U.S.C. 1344; U.S.C. 1413; and Department of Defense, Department of the Army, Corps of Engineers 33 Code of Federal Regulations [CFR] Part 323). A federal Clean Water Act Section 404 Permit would be required for the project to place fill in wetland WUS. Impacts to less than 0.50 acre of wetland WUS would be processed with a Nationwide Permit, while impacts equal to or greater than 0.50 acre would require an Individual Permit. A Clean Water Act Section 401 Water Quality Certification, which is administered by the State Water Resources Control Board, must be issued prior to any 404 Permit. Because there are USACE jurisdictional features on site, a 404 Permit will be required.

4.3 STATE OF CALIFORNIA

The California ESA is similar to the federal ESA in that it contains a process for listing of species and regulating potential impacts to listed species. Section 2081 of the California ESA authorizes the CDFW to enter into a memorandum of agreement for take of listed species for scientific, educational, or management purposes. The MSHCP has been issued under this section.

The Native Plant Protection Act (NPPA) enacted a process by which plants are listed as rare or endangered. The NPPA regulates collection, transport, and commerce in plants that are listed. The California ESA follows the NPPA and covers both plants and animals determined to be threatened with extinction or endangered. Plants listed as rare under the NPPA are designated as threatened under the California ESA. No plants listed under the California ESA occur on the San Gorgonio Crossings project site.

The California Fish and Game Code (Sections 1600 et seq.) requires an agreement between the project applicant and CDFW for projects affecting riparian and wetland habitats through issuance of a Streambed Alteration Agreement (SAA). It is assumed that the project will require a 1602 SAA from the CDFW.

4.4 ADDITIONAL REGULATORY CONSIDERATIONS

The San Gorgonio Crossings project site does not fall within the Stephens' kangaroo rat (*Dipodomys stephensi*; SKR) fee area outlined in the Riverside County SKR Habitat Conservation Plan (HCP; County 1996). The proposed project is not subject to the SKR fee.

5.0 IMPACTS

This section describes potential direct and indirect impacts associated with the proposed project. Direct impacts immediately alter the affected biological resources such that those resources are eliminated temporarily or permanently. Indirect impacts consist of secondary effects of a project, including noise, decreased water quality (e.g., through sedimentation, urban contaminants, or fuel release), fugitive dust, colonization of non-native plant species, animal behavioral changes, and night lighting. The magnitude of an indirect impact can be the same as a direct impact; however, the effect usually takes a longer time to become apparent.

5.1 DIRECT IMPACTS

5.1.1 Vegetation Communities/Habitats

The proposed project would impact 145.6 acres on the San Gorgonio Crossings property on site, and an additional 13.5 acres off site (Figure 7). Impacts to mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral (including disturbed), and non-native grassland are considered significant. Refer to Table 5 for a summary of vegetation community impacts.

Table 5
VEGETATION COMMUNITY IMPACTS*

VEGETATION COMMUNITY	ACRE(S)*+	IMPACTS+	OPEN SPACE/ NOT IMPACTED
Mule fat scrub	0.06	0.06	0.0
Riversidean sage scrub	7.8	2.4	5.4
Riversidean-Diegan coastal sage scrub (including disturbed)	28.1	19.5	8.6
Coastal sage-chaparral scrub (including disturbed)	0.5	0	0.5
Scrub oak chaparral (including disturbed)	12.7	5.6	7.1
Non-native grassland	183.7	123.8	59.9
Eucalyptus woodland	0.6	0.2	0.4
Disturbed habitat	7.7	5.3	2.4
Pasture	1.3	1.3	0
Developed	0.9	0.9	0
TOTAL	**243.4**	**159.1**	**84.3**

*Acre(s) are rounded to the nearest 0.1, except for acre(s) under 0.1, which are rounded to the nearest 0.01; thus, totals reflect rounding.

+Includes off-site impact areas

5.1.2 Jurisdictional Areas

USACE Jurisdictional Areas

Direct impacts to USACE jurisdictional areas would result from development of the project. Impacts to USACE jurisdictional areas total 0.40 acre, all comprised of ephemeral drainage (Figure 8; Table 6). No impacts to USACE jurisdictional wetlands will occur. The impacts to the non-wetland ephemeral drainage are considered significant.

CDFW Jurisdictional Areas

Direct impacts to CDFW jurisdictional areas would result from development of the project. Impacts to CDFW jurisdictional areas resulting from proposed project implementation total 1.11 acres, comprised of 1.07 acres of streambed and 0.04 acre of disturbed wetland (Figure 9; Table 6). These impacts are considered significant.

Table 6
USACE AND CDFW JURISDICTIONAL AREA IMPACTS (acre)

JURISDICTIONAL AREA	USACE	CDFW
Ephemeral drainage/streambed	0.40	1.11
TOTAL	**0.40**	**1.11**

5.1.3 Sensitive Plant Species

The San Gorgonio Crossings project would not result in impacts to NEPSSA, listed, or sensitive plant species.

5.1.4 Sensitive Animal Species

No impacts to federal or state listed animal species will result from project implementation. Three MSHCP covered sensitive animal species (orange-throated whiptail, northern harrier, and Bell's sage sparrow) were observed or detected on site and would be directly impacted by the proposed project because their habitats would be adversely affected. Impacts to these species are not considered significant, as they are covered under the MSHCP.

Implementation of the proposed project would directly impact raptor foraging habitat. In addition, the eucalyptus trees on site have potential to support nesting raptor species such as the red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*B. lineatus*), or great-horned owl (*Bubo virginicus*), and there is potential to directly or indirectly impact raptor nests during construction. These impacts are considered adverse but not significant. Direct impacts to an active raptor nest are not allowed under the federal MBTA and direct take of active raptor nests would be considered significant.

5.1.5 MSHCP Consistency

As described in Section 4, the San Gorgonio Crossings property lies outside of any Criteria Cells; therefore, the proposed project is not required to conserve habitat on site with respect to Criteria Cells.

MSHCP Section 6.1.2 focuses on protection of Riparian/Riverine and vernal pool habitat types. The proposed project will comply with the policies of Section 6.1.2 that protect species associated with vernal pools and Riparian/Riverine habitats. Vernal pools do not exist on the San Gorgonio Crossings project; therefore, vernal pool species do not occur.

The definition of Riparian/Riverine habitats is based on the potential for the habitat to support Riparian/Riverine covered species (i.e., least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo). The ephemeral drainages/streambed on site are not suitable for any of these species; however, the drainages have potential to support downstream Riparian/Riverine habitats and are, therefore, considered Riparian/Riverine habitats under the MSHCP.

Twenty-four plant species are identified in the MSHCP as potentially occurring in Riparian/Riverine and vernal pool habitats. Shrub and tree species such as California black walnut (*Juglans californica* var. *californica*), Engelmann oak (*Quercus engelmannii*), Coulter's matilija poppy (*Romneya coulteri*), and San Miguel savory (*Satureja chandleri*) would have been readily identifiable during project surveys but were not found on site. Several species, including spreading navarretia (*Navarretia fossalis*), California Orcutt grass (*Orcuttia californica*), prostrate navarretia (*Navarrettia prostrate*), San Diego button-celery (*Eryngium aristulatum* var. *parishii*), thread-leaved brodiaea (*Brodiaea filifolia*), fish's milkwort (*Polygala cornuta* var. *fishiae*), lemon lily (*Lilium parryi*), ocellated Humboldt lily (*L. humboldtii* ssp. *ocellatum*), Mojave tarplant (*Deinandra mohavensis*), Parish's meadowfoam (*Limnathes gracilis* var. *parishii*), and slender-horned spineflower (*Dodecahema leptoceras*), have distributions well outside of the study area. The remaining species have a distribution that includes the project area or occur in habitats found on site and are discussed in greater detail below. None of the 24 MSHCP Riparian/Riverine species was observed on the property.

The Santa Ana River woolly-star (*Eriastrum densifolium* spp. *sanctorum*) is found along the Santa Ana River in 2 locations and is restricted to open washes and early-successional alluvial fan scrub on open slopes above main watercourses, such as the Santa Ana River on fluvial deposits, where flooding and scouring occur at a frequency that allows the persistence of open shrublands. No appropriate habitat occurs on site for the Santa Ana River woolly-star.

Suitable habitat for Brand's phacelia (*Phacelia stellaris*) includes coastal dunes and/or coastal scrub in sandy openings, sandy benches, dunes, sandy washes, or flood plains of rivers at elevations between 0 and 1,200 feet. Brand's phacelia is known from 2 locations on sandy terraces along the Santa Ana River (at Fairmont Park and along a horse trail in the Santa Ana Wilderness Area along the Santa Ana River). Given the highly disturbed nature of the site, this species is not expected to occur.

Graceful tarplant (*Holocarpha virgata* ssp. *elongata*) occurs in chaparral, cismontane woodland, coastal sage scrub, and valley and foothill grasslands below 1,900 feet (CNPS 2007). This species would not be expected to occur on site because the site's elevation is higher than the known range for this species.

Mud nama (*Nama stenocarpum*) is restricted to muddy embankments of marshes and swamps and within lake margins and riverbanks (CNPS 2007). Three populations are known from Riverside County, with 2 occurring along the San Jacinto River (Dudek 2003). No appropriate habitat occurs on the project site.

Orcutt's brodiaea (*Brodiaea orcuttii*) occurs in clay soils in mesic native and non-native grasslands that often include vernal pools, as well as moist meadows and along stream courses at higher elevations (Reiser 2001; CNPS 2007). The core population in Riverside County is the Santa Rosa Plateau (Dudek 2003). No clay soils are present on site.

San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*) is restricted to grassland, playas, and vernal pools with alkali soils (Dudek 2003). This species typically occurs on the margins of areas subject to short-term inundation and does not develop in areas that support regular long-term ponding or flooding. No alkali soils or appropriate habitat occur on site.

Smooth tarplant (*Centromadia pungens*) is found in southwestern California and northwestern Baja California, Mexico (Baja) and occurs in San Bernardino, Riverside, and San Diego counties. This species occurs in a variety of habitats, including alkali scrub and playas, riparian woodland, watercourses, and grasslands with alkaline affinities (Dudek 2003; CNPS 2007). No alkali soils are present on site.

Vernal barley (*Hordeum intercedens*) occurs in grassland, vernal pools, and vernal playas and is restricted to clay and alkaline, silty-clay soils in Riverside County (Dudek 2003). Twelve populations are known from Riverside County along the San Jacinto River and Salt Creek. No appropriate soils occur on site.

Consistency with Section 6.1.2 of the MSHCP, as well as mitigation measures to replace the function and values of the Riverine area on site, are detailed in the DBESP analysis (HELIX 2014).

The project is within an area designated as a NEPSSA area for 2 plant species: Yucaipa onion and many-stemmed dudleya. Sensitive plant surveys were conducted and a small population of Yucaipa onion was observed. The project will avoid 100 percent of the population; therefore, the project is consistent with MSHCP Section 6.1.3.

Section 6.1.4 addresses potential indirect impacts to MSHCP preserve lands such as the Criteria Cells located 0.5 mile north of the proposed project site. The proposed development is designed to leave open space between the development and the northern property border; as a result, the development will occur more than 0.5 mile from MSHCP Conservation Areas and is therefore not subject to Section 6.1.4. Since the project does border open space, the following measures will be implemented by the project to minimize potential indirect impacts:

- BMPs would be implemented to maintain water quality. All runoff would be treated prior to exiting the site or draining into potential preserve areas to reduce pollutants of concern. There would be no change in water flow from the project site;

- The proposed project is the construction of a job center, and it is not expected to produce any toxics or bioproducts that would significantly affect any MSHCP Conservation Area. Any potential pollutants (e.g., increased levels of phosphorous or nitrogen) would be treated through implementation of BMPs;

- The project is not expected to generate levels of noise greater than that of any standard commercial development and is not expected to adversely affect any MSHCP Conservation Area;

- No plants included on the California Invasive Plant Council's (Cal-IPC's) list of invasive species (2006) or in MSHCP Table 6-2 would be used anywhere on site; and

- Manufactured slopes associated with the proposed site development would not extend into any proposed MSHCP Conservation Area.

The project is not within any CASSA area for amphibians or mammals. The project occurs within the burrowing owl survey area. Because no burrowing owls or owl sign was observed during the protocol survey, no conservation is required on site. The project is consistent with MSHCP Section 6.3.2.

5.2 INDIRECT IMPACTS

5.2.1 Noise

Noise from such sources as grubbing, earthwork, and construction would be a temporary impact to local wildlife. Noise-related impacts would be considered significant if listed species were displaced and failed to breed; however, no listed species are known to occur immediately adjacent to the project site. The site is not adjacent to MSHCP Reserve lands, so long-lasting noise from the proposed project would not result in a significant effect to the Reserve.

5.2.2 Water Quality

Water quality in jurisdictional areas can be adversely affected by potential surface runoff and sedimentation during construction. The use of petroleum products (e.g., fuels, oils, and lubricants) and erosion of cleared land during construction could potentially contaminate surface water. Decreased water quality may adversely affect vegetation, aquatic animals, and terrestrial wildlife that depend upon these resources. Impacts to water quality would be significant unless mitigated.

5.2.3 Fugitive Dust

Fugitive dust produced by construction has the potential to disperse onto preserved vegetation, which may reduce the overall vigor of individual plants by reducing their photosynthetic capabilities and increasing their susceptibility to pests or disease. That, in turn, could affect animals dependent on these plants (e.g., raptors or seed-eating rodents). Dust dispersal during project construction would be substantially controlled by standard measures such as water applications during grading between dozer/scraper passes. Because active construction areas and unpaved surfaces would be watered pursuant to grading permit requirements to minimize dust, impacts on biological resources would be less than significant.

5.2.4 Non-native Plant Species

Non-native plants could colonize areas disturbed by construction and development and could potentially spread into adjacent native habitats. Many non-native plants are highly invasive and can displace native vegetation (reducing native species diversity), potentially increase flammability and fire frequency, change ground and surface water levels, and potentially adversely affect native wildlife dependent on native plant species. To prevent potentially significant impacts, exotic/invasive plant species included in the California Invasive Plant Inventory prepared by Cal-IPC (2006) or in MSHCP Table 6-2 would not be used anywhere on site. Therefore, no significant impacts relating to the introduction of non-native plant species are anticipated.

5.2.5 Lighting

Lighting on native habitats can prevent nocturnal wildlife from using an area. Although no lighting is expected to occur within the construction zone because work would occur during the day, there is a potential for night lighting at staging areas for security purposes. Lighting could cause an increased loss in native wildlife. Lighting on native habitats can provide nocturnal predators with an unnatural advantage over their prey. Because no MSHCP preserve lands will be located immediately adjacent to the site, no significant indirect impacts from lighting are expected.

5.2.6 Downstream Hydrology

Sensitive plant species and riparian habitat occur off site and downstream of the proposed project that are dependent upon periodic flows from both on site and upstream of the project. Any adverse change in downstream hydrology to these resources would be considered significant. The proposed project has been designed to ensure that no change in the current hydrological condition will result from project implementation, and no significant impacts to downstream hydrology are anticipated.

6.0 MITIGATION MEASURES

6.1 MITIGATION FOR DIRECT IMPACTS

6.1.1 Vegetation Communities/Habitats

The project applicant shall pay MSHCP Local Development Mitigation Fees (LDMF) as determined by the County. The fee schedule is adjusted annually by the Western Riverside County Regional Conservation Authority (RCA) and was last adjusted on July 1, 2008. The current fee is $6,597 per acre for commercial or industrial uses (RCA 2008). When mixed uses are proposed within the same project, the commercial fee is applied to the whole project based on the underlying classification of the property at the time of issuance of a building permit. Impacts to sensitive vegetation communities will be mitigated to below a level of significance through payment of the MSHCP LDMF.

6.1.2 Riparian/Riverine, USACE, and CDFW Jurisdictional Areas

Section 6.1.2 of the MSHCP focuses on protection of Riparian/Riverine areas and vernal pool habitats capable of supporting MSHCP covered species, particularly within the identified Conservation Area. The project site encompasses 1.37 acres of unvegetated, ephemeral drainage courses that are considered Riverine under Section 6.1.2 and 0.04 acre of disturbed wetland that is considered Riparian. The functions of the unvegetated Riparian/Riverine streams on the property are primarily water conveyance, sediment transport, and energy dissipation (hydrologic regime and flood attenuation).

A DBESP is being prepared for the project (HELIX 2014). The goal of the DBESP process is to determine whether the project has, in fact, provided for a project alternative that results in biologically equivalent or superior preservation. The first priority for sensitive habitats under CEQA and the MSHCP is avoidance of direct impacts. The proposed land use requires large pads that cannot be effectively reshaped to avoid Riparian/Riverine resources. Complete avoidance of Riparian/Riverine resources would eliminate the viability of development on the site because of the distribution of the drainages across the site. Total avoidance can be achieved only by minimal or no project alternatives, which render the project infeasible.

The current project does avoid impacts to 0.30 acre of Riparian/Riverine resources in the northwestern portion of the site. Impacts to 0.30 acres (23 percent) of the Riparian/Riverine resources have been avoided to the maximum extent practicable.

Section 6.2.1 of the MSHCP states:

> If an avoidance alternative is not Feasible, a practicable alternative that minimizes direct and indirect effects to Riparian/Riverine areas and vernal pools and associated functions and values to the greatest extent possible shall be selected.

Mitigation measures that would result in equivalent or superior preservation of the functions and values of Riparian/Riverine resources impacted by the project are shown here. Minimization measures for the proposed project will include the use of standard BMPs to minimize the impacts

during construction. Equipment will be stored in upland areas, outside of drainages except as required by project design (restoration, trash removal, etc.). Removal of trash located throughout the property will decrease the potential of pollutants entering the Riparian/Riverine areas downstream. The removal of the pollutants will increase the functions and values of the Riparian/Riverine areas proposed to be restored, thus replacing a portion of functions and values that will be lost within the project footprint.

Source control and treatment control BMPs will be implemented to minimize the potential contaminants that generated during and post construction. Source control BMPs include landscape planning, roof runoff controls, trash storage areas, use of alternative building materials, and education of future tenants. Treatment control BMPs include detention basins, vegetated swales (bio-swales), drain inlets, and vegetated buffers. Water quality BMPs will be implemented throughout the project to capture and treat contaminants.

Mitigation for impacts to Riparian/Riverine resources will occur through on-site creation at a 2:1 ratio for the 1.11 acres of impacts to Riparian/Riverine resources. In total, the proposed mitigation will result in 2.22 acres of Riparian and Riverine habitat creation/restoration.

The on-site creation of 2.22 acres of Riparian and Riverine habitat will occur at 2 locations on site along the southern boundary (Figure 10). The mitigation areas will receive all upstream flows up to 100 cubic feet per second (CFS). Flows above 100 CFS will bypass the mitigation area in a concrete-lined channel that will outlet at the eastern edge of the project. Flows up to 100 CFS will allow for creation of a braided streambed similar to the drainages that are being impacted. These areas will be revegetated with primarily floodplain scrub vegetation. Scattered pockets of mule fat scrub will also be planted to increase vegetative diversity. Combined, these areas will offset losses of Riparian/Riverine functions and values by providing high quality Riparian/Riverine habitat, as well as other functions and services such as water quality benefits, groundwater recharge, and nutrient cycling. A detailed restoration plan for the on-site mitigation sites will be prepared and submitted to the County for review and approval prior to implementation of the restoration effort.

The amount of mitigation required by the regulatory agencies for impacts to 0.40 acre of USACE and 1.11 acres of CDFW jurisdictional areas will be determined during the permitting process.

6.1.3 Animal Species

Pre-construction presence/absence surveys for burrowing owl shall be conducted on and off site by a qualified biologist within 30 days prior to project disturbance activities, with the results summarized in a report submitted to the County Planning Department, Environmental Programs Division. Owls located as a result of survey efforts will be relocated. A relocation plan shall be submitted to the Environmental Programs Division of the Planning Department for review and approval.

Clearing and grubbing shall occur outside of the bird breeding season (February 1 to August 31), unless a qualified biologist demonstrates to the satisfaction of the County that all nesting is complete through completion of a Nesting Bird Clearance Survey. A Nesting Bird Clearance

0 400 Feet

Figure 10

CVAR_09434

Survey report shall be submitted to the Environmental Programs Division for review and approval prior to initiating clearing and grubbing during the breeding season.

6.2 MITIGATION FOR INDIRECT IMPACTS

6.2.1 Water Quality

During project construction, measures shall be implemented to control erosion, sedimentation, and pollution that could impact water resources on and off site. Potential impacts to water quality (on and off site) would be minimized through project design measures as well as compliance with applicable city storm water permitting requirements and the National Pollutant Discharge Elimination System (NPDES) requirements.

6.3 LEVEL OF SIGNIFICANCE AFTER MITIGATION

The proposed project would significantly impact sensitive habitats and MSHCP Riparian/Riverine habitat. Significant impacts to USACE and CDFW jurisdictional areas would occur through implementation of the proposed project. Potentially significant impacts could occur to breeding birds if clearing of vegetation were to occur during the breeding season. Significant indirect or temporary impacts are limited to water quality.

Impacts to sensitive habitats will be mitigated through payment of the MSHCP LDMF of $6,597. Impacts to USACE and CDFW jurisdictional habitats along with impacts to MSHCP Riverine areas shall be mitigated to below a level of significance by on-site creation or restoration at a 2:1 ratio. Impacts to breeding birds shall be avoided through clearing of habitat outside of the breeding season. Indirect impacts associated with water quality shall be mitigated to below a level of significance through compliance with NPDES requirements.

Following implementation of these mitigation measures, all impacts to biological resources will be mitigated to below a level of significance.

Irvine, CA 92618

Subject: Results of Burrowing Owl (*Athene cunicularia*) Survey for the Interstate 10 Gateway Job Center

Dear Mr. Rupp:

At your request, HELIX Environmental Planning, Inc. (HELIX) conducted a focused burrowing owl survey for the Interstate (I-) 10 Gateway Job Center project site. This letter documents the results of the survey, which meets applicable conditions under the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) approved in 2003. The MSHCP is a comprehensive planning effort that includes the County of Riverside (County) and 15 cities. As part of the MSHCP implementation, enrolled jurisdictions are required to impose terms of the MSHCP, including appropriate surveys in accordance with Section 6, Volume I. The site is within the survey area for burrowing owl; therefore, surveys are required if potential habitat is present (Dudek and Associates 2003). This report presents the details and results of the 2008 survey and includes survey results for the burrowing owl conducted in 2005 and 2007.

PROPERTY LOCATION AND DESCRIPTION

The approximately 230-acre property is located east of I-10 and north of Cherry Valley Boulevard in the unincorporated community of Cherry Valley, Riverside County, California (Figure 1). The site is situated in Section 30, Township 2 South, Range 1 West as shown on the U.S. Geological Survey 7.5-minute El Casco quadrangle (Figure 2).

Elevation on site ranges from 2,400 to 2,690 feet above mean sea level. The property is bordered by a chicken ranch to southeast. There is a small horse ranch and I-10 is to the southwest. To the northwest, there is some agricultural land and a residential community. The remainder of the property is bordered by undeveloped land, with the exception of a few rural residential homes to the north. An aerial photo of the property is provided as Figure 3.

PROJECT DESCRIPTION

The proposed project is for the construction of 2 large industrial buildings on approximately 190 acres of the property. The project includes detention basins, parking, landscaping, and other associated infrastructure.

METHODS

The survey was conducted according to the burrowing owl survey guidelines for the MSHCP (County 2006). The survey area included all habitats with potential to support burrowing owls within the project area. Transects approximately 20 to 30 meters apart were surveyed on the entire project site. Steep slopes were visually surveyed with the aid of binoculars. A 500-foot buffer zone was surveyed visually from the subject property, where owl habitat bordered the site. Biologists walked slowly and methodically, closely checking the areas that met the basic requirements of owl habitat, listed below.

- Open expanses of sparsely vegetated areas (less than 30 percent canopy cover for trees and shrubs)
- Gently rolling or level terrain
- An abundance of small mammal burrows, especially those of California ground squirrel (*Spermophilus beecheyi*)
- Fence posts, rock, or other low perching locations

Survey dates, times, and conditions are listed in Table 1.

Table 1

The first survey of the property covered the entire project area, where biologists searched for burrows with potential to support burrowing owls. Figure 4 identifies the approximate transects surveyed on the property. The topography of the

property caused some variation in the actual transects surveyed. Areas that did not contain burrows with potential to support burrowing owls were not surveyed on subsequent surveys. These excluded areas are comprised of dense vegetation (Figure 5a) or disturbed areas (Figure 5b) lacking burrows with potential to support burrowing owls. Potential owl burrow locations on site include brush piles, fossorial mammal burrows, and rock piles. All potential owl burrows were checked for signs of recent owl occupation, which include:

- Pellets/Casting – regurgitated fur, bones, and insect parts
- White wash – excrement
- Feathers

RESULTS

Vegetation Habitats

Six vegetation habitats along with a small amount of developed habitat occur on the property. The habitats are mule fat scrub, Riversidean sage scrub, coastal sage-chaparral ecotone, scrub oak chaparral, non-native grassland, and disturbed habitat. The survey area was comprised mainly of non-native grassland, Riversidean sage scrub, and disturbed habitats.

Burrowing Owls

No burrowing owls were observed during any of the site visits. Burrows that could support burrowing owls were observed on site but did not show any signs of owl activity. The burrows were primarily located in the southern and western portions of the property. The northern and eastern areas of the property contain relatively few burrows with potential to support burrowing owls. The majority of the grassland on site was comprised of dense stands of mustard (*Hirschfeldia incana*, *Brassica* spp.), Russian thistle (*Salsola tragus*), bromes (*Bromus* spp.), and various weeds, herbs, and forbs.

There are approximately 120 acres of habitat in the project area with low potential to support burrowing owls. The remainder of the property lacks burrows that could support burrowing owls, or is covered with dense vegetation. Surveys conducted in 2005, 2007, and 2008 all had negative results. No burrowing owls or sign of burrowing owl is present on site.

The MSHCP states that pre-construction surveys for burrowing owls should be conducted for all properties that contain suitable burrowing owl habitat. A pre-construction survey is to take place within 30 days prior to disturbance of the property in question.

Attachment A contains a list of animal species observed or detected during the 3 years of burrowing owl surveys and other surveys conducted on the property.

Please call Barry Jones at (619) 462-1515 or me at (951) 328-1700 if you have any questions about this report.

Sincerely,

Rob Hogenauer
Wildlife Biologist

FEDERAL JURISDICTIONAL INFORMATION

Appendix B
FEDERAL JURISDICTIONAL INFORMATION

Wetlands and "Waters of the U.S." Definitions

The U.S. Army Corps of Engineers (Corps; Federal Register 1982) and the Environmental Protection Agency (Federal Register 1980) jointly define wetlands as "[t]hose areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (Environmental Laboratory 1987).

The official definition of "Waters of the U.S." and their limits of jurisdiction (as they may apply) are defined by the Corps' Regulatory Program Regulations (Section 328.3, paragraphs [a] 1-3 and [e], and Section 328.4, paragraphs [c] 1 and 2) as follows:

> All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; all waters including interstate wetlands, all other waters such as interstate lakes, rivers, streams [including intermittent streams], mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate commerce including any such water, which are or could be used by interstate travelers for recreation or other purposes; or from which fish or shellfish are or could be taken and sold in interstate commerce; or which are or could be used for industries in interstate commerce; or wetlands adjacent to waters [other than waters that are themselves wetlands].
>
> Non-tidal Waters of the U.S. The limits of jurisdiction in non-tidal waters: In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high water mark, or when adjacent wetlands are present, the jurisdiction extends to the limit of the adjacent wetlands.
>
> The term ordinary high water mark means that line on the shore established by the fluctuation of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation (scouring), the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

Waters of the U.S. must exhibit an ordinary high water mark (OHWM) or other evidence of surface flow created by hydrologic physical changes. These physical changes include (Riley 2005):

- Natural line impressed on the bank
- Shelving
- Changes in the character of soil
- Destruction of terrestrial vegetation
- Presence of litter and debris
- Wracking
- Vegetation matted down, bent, or absent
- Sediment sorting
- Leaf litter disturbed or washed away
- Scour
- Deposition
- Multiple observed flow events
- Bed and banks
- Water staining
- Change in plant community

Jurisdictional areas also must be connected to Waters of the U.S. (Guzy and Anderson 2001; U.S. Supreme Court 2001).

As a consequence of the U.S. Supreme Court decision in Rapanos v. United States, a memorandum was developed regarding Clean Water Act jurisdiction (Grumbles and Woodley 2007). The memorandum states that the EPA and the Corps will assert jurisdiction over traditional navigable waters (TNW), wetlands adjacent to TNW, tributaries to TNWs that are a relatively permanent water body (RPW), and wetlands adjacent to TNW. An RPW has year round flow or continuous seasonal flow (i.e., typically for three months or longer). Jurisdiction over other waters (i.e., non TNW and RPW) will be based on a fact specific analysis to determine if they have a significant nexus to a TNW.

Pursuant to the Corps Instructional Guidebook (Corps and EPA 2007), the significant nexus evaluation will cover the subject reach of the stream (upstream and downstream) as well as its adjacent wetlands (Illustrations 2 through 6, Corps and EPA 2007). The evaluation will include the flow characteristics, annual precipitation, ability to provide habitat for aquatic species, ability to retain floodwaters and filter pollutants, proximity of the subject reach to a TNW, drainage area, and the watershed.

Wetland Criteria

Wetland boundaries are determined using three mandatory criteria (hydrophytic vegetation, wetland hydrology, and hydric soil) established for wetland delineations and described within the Wetlands Delineation Manual (Environmental Laboratory 1987) and the Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Corps 2006). Following is a brief discussion of the three criteria and how they are evaluated.

Vegetation

"Hydrophytic vegetation is defined herein as the sum total of macrophytic plant life that occurs in areas where the frequency and duration of inundation or soil saturation produce permanently or periodically saturated soils of sufficient duration to exert a controlling influence on the plant species present" (Environmental Laboratory 1987).

The wetland indicator status (obligate upland, facultative upland, facultative, facultative wetland, obligate wetland, or no indicator status) of the dominant plant species of all vegetative layers is

determined. Species considered to be hydrophytic include the classifications of facultative, facultative wetland, and obligate wetland as defined by the U.S. Fish and Wildlife Service (1988; Table A-1). The percent of dominant wetland plant species is calculated. The hydrophytic vegetation criterion is considered to be met if it meets the "Dominance Test," "Prevalence Index," or the vegetation has morphological adaptations for prolonged inundation.

Table B-1
DEFINITIONS OF PLANT INDICATOR CATEGORIES

Indicator Categories	Abbreviation	Probability of Occurring in Wetlands
Obligate wetland	OBL	Occur almost exclusively in wetlands
Facultative wetland	FACW	Usually found in wetlands (66 to 99 percent probability) but occasionally in uplands
Facultative	FAC	Equally likely to occur in wetland (34 to 66 percent probability) or non-wetland
Facultative upland	FACU	Usually occur in non-wetlands but occasionally found in wetlands
Obligate upland	UPL	Occur almost exclusively in non-wetlands
No indicator	NI	Inconclusive status

Hydrology

"The term 'wetland hydrology' encompasses all hydrologic characteristics of areas that are periodically inundated or have soils saturated to the surface at some time during the growing season. Areas with evident characteristics of wetland hydrology are those where the presence of water has an overriding influence on characteristics of vegetation and soils due to anaerobic reducing conditions, respectively" (Environmental Laboratory 1987).

Hydrologic characteristics must indicate that the ground is saturated to within 12 inches of the surface for at least 5 percent of the growing season during a normal rainfall year (approximately 18 days for most of low-lying southern California). Hydrology criteria are evaluated based on the characteristics listed below (Corps 2006). Where positive indicators of wetland hydrology are present, the limit of the OHWM (or the limit of adjacent wetlands) is noted and mapped. Evidence of wetland hydrology is met by the presence of a single primary indicator or two secondary indicators.

Primary

- surface water (A1)
- high water table (A2)
- saturation (A3)
- water marks (B1; non-riverine)
- sediment deposits (B2; non-riverine)
- drift deposits (B3; non-riverine)
- surface soil cracks (B6)
- inundation visible on aerial imagery (B7)
- water-stained leaves (B9)
- salt crust (B11)
- biotic crust (B12)
- aquatic invertebrates (B13)
- hydrogen sulfide odor (C1)
- oxidized rhizospheres along living roots (C3)
- Primary (continued)
- presence of reduced iron (C4)
- recent iron reduction in plowed soils (C8)

Secondary

- watermarks (B1; riverine)
- sediment deposits (B2; riverine)
- drift deposits (B3; riverine)
- drainage patterns (B10)
- dry-season water table (C2)
- thin muck surface (C7)
- crayfish burrows (C8)
- saturation visible on aerial imagery (C9)
- shallow aquitard (D3)
- FAC-neutral test (D5)

In the absence of all other hydrologic indicators and in the absence of significant modifications of an area's hydrologic function, positive hydric soil characteristics are assumed to indicate positive wetland hydrology. This assumption applies unless the site visit was done during the wet season of a normal or wetter-than-normal year. Under those circumstances, wetland hydrology would not be present.

Soils

"A hydric soil is a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (Natural Resource Conservation Service [NRCS] 2004).

Soils must exhibit physical and/or chemical characteristics indicative of permanent or periodic saturation. Soil matrix and mottle colors are identified at each sampling plot using a Munsell soil color chart (Kollmorgen 1994). Generally, an 18-inch or deeper pit is excavated with a shovel at each sampling plot unless refusal occurs above 18 inches.

Soils in each area are closely examined for hydric soil indicators, including the characteristics listed below. Hydric soil indicators are presented in three groups. Indicators for "All Soils" (A) are used in any soil regardless of texture, indicators for "Sandy Soils" (S) area used in soil layers with USDA textures of loamy fine sand or coarser, and indicators for "Loamy and Clayey Soils" (F) are used with soil layers of loamy very fine sand and finer (Corps 2006).

- histosols (A1)
- histic epipedons (A2)
- black histic (A3)
- sulfidic odor (A4)
- stratified layers (A5)
- 1 cm muck (A9)
- depleted below dark surface (A11)
- thick dark surface (A12)
- sandy mucky mineral (S1)
- sandy gleyed matrix (S4)

- sandy redox (S5)
- stripped matrix (S6)
- loamy mucky mineral (F1)
- loamy gleyed matrix (F2)
- depleted matrix (F3)
- redox dark surface (F6)
- depleted dark surface (F7)
- redox depressions (F8)
- vernal pools (F9)
- 2 cm muck (A10)
- reduced vertic (F18)
- red parent material (TF2; indicator is currently being tested by NRCS).

Hydric soils may be assumed to be present in plant communities that have complete dominance of obligate or facultative wetland species. In some cases, there is only inundation during the growing season and determination must be made by direct observation during that season, recorded hydrologic data, testimony of reliable persons, and/or indication on aerial photographs.

Non-wetland Waters of the U.S.

The non-wetland Waters of the U.S. designation is met when an area has periodic surface flows but lacks sufficient indicators to meet the hydrophytic vegetation and/or hydric soils criteria. For purposes of delineation and jurisdictional designation, the non-wetland Waters of the U.S. boundary in non-tidal areas is the OHWM as described in the Section 404 regulations (33 CFR Part 328).

USGS Mapping

The USGS Quad maps are one of the resources used to aid in the identification and mapping of jurisdictional areas. Their primary uses include understanding the subregional landscape position of a site, major topographical features, and a project's position in the watershed.

In our experience the designation of watercourse as a blue-line stream (intermittent or perennial) on USGS maps has been unreliable and typically overstates the hydrology of most streams. This has also been the experience of others, including the late Luna Leopold. Leopold was a hydrologist with USGS from 1952 to 1972, Professor in the Department of Geology and Geophysics, and Department of Landscape Architecture, University of California, Berkeley from 1972 to 1986, and Professor Emeritus from 1987 until his death in 2006. In regard to stream mapping on USGS maps, Dr. Leopold opined that ". . . blue lines on a map are drawn by nonprofessional, low-salaried personnel. In actual fact, they are drawn to fit a rather personalized aesthetic."

Appendix E

EXPLANATION OF STATUS CODES FOR PLANT AND ANIMAL SPECIES

Appendix E
EXPLANATION OF STATUS CODES FOR PLANT AND ANIMAL SPECIES

U.S. Fish and Wildlife Service (USFWS)

BCC Birds of Conservation Concern
FE Federally listed endangered
FT Federally listed threatened

California Department of Fish and Game (CDFW)

SE State listed endangered
ST State listed threatened
SSC State species of special concern

Multiple Species Habitat Conservation Plan (MSHCP) Covered

MSHCP Covered indicates that the species is part of a proposed list of species (146 total) considered at this time to be adequately conserved by the Western Riverside MSHCP, provided that participants meet all conditions listed in the Final MSHCP.

California Native Plant Society (CNPS) Codes

Lists

1A = Presumed extinct.

1B = Rare, threatened, or endangered in California and elsewhere. Eligible for state listing.

2 = Rare, threatened, or endangered in California but more common elsewhere. Eligible for state listing.

3 = Distribution, endangerment, ecology, and/or taxonomic information needed. Some eligible for state listing.

4 = A watch list for species of limited distribution. Needs monitoring for changes in population status. Few (if any) eligible for state listing.

List/Threat Code Extensions

.1 = Seriously endangered in California (over 80 percent of occurrences threatened/high degree and immediacy of threat)

.2 = Fairly endangered in California (20 to 80 percent occurrences threatened)

.3 = Not very endangered in California (less than 20 percent of occurrences threatened, or no current threats known)

A CA Endemic entry corresponds to those taxa that only occur in California.

All List 1A (presumed extinct in California) and some List 3 (need more information; a review list) plants lacking threat information receive no threat code extension. Threat Code guidelines represent only a starting point in threat level assessment. Other factors, such as habitat vulnerability and specificity, distribution, and condition of occurrences are considered in setting the Threat Code.

From: Barry Jones

Subject: Response to Comments Determination of Biologically Equivalent or Superior Preservation for San Gorgonio Crossings

HELIX Proj. No.: TSG-16

Message: The U.S. Fish and Wildlife Service and California Department of Fish and Wildlife (collectively "Resource Agencies") submitted comments to the County of Riverside on April 5, 2016, on the Determination of Biologically Equivalent or Superior Preservation (DBESP) for San Gorgonio Crossings project prepared by HELIX Environmental Planning, Inc. This memo addresses those comments. It is my understanding that the County will address comments 1 and 2 and these will not be addressed further here.

3. Pages 2 and 3 provide a complete description of the methods used to determine the limits of Riparian/Riverine resources on the site. The dates of the fieldwork are identified, the definition used to determine Riparian/Resources is provided, and as backup further information is provided on state and federal jurisdictional delineation methodologies are provided. It should be noted that the Riparian/Riverine mapping was provided as part of the pre-DBESP processing for the project, and was revised based on comments by the Resource Agencies prior to submittal of the DBESP. No additional information is required.

4. Figure 8 of the DBESP identifies the drainage and outfall that will collect flows from the Drainage "B" complex and release flows at the same location where those flows currently exit the site. Similarly, Drainage "A" is being conveyed through the mitigation channel along the southern end of the project before outletting offsite to the west at the same location that the flows currently exit the site.

5. The project will be conditioned to provide a more detailed mitigation plan for review and approval by the County prior to initiating project impacts. The information provided in the DBESP is adequate to determine that the mitigation as proposed will provide equivalent or superior preservation as required by the DBESP process.

I. INTRODUCTION

The purpose of this Determination of Biologically Equivalent or Superior Preservation (DBESP) analysis is to summarize the San Gorgonio Crossings project's compliance with the County of Riverside's (County's) Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP; Dudek and Associates [Dudek] 2003). The I-10 Gateway Job Center property is comprised of 7 Assessor Parcel Numbers (APNs): 407-220-004, -007, -008, -009, -014, -016, and -017. The project site is located within the Pass Area Plan of the MSHCP; however, it is not located within any Criteria Cell. This project has not yet received its U.S. Army Corps of Engineers (USACE) Section 404 Permit, California Department of Fish and Wildlife (CDFW) Streambed Alteration Agreement, or Regional Water Quality Control Board (RWQCB) Section 401 Water Quality Certification.

MSHCP Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools, states:

> The purpose of the procedures described in this section is to ensure that the biological functions and values of these areas throughout the MSHCP Plan Area are maintained such that Habitat values for species inside the MSHCP Conservation Area are maintained.

The emphasis is on conservation of habitats capable of supporting MSHCP Covered Species, particularly within the identified Conservation Area. For projects that propose impacts to Riparian/Riverine or vernal pool resources, a DBESP assessment must be completed to ensure that the proposed alternative provides for "replacement of any lost functions and values of Habitat as it relates to Covered Species." This DBESP analysis provides information necessary for the County to find that the project meets these objectives.

II. DEFINITION OF PROJECT AREA

The approximately 229.9-acre San Gorgonio Crossings property is located east of Interstate 10 (I-10) on the north side of Cherry Valley Boulevard in the northwestern portion of Riverside County, California (Figures 1 and 2). The property is situated on the U.S. Geological Survey (USGS) 7.5-minute El Casco quadrangle in the northern portion of Section 30, Township 2 South, Range 1 West (Figure 3).

The southern and central portions of the property consist of a broad, sloping grassland, with steep ridges and canyons occurring on the northern half of the site. Grazing and past active agriculture has disturbed much of the site, which is currently grazed by sheep and goats. Several dirt roads and trails traverse the site and extend off site to the north and east. A small horse ranch and I-10 occur to the southwest of the property, while the remains of a chicken ranch occur to the southeast. The remainder of the property is bordered by undeveloped land, with the exception of a few rural residences to the north. An aerial photograph of the project site is included as Figure 4.

Elevations on site range from approximately 2,400 to 2,690 feet above mean sea level. Overall, site drainage is to the west and southwest. Soils on site are primarily Hanford coarse sandy loam and terrace escarpments with Gorgonio gravelly loamy fine sand, Greenfield sandy loam, Hanford cobbly coarse sandy loam, and Ramona sandy loam (Knecht 1971).

III. PROJECT DESCRIPTION

The proposed project is for the construction of 2 large industrial buildings on approximately 145.6 acres of the property. The project includes detention basins, parking, landscaping, and other associated infrastructure. An additional 13.5 acres of offsite impacts resulting from infrastructure construction occur to the north of the site. The 2 industrial buildings will be designed to be eligible for Leadership in Energy and Environmental Design (LEED) Silver Certification. Building 1 will comprise approximately 811,000 square feet, and Building 2 approximately 1,012,760 square feet for a total of approximately 1,823,760 square feet of floor area. Additionally, the project includes the use of solar panels on roofs, with 23 percent of the project's power needs being provided by the on-site solar panels.

Existing drainage flows from offsite areas to the north would be conveyed through the site and would ultimately be conveyed offsite to the west side of the project site. As included in the Hydrology analysis for Tentative Parcel Map 36564, there are two drainage areas that exist onsite: Drainage area "A" and "B." The project includes a number of drainage facilities designed to safely convey the off-site 100-year storm runoffs through the project site, limit the storm flow resulting from project activities including: use of bio-treatment BMPs such as extended detention basins and trenches, sized to accommodate the first flush flows generated in the proposed development area; storm drain facilities that will collect and route onsite runoff through a detention basin that is sized to limit 10-year storm discharge from the site to be equal or less than flows under the existing condition; and a detention basin that will incorporate hydro modification requirements by limiting the increase in the 2-year storm flow caused by the proposed development to less than 10 percent more than existing conditions.

IV. METHODS

HELIX Environmental Planning, Inc. (HELIX) conducted a jurisdictional delineation in areas that were suspected to be jurisdictional wetlands and non-wetland waters of the U.S. (WUS) on January 27 and February 8, 2005. HELIX returned to the site on November 24, 2008 to update the jurisdictional mapping. An updated assessment was conducted by Larry Sward on September 17, 2012. The offsite study area was assessed by Larry Sward on October 22, 2013 (HELIX 2013). These surveys were the basis for the Riparian/Riverine and vernal pool habitats assessment, according to the MSHCP definition as follows:

- Riparian/Riverine areas are lands that contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or depend upon soil moisture from a nearby freshwater source; or areas with freshwater flow during all or a portion of the year.

- Vernal pools are seasonal wetlands that occur in depression areas that have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season, while upland species (annuals) may be dominant during the drier portion of the growing season. The determination that an area exhibits vernal pool characteristics and the definition of the watershed supporting vernal pool hydrology must be made on a case-by-case basis. Such determinations should consider the length of time the area exhibits upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. Evidence concerning the persistence of an area's wetness can be obtained from its history, vegetation, soils, and drainage characteristics, uses to which it has been subjected, and weather and hydrologic records.

- All areas with depressions, drainage channels, or wetland vegetation were evaluated for the presence of WUS, including jurisdictional wetlands and Riparian/Riverine resources. Each area was inspected according to the USACE' wetland delineation guidelines. USACE wetland boundaries were determined using 3 criteria (vegetation, hydrology, and soils) established for wetland delineations as described within the Wetlands Delineation Manual (Environmental Laboratory 1987). Other references included memoranda (Studt 1991; Williams 1992) that help clarify the wetlands manual. CDFW jurisdictional boundaries were determined based on the presence of any 1 of the 3 criteria being present.

Plants were identified according to Hickman, ed. (1993) and/or Roberts et al. (2004). Wetland affiliations of plant species follow the U.S. Fish and Wildlife Service's (USFWS's) Branch of Habitat Assessment (USFWS 1996). Soils information was taken from Knecht (1971) and hydric soil lists for the area (U.S. Department of Agriculture 1992). Soil chromas were identified according to Kollmorgen Instruments Corporation (1994).

The area was then determined to be a federal (USACE) wetland if it satisfied all 3 wetland criteria (vegetation, hydrology, and soil). Areas were determined to be non-wetland WUS if there was evidence of regular surface flow (e.g., bed and bank) but vegetation or soils criterion was not met. Jurisdictional limits for these areas were defined by the ordinary high water mark and measured, and the surrounding vegetation was noted.

Waters of the state (CDFW jurisdictional) boundaries were determined based on the presence of riparian vegetation or regular surface flow. Streambeds within CDFW jurisdiction were delineated based on the definition of streambed as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supporting fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports riparian vegetation" (Title 14, Section 1.72). Riparian habitat is not defined in Title 14, but the section refers to vegetation and habitat associated with a stream. Waters of the state include all riparian shrub or tree canopy that may extend beyond stream banks.

V. RIPARIAN/RIVERINE RESOURCES

A. RIPARIAN/RIVERINE HABITATS

The site contains streambed, mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral (including disturbed), non-native grassland, eucalyptus woodland, and disturbed habitat (Figure 5; Table 1). No vernal pools exist on site, and no vernal pool species are expected to occur.

Riparian/Riverine habitats occur on site as 2 main drainages that traverse the site from east to west and from northeast to southwest, in addition to a few other shorter, scattered drainages (Figure 6). All but 2 small areas of the on-site drainages are ephemeral and do not support wetland vegetation, and are considered Riverine and total 1.25 acres. The 2 small disturbed

wetland areas are considered Riparian and total 0.04 acre. An additional 0.12 acre of ephemeral drainage occurs in the offsite study area. The drainages are depicted in Figure 5 but are not presented in Table 1 as they were included as part of the vegetation communities they traverse. There is a total of 1.41 acres of Riparian/Riverine habitats.

B. JURISDICTIONAL HABITAT

As previously noted, a focused jurisdictional delineation was conducted in areas that were suspected to be jurisdictional wetlands and non-wetland WUS in January and February 2005 by HELIX. This delineation was updated in 2008 based on a site visit with USACE and RWQCB personnel. An updated assessment was conducted by Larry Sward on September 17, 2012. Ephemeral drainage/streambed occurs on site as 2 main drainages that traverse the site from east to west and from northeast to southwest, in addition to a few other shorter, scattered drainages (Figure 6). Widths of on-site drainages range from less than 1 foot to 15 feet. All on-site drainages are ephemeral and do not support wetland vegetation. These areas are regulated by the USACE as non-wetland WUS and by the CDFW as streambeds.

Mule fat scrub consists of a small, isolated stand of mule fat in the southeastern corner of the site. The soil in this area is not hydric and therefore did not meet USACE wetland criteria. Since this area is not associated with a drainage or pond, it was also determined not to be CDFW jurisdictional habitat. This area is also not considered Riparian/Riverine habitat under the MSHCP.

The WUS (USACE jurisdiction) is comprised of 0.46 acre of ephemeral drainage, of which 0.01 occurs in the offsite study area. The waters of the state (CDFW jurisdiction) consists of 1.40 acres, including 0.04 acre of disturbed wetland and 1.37 acres of streambed, which is subject CDFW regulation under California Fish and Game Code Sections 1600 through 1616. The 1.37 acres of streambed included 0.12 acre within the offsite study area.

C. RIPARIAN/RIVERINE AND VERNAL POOL SPECIES

The definition of Riparian/Riverine habitats is based on potential for the habitat to support Riparian/Riverine Covered Species, which are identified in MSHCP Section 6.1.2 and described below.

1. Plants

Twenty-four plant species are identified as potentially occurring in Riparian/Riverine and vernal pool habitats. Shrub and tree species such as California black walnut (*Juglans californica* var. *californica*), Engelmann oak (*Quercus engelmannii*), Coulter's matilija poppy (*Romneya coulteri*), and San Miguel savory (*Satureja chandleri*) would have been readily identifiable during project surveys but were not found on site. Several species, including spreading navarretia (*Navarretia fossalis*), California Orcutt grass (*Orcuttia californica*), prostrate navarretia (*Navarrettia prostrate*), San Diego button-celery (*Eryngium aristulatum* var. *parishii*), thread-leaved brodiaea (*Brodiaea filifolia*), Fish's milkwort (*Polygala cornuta* var. *fishiae*), lemon lily (*Lilium parryi*), ocellated Humboldt lily (*L. humboldtii* ssp. *ocellatum*), Mojave

tarplant (*Deinandra mohavensis*), Parish's meadowfoam (*Limnathes gracilis* var. *parishii*), and slender-horned spineflower (*Dodecahema leptoceras*) have distributions well outside of the study area. The remaining species have a distribution that includes the project area or occur in habitats found on site and are discussed in greater detail below.

The Santa Ana River woolly-star (*Eriastrum densifolium* spp. *sanctorum*) is found along the Santa Ana River in 2 locations and is restricted to open washes and early-successional alluvial fan scrub on open slopes above main watercourses, such as the Santa Ana River on fluvial deposits where flooding and scouring occur at a frequency that allows the persistence of open shrublands. No appropriate habitat occurs on site for the Santa Ana River woolly-star.

Suitable habitat for Brand's phacelia (*Phacelia stellaris*) includes coastal dunes and/or coastal scrub in sandy openings, sandy benches, dunes, sandy washes, or flood plains of rivers at elevations between 0 and 1,200 feet. Brand's phacelia is known from 2 locations on sandy terraces along the Santa Ana River (at Fairmont Park and along a horse trail in the Santa Ana Wilderness Area along the Santa Ana River). Given the highly disturbed nature of the site, this species is not expected to occur.

Graceful tarplant (*Holocarpha virgata* ssp. *elongata*) occurs in chaparral, cismontane woodland, coastal sage scrub, and valley and foothill grasslands below 1,900 feet (California Native Plant Society [CNPS] 2013). This species would not be expected to occur on site because the site's elevation is higher than the known range for this species.

Mud nama (*Nama stenocarpum*) is restricted to muddy embankments of marshes and swamps and within lake margins and riverbanks (CNPS 2013). Three populations are known from Riverside County, with 2 occurring along the San Jacinto River (Dudek 2003). No appropriate habitat occurs on site.

Orcutt's brodiaea (*Brodiaea orcuttii*) occurs in clay soils in mesic native and non-native grasslands that often include vernal pools as well as moist meadows and along stream courses at higher elevations (Reiser 2001; CNPS 2013). The core population in Riverside County is the Santa Rosa Plateau (Dudek 2003). No clay soils are present on site.

San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*) is restricted to grassland, playas, and vernal pools with alkali soils (Dudek 2003). This species typically occurs on the margins of areas subject to short-term inundation and does not develop in areas that support regular long-term ponding or flooding. No alkali soils or appropriate habitat occurs on site.

Smooth tarplant (*Centromadia pungens*) is found in southwestern California and northwestern Baja California, Mexico (Baja), and occurs in San Bernardino, Riverside, and San Diego counties. This species occurs in a variety of habitats, including alkali scrub and playas, riparian woodland, watercourses, and grasslands with alkaline affinities (Dudek 2003; CNPS 2013). No alkali soils are present on site.

Vernal barley (*Hordeum intercedens*) occurs in grassland, vernal pools, and vernal playas and is restricted to clay and alkaline, silty-clay soils in Riverside County (Dudek 2003). Twelve populations are known from Riverside County along the San Jacinto River and Salt Creek. No appropriate soils occur on site.

2. Animals

Invertebrates

Vernal pool fairy shrimp (*Branchinecta lynchi*) occurs throughout the Central Valley and in several disjunct populations in Riverside County. This species exists in vernal pools and other ephemeral basins, often located in patches of grassland and agriculture interspersed in Diegan coastal sage scrub and chaparral. Riverside fairy shrimp (*Streptocephalus woottoni*) occurs in Riverside, Orange, and San Diego counties as well as in northern Baja. This species is typically found in deeper vernal pools and other ephemeral basins that hold water for long periods of time (30 or more days). Santa Rosa Plateau fairy shrimp (*Linderiella santarosae*) are limited to the Santa Rosa Plateau. No vernal pools or ephemeral basins occur on site and none of the four sensitive fairy shrimp species is expected to occur.

Fish

The Santa Ana sucker (*Catastomus santaanae*) is restricted to the Santa Ana River watershed with year-round flows. No appropriate habitat occurs on site.

Amphibians

No appropriate habitat for the 3 amphibian species (arroyo toad [*Bufo californicus*], mountain yellow-legged frog [*Rana muscosa*], or California red-legged frog [*Rana aurora draytonii*]) listed under MSHCP 6.1.2 occurs on site, and none of these species has any potential to occur on site.

Birds

The least Bell's vireo (*Vireo bellii pusillus*) is found in riparian scrub, forest, and woodland habitats that typically feature dense cover within 1 to 2 meters of the ground and a dense, stratified canopy. It inhabits low, dense riparian growth along water or dry parts of intermittent streams. Typically, the vireo is associated with southern willow scrub, cottonwood forest, mule fat scrub, sycamore alluvial woodland, coast live oak riparian forest, arroyo willow riparian forest, wild blackberry, or mesquite in desert localities. It uses habitat limited to the immediate vicinity of water. The vireo primarily nests in vegetation typically dominated by willows and mule fat but may also use a variety of shrubs, trees, and vines. There is no suitable habitat on site to support the vireo.

The southwestern willow flycatcher (*Empidonax traillii extimus*) is restricted to riparian woodlands along streams and rivers with mature, dense stands of willows, cottonwoods (*Populus* spp.), or smaller spring fed or boggy areas with willows or alders (*Alnus* spp.). It breeds in

relatively dense riparian habitats. There is no riparian woodland present on site; therefore, there is no suitable habitat to support the flycatcher.

The western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) requires dense, wide riparian woodlands with well-developed understories for breeding. It occurs in densely foliaged, deciduous trees and shrubs, especially willows that are required for roost and nest sites. When breeding, the cuckoo is restricted to river bottoms and other mesic habitats where humidity is high and where dense understory abuts slow-moving watercourses, backwaters, or seeps. Willow is almost always a dominant component of the vegetation. There is no suitable habitat on site to support the cuckoo.

Both the bald eagle (*Haliaeetus leucocephalus*) and peregrine falcon (*Falco peregrinus*) occur primarily in and adjacent to open water habitats, with the falcon possibly occurring in riparian areas. No suitable habitat occurs on site.

VI. IMPACTS

A. RIPARIAN/RIVERINE AND VERNAL POOL HABITATS

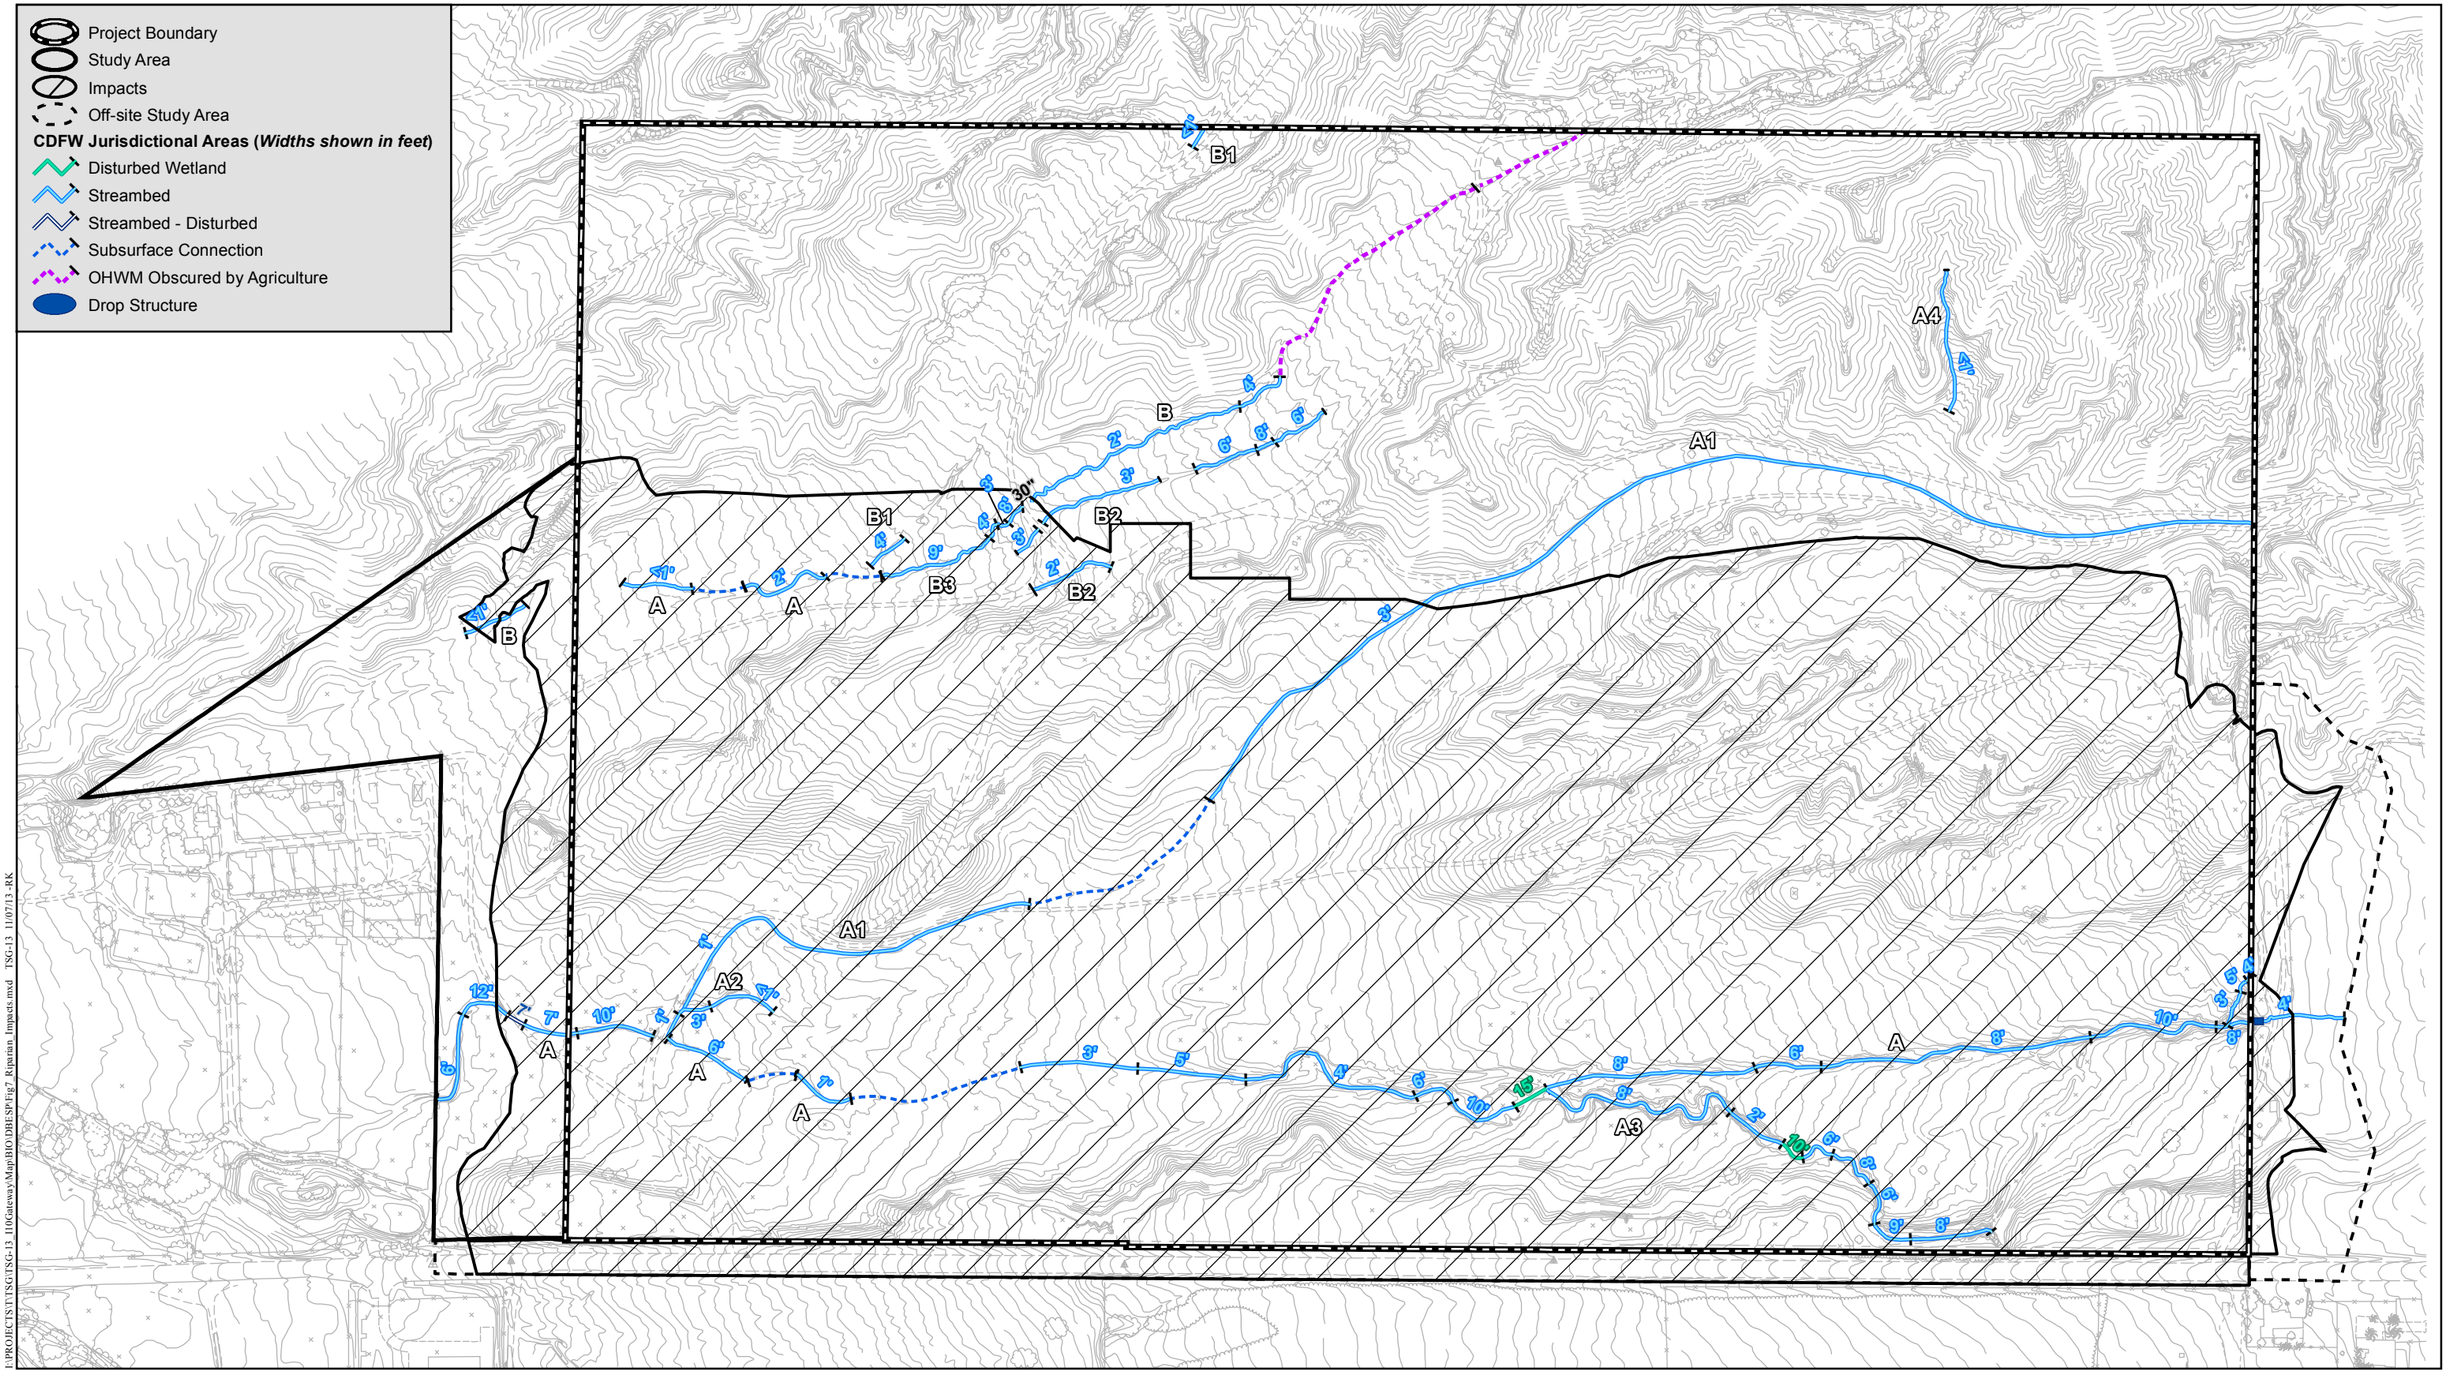
As described above, the emphasis of the MSHCP's Riparian/Riverine and vernal pool policy is on conservation of habitats capable of supporting MSHCP Covered Species. The goal of the DBESP process is to determine if the project has in fact provided for a project alternative that results in biologically equivalent or superior preservation. The first priority for Riparian/Riverine habitats that have potential to contribute to the biological values of the MSHCP preserve is avoidance of direct impacts. The proposed project would impact approximately 1.07 acre of streambed habitat considered Riverine and 0.04 acre of disturbed wetland that is considered Riparian (Figure 7) that does not support Riparian/Riverine target species and does not contribute substantially to the on-site biological values of the MSHCP because the project site is outside of any Criteria Cells and is not targeted for conservation. The functions of the unvegetated Riverine streams and disturbed wetland on the property are primarily water conveyance, sediment transport, and energy dissipation (hydrologic regime and flood attenuation).

B. RIPARIAN/RIVERINE COVERED SPECIES

None of the species covered under Section 6.1.2 has any potential to occur on the project site; however, the drainages on the site are considered Riverine and the disturbed wetland is considered Riparian as these are tributary to downstream resources with potential to support sensitive riparian species.

C. JURISDICTIONAL HABITAT

The USACE, CDFW, and RWQCB regulate a project's effects on aquatic resources. As noted above, a focused jurisdictional delineation was conducted in areas that were suspected to be



F:\PROJECTS\TTSG\TSG-13_110Gateway\Map\BIO\DBH\SPFig7_Riparian_Impacts.mxd TSG-13 11/07/13 -RK

Riparian/Riverine Areas and Impacts

SAN GORGONIO CROSSINGS

HELIX Environmental Planning

Figure 7

CVAR_09493

jurisdictional wetlands and non-wetland WUS in January and February 2005 and November 2008, and updated in September 2012 by HELIX.

The Riverine habitat that would be impacted by the project consists of unvegetated, ephemeral drainages that traverse the property east to west. Total impacts include 0.40 acre of USACE and 1.11 acre of CDFW (including the 0.40 acres of USACE jurisdictional area) jurisdictional streambed.

The project will need to obtain an Individual Permit under Section 404 of the Clean Water Act. A Water Quality Certification application will need to be submitted to the RWQCB in compliance with Section 401 of the Clean Water Act. A Section 1602 Streambed Alteration Agreement request will need to be submitted to the CDFW for project effects on waters of the state.

VII. AVOIDANCE AND MITIGATION

A. AVOIDANCE

MSHCP Section 6.1.2 states:

> The purpose of the procedures described in this section is to ensure that the biological functions and values of these areas throughout the MSHCP Plan Area are maintained such that Habitat values for species inside the MSHCP Conservation Area are maintained.

The first priority for Riparian/Riverine habitats within Cell Criteria areas that have potential to contribute to MSHCP preserve biological values is avoidance of direct impacts.

The MSHCP states that:

> [f]or identified and mapped resources not necessary for inclusion in the MSHCP Conservation Area, applicable mitigation under California Environmental Quality Act (CEQA), which may include federal and state regulatory standards related to wetland functions and values, will be imposed by the Permittees. To ensure that these standards are met, Permittees shall ensure that, through the CEQA process, project applicants develop project alternatives demonstrating efforts that first avoid, and then minimize direct and indirect effects to the mapped wetlands and shall review these alternatives with the Permittee. An avoidance alternative shall be selected, if feasible. If an avoidance alternative is selected, measures shall be incorporated into the project design to ensure the long-term conservation of the areas to be avoided.
>
> If an avoidance alternative is not feasible, a practicable alternative that minimizes direct and indirect effects to Riparian/Riverine areas and vernal pools and associated functions and values to the greatest extent possible shall be selected.

> Those impacts that are unavoidable shall be mitigated such that the lost functions and values as they relate to Covered Species are replaced as set forth below under the Determination of Biologically Equivalent or Superior Preservation.

The first priority for sensitive habitats under the CEQA and under the MSHCP is avoidance of direct impacts. The proposed land use requires large pads that cannot be effectively reshaped to avoid Riverine and limited Riparian resources. Complete avoidance of the Riverine and limited Riparian resources would eliminate the viability of the development on the site because of the distribution of the drainages across the site. Total avoidance can be achieved only by minimal or no project alternatives, which render the project infeasible.

The current project does avoid impacts to the Riparian/Riverine resources in the northwestern portion of the site. Impacts to 0.30 acre (23 percent) of the Riverine resources have been avoided to the maximum extent practicable.

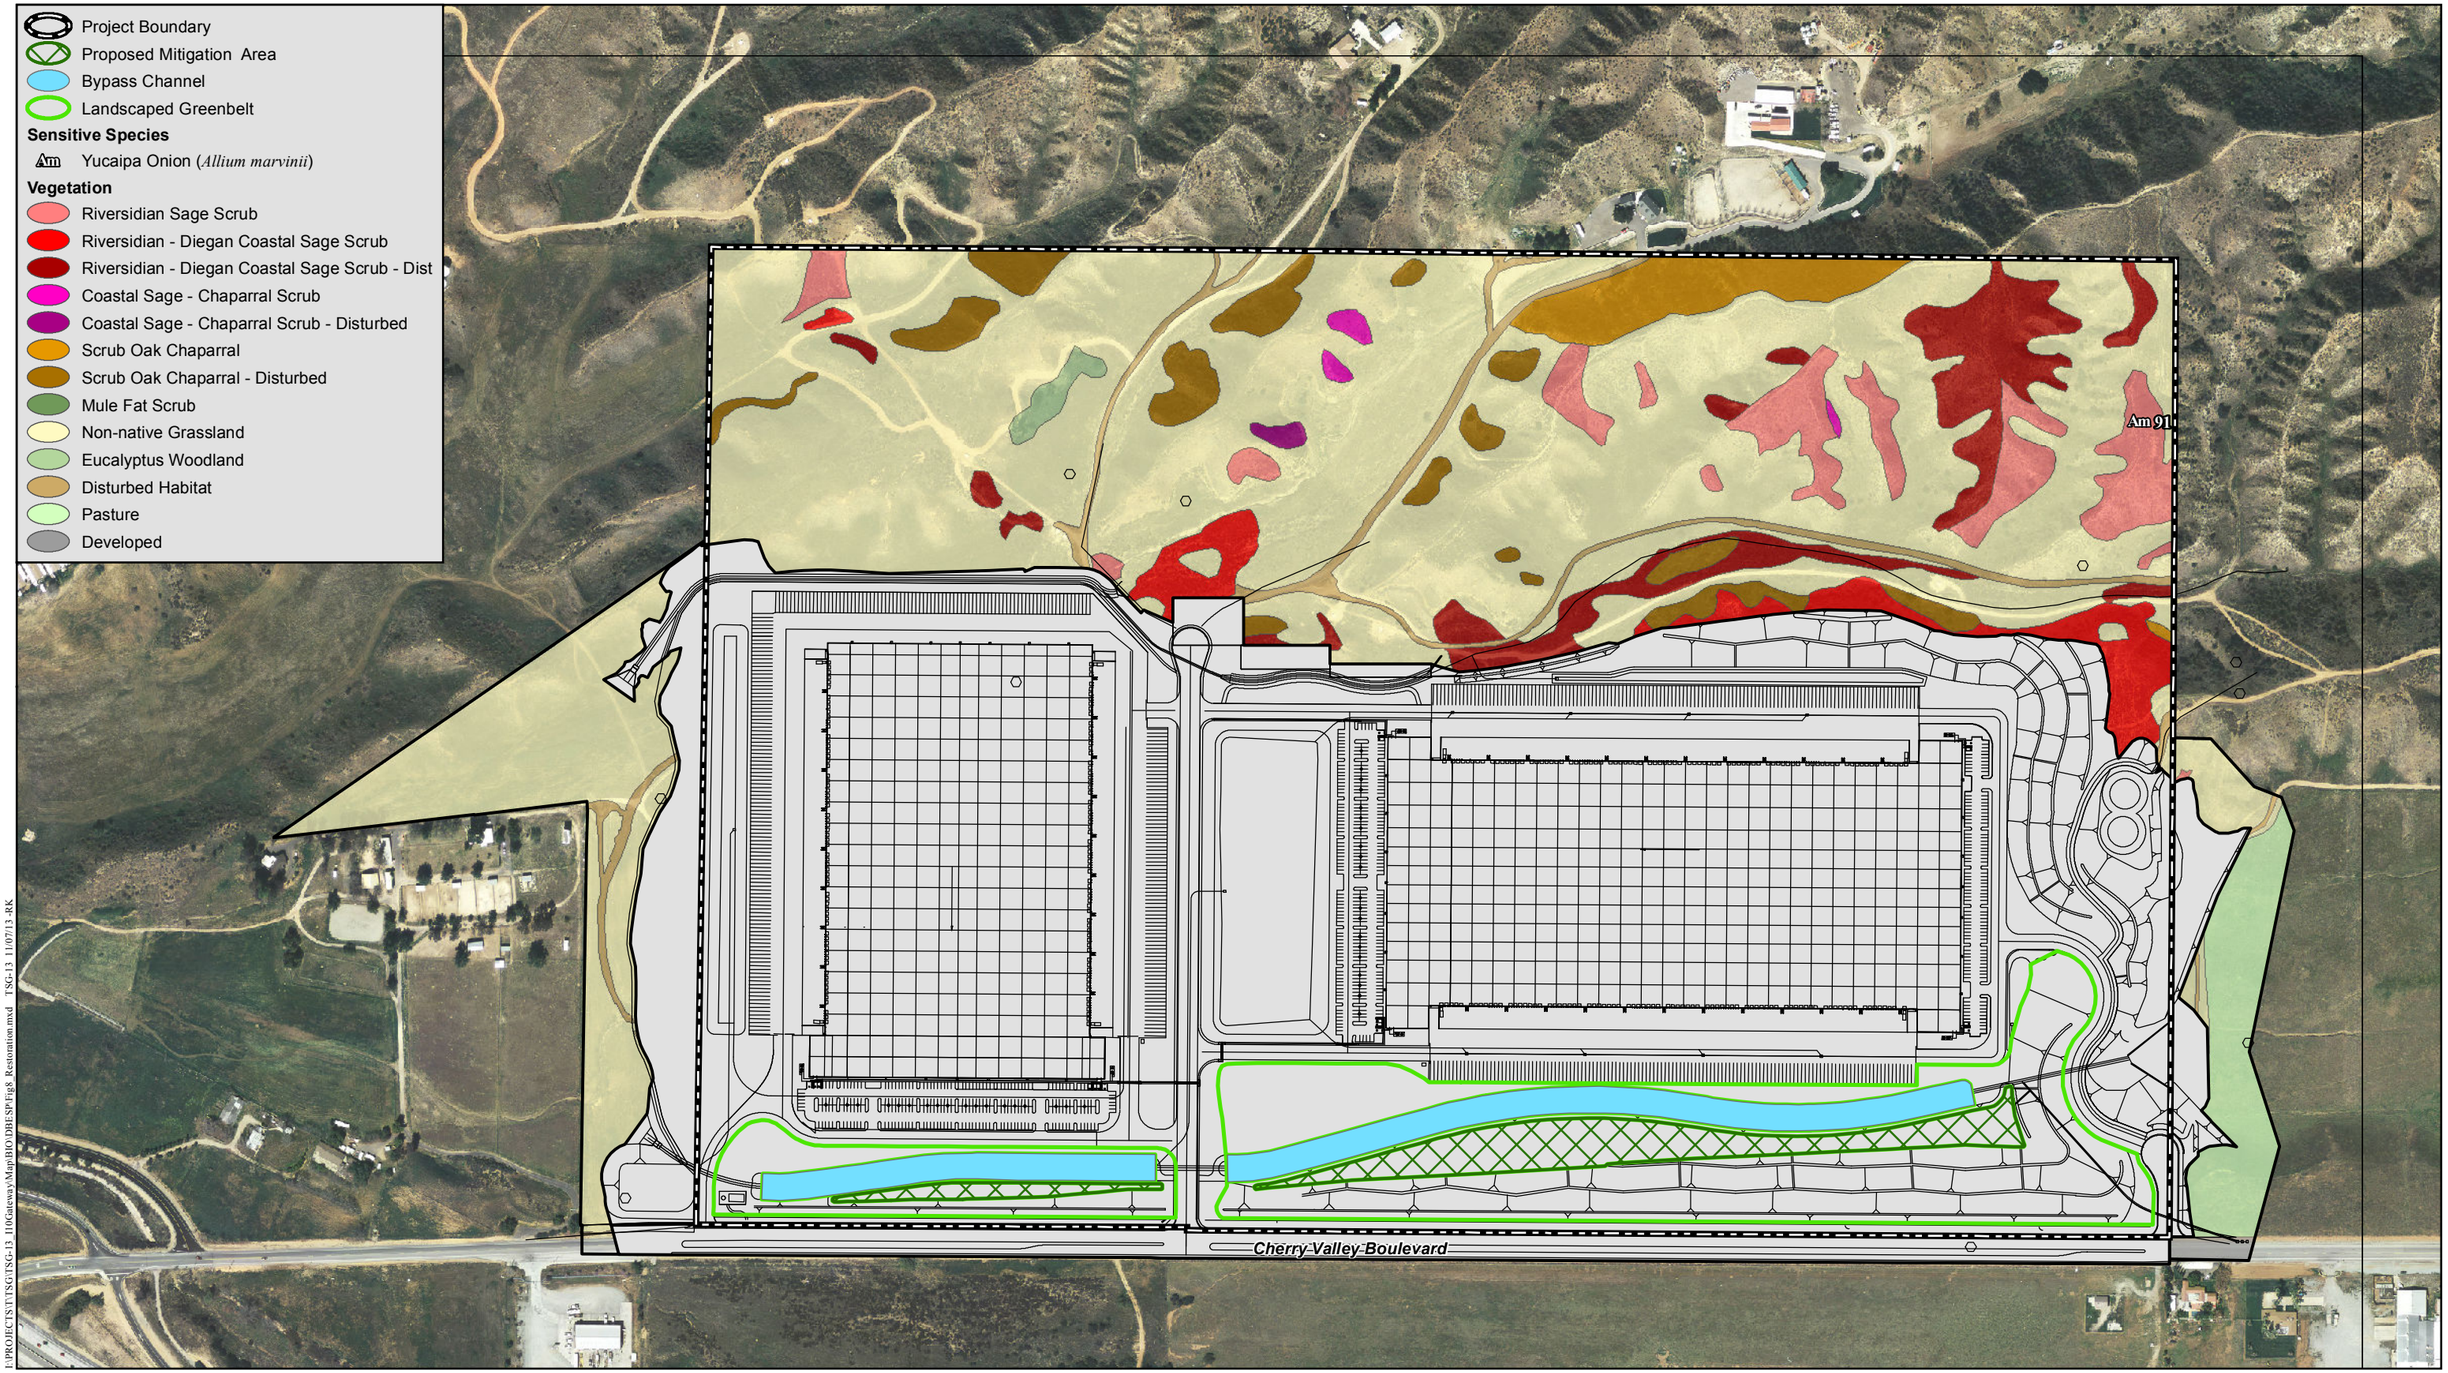
B. MITIGATION

Mitigation measures that would result in equivalent or superior preservation of the functions and values of riverine resources impacted by the project are shown here. Minimization measures for the proposed project will include the use of standard Best Management Practices (BMPs) to minimize the impacts during construction. Equipment will be stored in upland areas, outside of drainages except as required by project design (restoration, trash removal, etc.). Removal of trash located throughout the property will decrease the potential of pollutants entering the Riparian/Riverine areas downstream. The removal of the pollutants will increase the functions and values of the Riparian/Riverine areas proposed to be restored, thus replacing a portion of functions and values that will be lost within the project footprint.

Source control and treatment control BMPs will be implemented to minimize the potential contaminants that generated during and post construction. Source control BMPs include landscape planning, roof runoff controls, trash storage areas, use of alternative building materials, and education of future tenants. Treatment control BMPs include detention basins, vegetated swales (bio-swales), drain inlets, and vegetated buffers. The water quality BMPs will be implemented throughout the project to capture and treat contaminants.

To meet the criteria of a biologically equivalent or superior alternative, the applicant will offset impacts to Riverine resources through on-site creation at a 2:1 ratio for the 1.11 acres of impacts to Riverine and limited Riparian resources. In total, the proposed mitigation will result in 2.22 acres of Riparian and Riverine habitat creation/restoration.

The on-site creation of 2.22 acres of Riparian and Riverine habitat will occur at 2 locations on site along the southern boundary (Figure 8). The mitigation areas will receive all upstream flows up to 100 cubic feet per second (CFS). Flows above 100 CFS will bypass the mitigation area in a concrete-lined channel that will outlet at the eastern edge of the project. Flows up to 100 CFS will allow for creation of a braided streambed similar to the drainages that are being impacted. These areas will be revegetated with primarily floodplain scrub vegetation. Scattered pockets of mule fat scrub will also be planted to increase vegetative diversity. Combined, these areas will



I:\PROJECTS\TSG\TSG-13_1106Gateway\Map\BIO\DBESP\Fig8_Restoration.mxd TSG-13 11/07/13 -RK

Vegetation, Impacts, and Riparian Mitigation Area

Figure 8

CVAR_09496

offset losses of Riparian/Riverine functions and values by providing high quality Riparian/Riverine habitat, and provide for other functions and services such as water quality benefits, groundwater recharge, and nutrient cycling. A detailed restoration plan for the on-site mitigation sites will be prepared and submitted to the County for review and approval prior to implementation of the restoration effort.

The on-site mitigation would meet the definition of a Biologically Equivalent Preservation Alternative consistent with MSHCP Section 6.1.2.

VIII. CONCLUSION

The project is being implemented consistent with MSHCP Section 6.1.2 based on the following:

- Avoidance of the 100 percent of the unvegetated streambeds is not considered feasible as the project requires the use of large pads that cannot be reshaped; and

- Mitigation for direct impacts would occur through creation of Riparian/Riverine habitat on site.

Based on this DBESP assessment, the project is consistent with MSHCP Section 6.1.2.

IX. CERTIFICATION/QUALIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this biological evaluation, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

1.0 INTRODUCTION

The purpose of this report is to summarize the biological data on TSG Cherry Valley, LP's San Gorgonio Crossings project site for consistency with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP; Dudek and Associates [Dudek] 2003). The San Gorgonio Crossings property is comprised of seven Assessor's Parcel Numbers (APNs): 407-220-004, -007, -008, -009, -014, -016, and -017. The project site is located within the Pass Area Plan of the MSHCP; however, it is not located within any Criteria Cell. Because the project lies outside of any Cell Criteria areas, the project is not subject to Joint Project Review (JPR).

1.1 SITE LOCATION AND DESCRIPTION

The approximately 229-acre San Gorgonio Crossings property is located east of Interstate 10 (I-10) on the north side of Cherry Valley Boulevard in the northwestern portion of Riverside County, California (Figures 1 and 2). The property is situated on the U.S. Geological Survey (USGS) 7.5-minute El Casco quadrangle in the northern portion of Section 30, Township 2 South, Range 1 West (Figure 3).

The southern and central portions of the property consist of a broad, sloping grassland, with steep ridges and canyons occurring on the northern half of the site. Grazing and past active agriculture has disturbed much of the site, which is currently grazed by sheep and goats. Several dirt roads and trails traverse the site and extend off site to the north and east. A small horse ranch and I-10 occur to the southwest of the property, while the remains of a chicken ranch occur to the southeast. The remainder of the property is bordered by undeveloped land, with the exception of a few rural residences to the north. An aerial photograph of the project site is included as Figure 4.

Elevations on site range from approximately 2,400 to 2,690 feet above mean sea level. Overall, site drainage is to the west and southwest. Soils on site are primarily Hanford coarse sandy loam and terrace escarpments with Gorgonio gravelly loamy fine sand, Greenfield sandy loam, Hanford cobbly coarse sandy loam, and Ramona sandy loam (Knecht 1971).

1.2 PROJECT DESCRIPTION

The proposed project is for the construction of 2 large industrial buildings on approximately 145.6 acres of the property. The project includes detention basins, parking, landscaping, and other associated infrastructure. The 2 industrial buildings will be designed to be eligible for Leadership in Energy and Environmental Design (LEED) Silver Certification. Building 1 will comprise approximately 811,000 square feet, and Building 2 will comprise approximately 1,012,760 square feet for a total of approximately 1,823,760 square feet of floor area. Additionally, the project includes the use of solar panels on roofs, with 23 percent of the project's power needs being provided by the on-site solar panels.

Existing drainage flows from offsite areas to the north would be conveyed through the site and would ultimately be conveyed offsite to the west side of the project site. As included in the

Hydrology analysis for Tentative Parcel Map 36564, there are two drainage areas that exist onsite: Drainage area "A" and "B." The project includes a number of drainage facilities designed to safely convey the off-site 100-year storm runoffs through the project site, limit the storm flow resulting from project activities including: use of bio-treatment BMPs such as extended detention basins and trenches, sized to accommodate the first flush flows generated in the proposed development area; storm drain facilities that will collect and route onsite runoff through a detention basin that is sized to limit 10-year storm discharge from the site to be equal or less than flows under the existing condition; and a detention basin that will incorporate hydro modification requirements by limiting the increase in the 2-year storm flow caused by the proposed development to less than 10 percent more than existing conditions.

Refer to Appendix A for a compilation of project information, including RCIP summaries, Biological Report Summary Sheet, and Level of Significance Checklist.

2.0 WESTERN RIVERSIDE MULTIPLE SPECIES HABITAT CONSERVATION PLAN

The MSHCP is a comprehensive multi-jurisdictional effort that includes Riverside County and 14 cities in western Riverside County. Rather than address sensitive species on an individual basis, the MSHCP focuses on the conservation of 146 species, proposing a reserve system of approximately 500,000 acres and a mechanism to fund and implement the reserve system (Dudek 2003). Most importantly, the MSHCP allows participating entities to issue take permits for listed species so that individual applicants need not seek their own permits from the U.S. Fish and Wildlife Service (USFWS) and/or California Department of Fish and Wildlife (CDFW, formerly California Department of Fish and Game [CDFG]). The MSHCP was adopted on June 17, 2003 by the Riverside County Board of Supervisors. The Incidental Take Permit was issued by both the USFWS and CDFW on June 22, 2004. As this property is in unincorporated Riverside County, the County of Riverside (County) is the lead agency/permittee.

The MSHCP is implemented by the Western Riverside County Regional Conservation Authority (RCA). As noted, JPR is not required because the project lies outside of any Criteria Cells (Figure 5). Because there are impacts to Riverine resources, however, the RCA will process a Determination of Biologically Equivalent or Superior Preservation (DBESP) analysis.

3.0 METHODS

Prior to conducting field surveys, HELIX Environmental Planning, Inc. (HELIX) conducted a review of the MSHCP to determine which biological surveys would be required for the project site. Additionally, HELIX reviewed the MSHCP to determine what, if any, conservation requirements were applicable to the property.

CVAR_09517

3.1 VEGETATION MAPPING

Vegetation communities were mapped on a 1"=400' scale aerial photograph. Vegetation was classified and mapped according to the County's biological resource mapping requirements.

3.2 SENSITIVE PLANTS

The MSHCP has designated certain areas as requiring surveys for sensitive plant. The property occurs within Narrow Endemic Plant Species Survey Area (NEPSSA) 8. HELIX conducted focused surveys for NEPSSA Area 8 plants, Yucaipa (Marvin's) onion (*Allium marvinii*) and many-stemmed dudleya (*Dudleya multicaulis*), in accordance with the requirements of the MSHCP. Surveys for Yucaipa onion and many-stemmed dudleya were conducted by HELIX biologists on May 27, 2005 during the flowering period of sensitive plants with potential to occur. The soil survey for the western Riverside area (Knecht 1971) was reviewed to determine if clay soils were mapped on site as the target plant species prefer clay soil habitats. Surveys were focused on areas of potential habitat within the site: clay soil openings in chaparral (for Yucaipa onion) and clay/cobbly soil openings within chaparral, coastal sage scrub, and grassland. Surveys were performed by systematically walking transects of the entire site.

3.3 BURROWING OWL

The site is within the MSHCP Burrowing Owl Survey Area. Winter season burrowing owl (*Athene cunicularia*) surveys were conducted in early 2005, and breeding season burrowing owl surveys were conducted in June 2005 (HELIX 2005), April-May 2007 (HELIX 2007), and in August 2008 (HELIX 2008; Appendix B). The 2005 surveys were conducted in accordance with the CDFW field protocol (California Department of Fish and Game [CDFG] 1995); 2007 and 2008 surveys were conducted according to MSHCP Burrowing Owl Survey Guidelines (County 2006). The survey area consisted of the entire project site where potential habitat for owls existed. The biologist walked slowly and methodically along transects no farther than 30 meters apart on all potential burrowing habitat that occurs on site, and closely checked areas that met basic owl habitat requirements. All burrows were inspected for indications of recent owl occupation. A 500-foot buffer zone was surveyed visually where potential burrowing owl habitat bordered the property.

3.4 RIPARIAN/RIVERINE RESOURCES

A focused jurisdictional delineation and an MSHCP Riparian/Riverine assessment were conducted in areas that were suspected to be jurisdictional wetlands and non-wetland Waters of the U.S. (WUS) on January 27 and February 8, 2005 by HELIX. This delineation was updated in 2008 based on a site visit with U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board personnel (HELIX 2009b). An updated assessment was conducted by HELIX biologist Larry Sward on September 17, 2012. Prior to beginning fieldwork, aerial photographs (1"=400' scale) and 100-scale color orthophoto topo prepared specifically for this purpose, topographic maps (1"=100' scale), and USGS topographical maps were reviewed by HELIX to determine the location of potential jurisdictional and/or Riparian/Riverine areas that could be impacted by the project. All areas with depressions or drainage channels were evaluated for the presence of WUS, including jurisdictional wetlands. Each area was inspected

according to the USACE wetland delineation guidelines. USACE wetland boundaries were determined using three criteria (vegetation, hydrology, and soils) established for wetland delineations as described within the Wetlands Delineation Manual (Environmental Laboratory 1987). CDFW jurisdictional (Waters of the State) boundaries were determined based on the presence of any one of the three criteria being present.

Areas were assessed to determine if Riparian/Riverine or vernal pool habitats are present on site (HELIX 2009a), consistent with Section 6.1.2 of the MSHCP. The Riparian/Riverine and vernal pool assessment was conducted according to the following MSHCP definitions:

- Riparian/Riverine areas are lands that contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or depend upon soil moisture from a nearby freshwater source; or areas with freshwater flow during all or a portion of the year; and

- Vernal pools are seasonal wetlands that occur in depression areas that have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the wetter portion of the growing season, while upland species (annuals) may be dominant during the drier portion of the growing season. The determination that an area exhibits vernal pool characteristics and the definition of the watershed supporting vernal pool hydrology must be made on a case-by-case basis. Such determinations should consider the length of time the area exhibits upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. Evidence concerning the persistence of an area's wetness can be obtained from its history, vegetation, soils, drainage characteristics, uses to which it has been subjected, and weather and hydrologic records.

3.5 NOMENCLATURE

Nomenclature used in this report follows the conventions used in the MSHCP. Vegetation community classifications follow the vegetation communities shown in Section 2.1.3 of the MSHCP (Dudek 2003) and Holland (1986). Latin names of plants follow Hickman, ed. (1993), while common names follow Hickman or the California Native Plant Society (CNPS; 2012). Sensitive plant status follows the CDFW California Natural Diversity Data Base (CNDDB; CDFG 2012). Animal nomenclature used in this report is taken from Collins and Taggart (2009) for amphibians and reptiles, the American Ornithologists' Union (2008) for birds, and Baker et al. (2003) for mammals. Sensitive animal status follows the CNDDB (CDFG 2011).

4.0 RESULTS

The southern and central portions of the property consist of broad, sloping grassland, with steep ridges and canyons occurring on the northern half of the site. The northern and western portions of the property were affected by fire between 2007 and 2008. The larger scrub and trees were

affected by the fire although most remain and are recovering. Following is a summary of resources mapped on the site.

4.1 VEGETATION COMMUNITIES

Vegetation communities mapped on site include streambed, mule fat scrub, Riversidean sage scrub, Riversidean-Diegan coastal sage scrub (including disturbed), coastal sage-chaparral scrub (including disturbed), scrub oak chaparral, non-native grassland, exotic (eucalyptus woodland), and disturbed habitat. Developed areas along Cherry Valley Boulevard occur within off-site impact areas (Figure 6; Table 1).

4.1.1 Mule Fat Scrub

Mule fat scrub is a depauperate, shrubby riparian scrub community dominated by mule fat (*Baccharis salicifolia*) and interspersed with shrubby willows (*Salix* spp.). This habitat generally occurs along intermittent stream channels with a fairly coarse substrate and moderate depth to the water table (Holland 1986). It consists of a small (0.06 acre), isolated stand in the southeastern corner of the site.

4.1.2 Riversidean Sage Scrub

Riversidean sage scrub occupies xeric sites such as steep slopes, severely drained soils, or clays that slowly release stored soil moisture. It is dominated by sub-shrubs with leaves that are deciduous during drought, an adaptation that allows the habitat to withstand the prolonged drought period in the summer and fall. Sage scrub species have relatively shallow root systems and open canopies that allow for the occurrence of a substantial herbaceous (annual plant) component. Typical stands are fairly open and dominated by species such as coastal sagebrush (*Artemisia californica*), brittlebush (*Encelia farinosa*), and flat-topped buckwheat (*Eriogonum fasciculatum*; Holland 1986). This habitat type occurs mainly in the eastern portions of the site and is dominated by brittlebush, rosemary flat-topped buckwheat (*Eriogonum fasciculatum* ssp. *polifolium*), and coastal sagebrush. Other species present include deerweed (*Lotus scoparius*), filarees (*Erodium* spp.), black and white sage (*Salvia mellifera* and *S. apiana*), California buckwheat (*Eriogonum fasciculatum* ssp. *fasciculatum*), and non-native grasses. A total of 7.7 acres of this habitat occurs on the site.

4.1.3 Riversidean-Diegan Coastal Sage Scrub (including disturbed)

This habitat type is a mix of both Riversidean and Diegan coastal sage scrubs, both of which occupy low-moisture sites and are dominated by drought-deciduous sub-shrubs (Holland 1986). This habitat type is found mainly in the central portions of the site and totals approximately 17.7 acres. It is generally taller and comprised of greater percentages of coastal sagebrush and flat-topped buckwheat than the pure Riversidean sage scrub habitat. Other species present include California encelia (*Encelia californica*), black sage, deerweed, and non-native grasses. Disturbed portions totaling approximately 10.1 acres consist of sparse shrub cover and a high percentage of non-native grasses and forbs. An additional 0.1 acre of Riversidean-Diegan coastal sage scrub occurs within the off-site impact area.

4.1.4 Coastal Sage-Chaparral Scrub (including disturbed)

Areas of shrub habitat occur on site that contain a mix of sage scrub and chaparral species. Three small pockets of this habitat type totaling 0.3 acre occur in the northern portion of the site and consist of chamise (*Adenostoma fasciculatum*), coastal sagebrush, black sage, and various grasses. A 0.2-acre patch of disturbed coastal sage-chaparral scrub occurs in the north-central portion of the property.

Vegetation Map

SAN GORGONIO CROSSINGS

HELIX Environmental Planning

0 400 Feet

Figure 6

CVAR_09522

4.1.5 Scrub Oak Chaparral (including disturbed)

Scrub oak chaparral is a dense evergreen chaparral that can grow to 20 feet tall. It is dominated by scrub oak (*Quercus berberidifolia*) at this location. Most of the scrub oak chaparral on site is fairly open, and numerous trees exhibit stress, possibly from past drought conditions; these areas of sparse shrubs were identified as disturbed. This habitat is found on the slope adjacent to Cherry Valley Boulevard and other slopes throughout the site. Approximately 2.9 acres of scrub oak chaparral and 9.8 acres of disturbed scrub oak chaparral occur on the site. Species occurring include scrub oak, spiny redberry (*Rhamnus crocea*), sugar bush (*Rhus ovata*), miner's lettuce (*Claytonia perfoliata*), fiesta flower (*Pholistoma racemosum*), black sage, American bowlesia (*Bowlesia incana*), and wild cucumber (*Marah macrocarpa*).

4.1.6 Non-native Grassland

Non-native grassland contains annual grasses of varying cover and is often associated with showy-flowered, native annual forbs. This association occurs on gradual slopes with deep, fine-textured, usually clay soils (Holland 1986). This is the dominant habitat type on site and the off-site grading areas, totaling 173.1 acres. Species present include ripgut grass (*Bromus diandrus*), foxtail chess (*B. madritensis* ssp. *rubens*), Mediterranean grass (*Schismus barbatus*), rancher's fiddleneck (*Amsinckia intermedia*), horehound (*Marrubium vulgare*), and filaree. An additional 4.2 acres of non-native grassland occurs within the off-site impact area.

4.1.7 Exotic (Eucalyptus Woodland)

Eucalyptus woodlands were first established in California in the late 1800s and have since been planted extensively for wind blocks, ornamentals, and hardwood production. Most groves are monotypic, with the most common species being either blue gum (Eucalyptus globulus) or red gum (E. globulus) eucalyptus. The understory within well-established groves is usually very sparse due to the closed canopy and allelopathic nature of the leaf litter. As a wildlife habitat, these woodlands provide excellent nesting sites for a variety of raptors, including golden eagles. During winter migrations, a large variety of warblers may be found feeding on the insects attracted to eucalyptus flowers. The sparse understory offers only limited wildlife habitats. This habitat occurs on site as two stands in the northwestern portion of the property and totals approximately 0.6 acre.

4.1.8 Disturbed Habitat

Disturbed habitat includes unvegetated or sparsely vegetated areas, particularly where the soil has been heavily compacted by either vehicles (roads) or prior development, or where agricultural lands have been abandoned. Disturbed habitat is generally dominated by non-native weedy species that adapt to frequent disturbance or consists of dirt trails and roads, as is the case on site. Disturbed habitat on site totals approximately 6.3 acres. An additional 1.1 acres of disturbed habitat occurs within the off-site impact area.

4.2 RIPARIAN/RIVERINE AND VERNAL POOL ASSESSMENT (MSHCP SECTION 6.2.1)

The unnamed drainages on site periodically convey surface water but with the exception of two small areas of disturbed wetland, do not support wetland vegetation. There are two main ephemeral drainages that traverse the site from east to west and from northeast to southwest, in addition to a few other shorter, scattered drainages, totaling 1.24 acres (Figure 7). Widths of on-site drainages range from less than 1 foot to 15 feet. All on-site drainages are considered Riverine but not Riparian. The disturbed wetland on site totals 0.09 acre and is considered Riparian. The mule fat scrub that occurs on site is isolated from the drainages and is not considered Riparian/Riverine. No vernal pool habitat is present on site.

The definition of Riparian/Riverine habitats is based on potential for the habitat to support Riparian/Riverine Covered Species, which are identified in MSHCP Section 6.1.2 and described below.

4.2.1 Plants

Twenty-four plant species are identified in the MSHCP as potentially occurring in Riparian/Riverine and vernal pool habitats. Shrub and tree species such as California black walnut (*Juglans californica* var. *californica*), Engelmann oak (*Quercus engelmannii*), Coulter's matilija poppy (*Romneya coulteri*), and San Miguel savory (*Satureja chandleri*) would have been readily identifiable during project surveys but were not found on site. Several species, including spreading navarretia (*Navarretia fossalis*), California Orcutt grass (*Orcuttia californica*), prostrate navarretia (*Navarrettia prostrate*), San Diego button-celery (*Eryngium aristulatum* var. *parishii*), thread-leaved brodiaea (*Brodiaea filifolia*), fish's milkwort (*Polygala cornuta* var. *fishiae*), lemon lily (*Lilium parryi*), ocellated Humboldt lily (*L. humboldtii* ssp. *ocellatum*), Mojave tarplant (*Deinandra mohavensis*), Parish's meadowfoam (*Limnathes gracilis* var. *parishii*), and slender-horned spineflower (*Dodecahema leptoceras*), have distributions well outside of the study area. The remaining species have a distribution that includes the project area or occur in habitats found on site and are discussed in greater detail below. None of the 24 MSHCP Riparian/Riverine species, including those discussed below, was observed on the property.

The Santa Ana River woolly-star (*Eriastrum densifolium* spp. *sanctorum*) is found along the Santa Ana River in two locations and is restricted to open washes and early-successional alluvial fan scrub on open slopes above main watercourses, such as the Santa Ana River on fluvial deposits where flooding and scouring occur at a frequency that allows the persistence of open shrublands. No appropriate habitat occurs on site for the Santa Ana River woolly-star.

Suitable habitat for Brand's phacelia (*Phacelia stellaris*) includes coastal dunes and/or coastal scrub in sandy openings, sandy benches, dunes, sandy washes, or flood plains of rivers at elevations between 0 and 1,200 feet. Brand's phacelia is known from two locations on sandy terraces along the Santa Ana River (at Fairmont Park and along a horse trail in the Santa Ana Wilderness Area along the Santa Ana River). Given the highly disturbed nature of the site, this species is not expected to occur.

Riparian/Riverine Areas

SAN GORGONIO CROSSINGS

HELIX Environmental Planning

0 350 Feet

Figure 7

CVAR_09525

Graceful tarplant (*Holocarpha virgata* ssp. *elongata*) occurs in chaparral, cismontane woodland, coastal sage scrub, and valley and foothill grasslands below 1,900 feet (CNPS 2009). This species would not be expected to occur on site.

Mud nama (Nama stenocarpum) is restricted to muddy embankments of marshes and swamps and within lake margins and riverbanks (CNPS 2009). Three populations are known from Riverside County, with 2 occurring along the San Jacinto River (Dudek 2003). No appropriate habitat occurs on site.

Orcutt's brodiaea (*Brodiaea orcuttii*) occurs in clay soils in mesic native and non-native grasslands that often include vernal pools as well as moist meadows and along stream courses at higher elevations (Reiser 2001; CNPS 2009). The core population in Riverside County is the Santa Rosa Plateau (Dudek 2003). No clay soils are present on site.

San Jacinto Valley crownscale (*Atriplex coronata* var. *notatior*) is restricted to grassland, playas, and vernal pools with alkali soils (Dudek 2003). This species typically occurs on the margins of areas subject to short-term inundation and does not develop in areas that support regular long-term ponding or flooding. No alkali soils or appropriate habitat occur on site.

Smooth tarplant (*Centromadia pungens*) is found in southwestern California and northwestern Baja California, Mexico (Baja) and occurs in San Bernardino, Riverside, and San Diego counties. This species occurs in a variety of habitats, including alkali scrub and playas, riparian woodland, watercourses, and grasslands with alkaline affinities (Dudek 2003; CNPS 2009). No alkali soils are present on site.

Vernal barley (*Hordeum intercedens*) occurs in grassland, vernal pools, and vernal playas and is restricted to clay and alkaline, silty-clay soils in Riverside County (Dudek 2003). Twelve populations are known from Riverside County along the San Jacinto River and Salt Creek. No appropriate soils occur on site.

4.2.2 Animals

Invertebrates

Vernal pool fairy shrimp (*Branchinecta lynchi*) occurs throughout the Central Valley and in several disjunct populations in Riverside County. This species exists in vernal pools and other ephemeral basins often located in patches of grassland and agriculture interspersed in Diegan coastal sage scrub and chaparral. Riverside fairy shrimp (*Streptocephalus woottoni*) occurs in Riverside, Orange, and San Diego counties as well as in northern Baja. This species is typically found in deeper vernal pools and other ephemeral basins that hold water for long periods of time (30 or more days). Santa Rosa Plateau fairy shrimp (Linderiella santarosae) are limited to the Santa Rosa Plateau. No vernal pools or ephemeral basins occur on site and none of the four sensitive fairy shrimp species is expected to occur.

Fish

The Santa Ana sucker (*Catastomus santaanae*) is restricted to the Santa Ana River watershed with year-round flows. No appropriate habitat occurs on site.

Amphibians

No appropriate habitat for the 3 amphibian species (arroyo toad [*Bufo californicus*], mountain yellow-legged frog [*Rana muscosa*], or California red-legged frog [*Rana aurora draytonii*]) listed under MSHCP 6.1.2 occurs on site, and none of these species has any potential to occur on site.

Birds

The least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) are found in southern willow scrub, cottonwood forest, mule fat scrub, sycamore alluvial woodland, and arroyo willow riparian forest habitats that typically feature dense cover. No suitable habitat for the least Bell's vireo, southwestern willow flycatcher, and western yellow-billed cuckoo occurs on site.

Both the bald eagle (*Haliaeetus leucocephalus*) and peregrine falcon (*Falco peregrinus*) occur primarily in and adjacent to open water habitats, with the falcon possibly occurring in riparian areas. No suitable habitat occurs on site.

The ephemeral drainage and mule fat scrub on the proposed project site are not suitable to support any of the above-mentioned MSHCP covered species.

4.3 NEPSSA SENSITIVE PLANT SPECIES

The site occurs in an area identified by the MSHCP as requiring focused surveys for NEPSSA Area 8 plant species Yucaipa onion and many-stemmed dudleya. Focused surveys were conducted for these 2 species, which were not detected; therefore, it is concluded that they are not present on the site.

4.4 SENSITIVE ANIMAL SPECIES

The only focused survey required for sensitive animal species on the site is for the burrowing owl. Both winter (January 2005) and breeding (June 2005; April-May 2007; August 2008) season burrowing owl surveys were conducted on the project site by HELIX with negative results. The habitat assessment determined that the mule fat scrub habitat present is not developed enough to support riparian bird species such as the least Bell's vireo or southwestern willow flycatcher. No additional focused animal surveys are required.

5.0 MSHCP CONSISTENCY/ BIOLOGICAL ISSUES AND CONSIDERATIONS

As noted above, this project is within the Pass Area Plan but lies entirely outside of any Criteria Cells (Figure 5). The site is required to show MSHCP compliance through specific habitat assessments, applicable biological surveys, and provision of an MSHCP compliance analysis. Because the site lies outside of Criteria Cells, it is not required to be reviewed through the Habitat Acquisition and Negotiation Strategy process or the RCA's JPR to demonstrate MSHCP compliance.

5.1 RIPARIAN/RIVERINE AND VERNAL POOLS MSHCP SECTION 6.1.2

Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools, states:

> The purpose of the procedures described in this section is to ensure that the biological functions and values of these areas throughout the MSHCP Plan Area are maintained such that Habitat values for species inside the MSHCP Conservation Area are maintained.

Section 6.1.2 of the MSHCP focuses on protection of Riparian/Riverine areas and vernal pool habitats capable of supporting MSHCP covered species, particularly within the identified Conservation Area. The project site encompasses 1.25 acres of unvegetated, ephemeral drainage courses that are considered Riverine under Section 6.1.2. An additional 0.04 acre of disturbed wetland occurs on site and is considered Riparian under Section 6.1.2 (Figure 7). An additional 0.12 acre of ephemeral drainage occurs in the offsite study area. The functions of the unvegetated Riverine streams and disturbed wetland on the property are primarily water conveyance, sediment transport, and energy dissipation (hydrologic regime and flood attenuation).

Within the site, in addition to the 0.04 acre of disturbed wetland noted above, Riparian vegetation (mule fat scrub) is limited to a very small area (approximately 0.06 acre) in an area outside of any drainage courses; thus, this vegetation is not considered Riparian under the MSHCP. As noted, species associated with Riparian/Riverine habitats (least Bell's vireo, southwestern willow flycatcher, western yellow-billed cuckoo, and others) do not occur on site because no suitable habitat occurs. No vernal pools exist on the site; therefore, no vernal pool species are expected to occur. None of the species covered under Section 6.1.2 has any potential to occur on the project site; however, the drainages on the site are considered Riparian/Riverine as they are tributary to downstream resources with potential to support sensitive Riparian species. Because the proposed project would result in impacts to Riverine and limited Riparian resources, a DBESP must be prepared to be consistent with Section 6.1.2.

A DBESP was prepared for the project (HELIX 2012). The goal of the DBESP process is to determine if the project has in fact provided for a project alternative that results in biologically equivalent or superior preservation. The first priority for sensitive habitats under the California Environmental Quality Act (CEQA) and under the MSHCP is avoidance of direct impacts. The

proposed land use requires large pads that cannot be effectively reshaped to avoid Riparian/Riverine resources. Complete avoidance of the Riparian/Riverine resources would eliminate the viability of the development on the site because of the distribution of the drainages across the site. Total avoidance can be achieved only by minimal or no project alternatives, which render the project infeasible.

The proposed project would impact approximately 1.07 acres of streambed habitat considered Riverine and 0.04 acre of disturbed wetland that is considered Riparian (Figure 8). The current project does avoid impacts to the Riverine resources in the northwestern portion of the site. Impacts to 0.30 acre (23 percent; Figure 8) of the Riverine resources have been avoided to the maximum extent practicable.

Section 6.2.1 of the MSHCP states:

> If an avoidance alternative is not Feasible, a practicable alternative that minimizes direct and indirect effects to Riparian/Riverine areas and vernal pools and associated functions and values to the greatest extent possible shall be selected.

Mitigation measures that would result in equivalent or superior preservation of the functions and values of Riverine resources impacted by the project are shown here. Minimization measures for the proposed project will include the use of standard Best Management Practices (BMPs) to minimize the impacts during construction. Equipment will be stored in upland areas, outside of drainages, except as required by project design (restoration, trash removal, etc.). Removal of trash located throughout the property will decrease the potential of pollutants entering the Riparian/Riverine areas downstream. The removal of the pollutants will increase the functions and values of the Riparian/Riverine areas proposed to be restored, thus replacing a portion of functions and values that will be lost within the project footprint.

Source control and treatment control BMPs will be implemented to minimize the potential contaminants that generated during and post construction. Source control BMPs include landscape planning, roof runoff controls, trash storage areas, use of alternative building materials, and education of future tenants. Treatment control BMPs include detention basins, vegetated swales (bio-swales), drain inlets, and vegetated buffers. The water quality BMPs will be implemented throughout the project to capture and treat contaminants.

Mitigation for impacts to 1.11 acres of Riverine and limited Riparian resources will occur through on-site creation at a 2:1. In total, the proposed mitigation will result in 2.22 acres of Riparian and Riverine habitat creation/restoration.

The on-site creation of 2.22 acres of Riparian and Riverine habitat will occur at two locations on site along the southern boundary (Figure 9). The mitigation areas will receive all upstream flows up to 100 cubic feet per second (CFS). Flows above 100 CFS will bypass the mitigation area in a concrete-lined channel that will outlet at the eastern edge of the project. Flows up to 100 CFS will allow for creation of a braided streambed similar to the drainages that are being impacted. These areas will be primarily revegetated with floodplain scrub vegetation. Scattered pockets of mule fat scrub will also be planted to increase vegetative diversity. Combined, these areas will

offset losses of Riverine functions and values by providing high quality Riparian/Riverine habitat, as well as other functions and services such as water quality benefits, groundwater recharge, and nutrient cycling. A detailed restoration plan for the on-site mitigation sites will be prepared and submitted to the County for review and approval prior to implementation of the restoration effort.

5.2 NARROW ENDEMIC PLANT SPECIES MSHCP SECTION 6.1.3

The proposed project site is within an area designated as a NEPSSA area for two plant species: many-stemmed dudleya and Yucaipa onion. Sensitive plant surveys were conducted and were negative; therefore, the project is consistent with MSHCP Section 6.1.3.

5.2.1 Many-stemmed Dudleya

Many-stemmed dudleya is restricted to clay and cobbly clay soils associated with Altamont, Auld, Bosanko, Claypit, and Porterville series soils. This species occurs in scattered locations primarily in the Temescal Canyon, Gavilan Plateau, and Alberhill areas and the Santa Ana Mountains. None of these soils occurs on the site, and focused surveys for this species were negative.

5.2.2 Yucaipa Onion

This species has been previously associated within clay openings in chaparral habitat. It is known from only two occurrences in the Yucaipa and Beaumont areas of the southern San Bernardino Mountains. Plant locations were recorded in 1921 in the general area of Beaumont, and no positive identifications have been made since that time. Focused surveys for this species were negative.

In compliance with Section 6.1.3, this project would not affect any NEPSSA species, since none is present on site.

5.3 URBAN WILDLAND INTERFACE GUIDELINES MSHCP SECTION 6.1.4

Section 6.1.4 addresses potential indirect impacts to MSHCP preserve lands via the Urban Wildland Interface Guidelines (UWIG). Because the project does not occur within or adjacent to any proposed Conservation Areas within the MSHCP, there are no requirements for consistency with Section 6.1.4.

5.4 ADDITIONAL SURVEYS MSHCP SECTION 6.3.2

The project is not within any Criteria Area Species Survey Area (CASSA), amphibian survey area, or a mammal survey area. The project does occur within the burrowing owl survey area. Both winter and breeding season burrowing owl surveys were conducted, and no burrowing owls or burrows were present on the site (HELIX 2005, 2007, and 2008). No other surveys are required, and the project is consistent with MSHCP Section 6.3.2.

5.5 FUELS MANAGEMENT MSHCP SECTION 6.4

The proposed project site is not in or adjacent to any MSHCP Conservation Area and therefore fuel management associated with the project will not encroach upon the Conservation Area.

5.6 MSHCP FEES

The project applicant shall pay MSHCP Local Development Mitigation fees as determined by the County. The fee schedule is adjusted annually by the RCA, and was last adjusted on July 1, 2008. The current fee is $6,597 per acre for commercial or industrial uses (RCA 2008). When mixed uses are proposed within the same project, the commercial fee is applied to the whole project based on the underlying classification of the property at the time of issuance of a building permit. However, fees may be offset through on- or off-site conservation.

6.0 CONCLUSION

Development of the subject property would be consistent with the MSHCP based on the following:

- While found within the Pass Area Plan of the MSHCP, the project site is not within any Criteria Cell or other Conservation Area.

- The project site does not support any species associated with Riparian/Riverine habitat, and the proposed mitigation offsets functions and values lost by on-site development; therefore, the project is consistent with Section 6.1.2.

- The project is within NEPSSA Area 8, for Yucaipa onion and many-stemmed dudleya. Sensitive plant surveys were conducted and were negative; therefore, the project is consistent with Section 6.1.3.

- The project site is not adjacent to an existing or planned conservation area; therefore, there are no requirements for consistency with Sections 6.1.4 and 6.4.

- The project is not within any CASSA area for plants, amphibians, or mammals. The project occurs within the burrowing owl survey area. No burrowing owls or active burrow locations were observed on the property during the focused surveys. Therefore, the project is consistent with MSHCP Section 6.3.2.

- The project is subject to the MSHCP fee that is currently set at $6,597 per commercial or industrial acre.

7.0 CERTIFICATION/QUALIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this biological evaluation, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

Burrowing Owl

Burrowing owl.

Narrow Endemic Plant Species

8) Marvin's Onion, Many-stemmed dudleya

If potential habitat for these species is determined to be located on the property, focused surveys may be required during the appropriate season.

Background

The final MSHCP was approved by the County Board of Supervisors on June 17, 2003. The federal and state permits were issued on June 22, 2004 and implementation of the MSHCP began on June 23, 2004.

For more information concerning the MSHCP, contact your local city or the County of Riverside for the unincorporated areas. Additionally, the Western Riverside County Regional Conservation Authority (RCA), which oversees all the cities and County implementation of the MSHCP, can be reached at:

Western Riverside County Regional Conservation Authority
3403 10th Street, Suite 320
Riverside, CA 92501

Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less than Significant Impact	No Impact

(Check the level of impact the applies to the following questions)

a) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state conservation plan?
☐ ☐ ☐ ☒

b) Have a substantial adverse effect, either directly or through habitat modifications, on any endangered, or threatened species, as listed in Title 14 of the California Code of Regulations (Sections 670.2 or 670.5) or in Title 50, Code of Federal Regulations (Sections 17.11 or 17.12)?
☐ ☐ ☐ ☒

c) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U. S. Wildlife Service?
☐ ☐ ☒ ☐

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident migratory wildlife corridors, or impede the use of native wildlife nursery sites?
☐ ☐ ☐ ☒

e) Have a substantial or adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U. S. Fish and Wildlife Service?
☐ ☒ ☐ ☐

f) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filing, hydrological interruption, or other means?
☐ ☒ ☐ ☐

g) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
☐ ☐ ☐ ☒

Source: CGP Fig. VI.36-VI.40

Findings of Fact: b. There is potential habitat on site for coastal California gnatcatcher. Potential impacts to this species is covered under the MSHCP.

c. Three state sensitive species were observed on site, orange-throated whiptail, Bell's sage sparrow, and northern harrier, several other sensitive plant and animal species have potential to occur on site. Impact to these species are covered under the MSHCP.
d. The project will result in impact to habitat classified as Riparian/Riverine under the MSHCP.
e. Permits will be obtained from the regulatory agencies prior to impacts to jurisdictional waters.

Proposed Mitigation: b and c. Compliance with the MSHCP covers these impacts.

d. A Determination of Biologically Equivalent or Superior Preservation will be prepared and will document the mitigation for the Riparian/Riverine impacts.
e. Mitigation for the impacts to the jurisdictional waters will be determined during the permitting process. The project will comply with the mitigation set forth during the permitting process.

Monitoring Recommended:

Subject: Results of Burrowing Owl (*Athene cunicularia*) Survey for the Interstate 10 Gateway Job Center

Dear Mr. Rupp:

At your request, HELIX Environmental Planning, Inc. (HELIX) conducted a focused burrowing owl survey for the Interstate (I-) 10 Gateway Job Center project site. This letter documents the results of the survey, which meets applicable conditions under the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) approved in 2003. The MSHCP is a comprehensive planning effort that includes the County of Riverside (County) and 15 cities. As part of the MSHCP implementation, enrolled jurisdictions are required to impose terms of the MSHCP, including appropriate surveys in accordance with Section 6, Volume I. The site is within the survey area for burrowing owl; therefore, surveys are required if potential habitat is present (Dudek and Associates 2003). This report presents the details and results of the 2008 survey and includes survey results for the burrowing owl conducted in 2005 and 2007.

PROPERTY LOCATION AND DESCRIPTION

The approximately 230-acre property is located east of I-10 and north of Cherry Valley Boulevard in the unincorporated community of Cherry Valley, Riverside County, California (Figure 1). The site is situated in Section 30, Township 2 South, Range 1 West as shown on the U.S. Geological Survey 7.5-minute El Casco quadrangle (Figure 2).

Elevation on site ranges from 2,400 to 2,690 feet above mean sea level. The property is bordered by a chicken ranch to southeast. There is a small horse ranch and I-10 is to the southwest. To the northwest, there is some agricultural land and a residential community. The remainder of the property is bordered by undeveloped land, with the exception of a few rural residential homes to the north. An aerial photo of the property is provided as Figure 3.

PROJECT DESCRIPTION

The proposed project is for the construction of 2 large industrial buildings on approximately 190 acres of the property. The project includes detention basins, parking, landscaping, and other associated infrastructure.

METHODS

The survey was conducted according to the burrowing owl survey guidelines for the MSHCP (County 2006). The survey area included all habitats with potential to support burrowing owls within the project area. Transects approximately 20 to 30 meters apart were surveyed on the entire project site. Steep slopes were visually surveyed with the aid of binoculars. A 500-foot buffer zone was surveyed visually from the subject property, where owl habitat bordered the site. Biologists walked slowly and methodically, closely checking the areas that met the basic requirements of owl habitat, listed below.

- Open expanses of sparsely vegetated areas (less than 30 percent canopy cover for trees and shrubs)
- Gently rolling or level terrain
- An abundance of small mammal burrows, especially those of California ground squirrel (*Spermophilus beecheyi*)
- Fence posts, rock, or other low perching locations

Survey dates, times, and conditions are listed in Table 1.

Table 1
SURVEY INFORMATION

Date	Time (hrs)	Weather Conditions	Personnel
8/27/08	0600-0830	Clear, 62° - 79° F, wind 0-2 mph	Rob Hogenauer Zsolt Kahancza
8/28/08	0625-0830	Partly cloudy, 68° - 77° F, wind 1-3 mph	Rob Hogenauer Zsolt Kahancza
8/29/08	0615-0815	Partly cloudy 68°F - 79° F, wind 0-2 mph	Rob Hogenauer Zsolt Kahancza
8/30/08	0610-0750	Overcast, 67°F - 73° F, wind 4-8 mph	Rob Hogenauer Brian Parker

The first survey of the property covered the entire project area, where biologists searched for burrows with potential to support burrowing owls. Figure 4 identifies the approximate transects surveyed on the property. The topography of the

property caused some variation in the actual transects surveyed. Areas that did not contain burrows with potential to support burrowing owls were not surveyed on subsequent surveys. These excluded areas are comprised of dense vegetation (Figure 5a) or disturbed areas (Figure 5b) lacking burrows with potential to support burrowing owls. Potential owl burrow locations on site include brush piles, fossorial mammal burrows, and rock piles. All potential owl burrows were checked for signs of recent owl occupation, which include:

- Pellets/Casting – regurgitated fur, bones, and insect parts
- White wash – excrement
- Feathers

RESULTS

Vegetation Habitats

Six vegetation habitats along with a small amount of developed habitat occur on the property. The habitats are mule fat scrub, Riversidean sage scrub, coastal sage-chaparral ecotone, scrub oak chaparral, non-native grassland, and disturbed habitat. The survey area was comprised mainly of non-native grassland, Riversidean sage scrub, and disturbed habitats.

Burrowing Owls

No burrowing owls were observed during any of the site visits. Burrows that could support burrowing owls were observed on site but did not show any signs of owl activity. The burrows were primarily located in the southern and western portions of the property. The northern and eastern areas of the property contain relatively few burrows with potential to support burrowing owls. The majority of the grassland on site was comprised of dense stands of mustard (*Hirschfeldia incana*, *Brassica* spp.), Russian thistle (*Salsola tragus*), bromes (*Bromus* spp.), and various weeds, herbs, and forbs.

There are approximately 120 acres of habitat in the project area with low potential to support burrowing owls. The remainder of the property lacks burrows that could support burrowing owls, or is covered with dense vegetation. Surveys conducted in 2005, 2007, and 2008 all had negative results. No burrowing owls or sign of burrowing owl is present on site.

The MSHCP states that pre-construction surveys for burrowing owls should be conducted for all properties that contain suitable burrowing owl habitat. A pre-construction survey is to take place within 30 days prior to disturbance of the property in question.

Attachment A contains a list of animal species observed or detected during the 3 years of burrowing owl surveys and other surveys conducted on the property.

Please call Barry Jones at (619) 462-1515 or me at (951) 328-1700 if you have any questions about this report.

Sincerely,

Rob Hogenauer
Wildlife Biologist

MANAGEMENT SUMMARY

This report documents a Phase 1 archaeological survey for an approximately 237-acre project site known as the I-10 Gateway Center located near the Town of Cherry Valley, in unincorporated Riverside County, California. All lands within the area proposed for development are private and are under the local jurisdiction of the County of Riverside. The westernmost parcel of 8.79 acres is located in the City of Calimesa but the County will act as the Lead Agency.

Qualified cultural resource staff from Michael Brandman Associates (MBA) have performed this investigation for the proponent The Shopoff Group, Inc., but under the County Memorandum of Understanding (MOU), MBA must write the report acting as the County's agent. The purpose of the study was to determine if cultural resources more than 45 years old were located within the project site, and then develop a strategy to mitigate for impacts to any potentially significant cultural resources that are or could be located on the project site.

The Proponent will be constructing a logistics center consisting of two large warehouse type buildings, hardscaping, landscaping, roadways, parking lots and roadway access points to Cherry Valley Boulevard. Approximately 68 acres are proposed to remain as Open Space.

Assessor's Parcel Numbers (APNs) 407-220-004, 407-220-007, 407-220-008, 407-220-009, 407-220-014, 407-220-016, 407-220-017, 413-270-012, and 413-270-013 constitute the entirety of the project area. These properties are currently vacant. Our research shows that the flatter parts of these parcels were plowed in the 1920s or 1930s for the purposes of dryland farming. Some native vegetation is located on the finger ridges and the steeper hillsides. There are no intact structures on the property.

A cultural resource literature search for the project was conducted on September 12, 2012 by the Author at the Eastern Information Center (EIC), which is located at the University of California, Riverside. A search radius of one mile was used during this effort. The results of the literature search indicated that few cultural resources are known within the search radius, and although the project site was surveyed in 1990, it does not currently contain recorded cultural resources. A lower density of prehistoric resources is expected for this part of the County compared to other areas because the Beaumont Plain is relatively dry.

MBA contacted the Native American Heritage Commission (NAHC) on September 7, 2012 requesting a Sacred Lands File search for traditional cultural properties. The NAHC response, provided to MBA staff on September 10, indicated that no sacred lands or traditional cultural properties are known for the project area. To ensure that Native American concerns are addressed at this stage of the proposed project, letters to each of the eight listed tribal contacts were mailed September 12. To date, one response (from Michael Contreras of the Morongo Band of Mission

Indians) has been received, and Mr. Contreras did not indicate that there were sacred lands issues with this project.

MBA staff archaeologists conducted a survey of the project site on September 13, 14 and 27, 2012. No cultural resources were encountered, a result similar to that of a survey of the property that took place in 1990.

Our experience with plowed fields elsewhere in Riverside County suggests that buried prehistoric sites, historic-era middens, and historic archaeological sites to tend to become exposed to view even through the plow-zone horizon of an abandoned farm. After examining the details of our study carefully, we believe that plowing so damaged the original landscape of the flats that no intact soils exist in the farmed areas to a point about 3 feet below current grade. The finger ridges between the flats were not plowed and many of these exhibit native vegetation, yet none show any sign of cultural resources. Based on the evidence at hand, the potential for impacts to unknown cultural resources during construction of the project is considered "low." For this reason, mitigation monitoring of the project site during construction is not recommended.

SECTION 1: INTRODUCTION

Qualified archaeological staff from Michael Brandman Associates (MBA) has conducted a Phase 1 cultural resource assessment of a set of nine parcels totaling 242.63 acres located west of the community of Cherry Valley, in unincorporated Riverside County, California. MBA has performed this investigation for the Proponent (TSG Cherry Valley, L.P.). The Proponent is entitling these parcels to construct a logistics center. Two of the parcels are located within the jurisdiction of the City of Calimesa but the whole of the project will be processed by the County of Riverside as the Lead Agency following CEQA Guidelines.

Federal, state, and local Agencies have developed laws and regulations designed to protect significant cultural resources that may be affected by projects regulated, funded, or undertaken by the Agency. These laws govern the preservation of historic and archaeological resources of national, state, regional, and local significance. This cultural resource study was also performed in compliance with the California Environmental Quality Act (CEQA) and the County of Riverside Phase 1 Archaeological Survey MOU parameters. Mr. Dice is pre-qualified to perform archaeological surveys on jurisdictional lands within the County of Riverside and is County Archaeologist #101.

This report closely follows the California Office of Historic Preservation (OHP) procedures for cultural resource surveys and the OHP's Archaeological Resource Management Report (ARMR) reporting format for archaeological reports. This report is organized into sections and appendices, which are summarized as follows:

- Section 1 introduces the project, the location, and the cultural resources team.
- Section 2 summarizes cultural setting.
- Section 3 presents the research design and investigative methods.
- Section 4 provides cultural resource survey and records search results.
- Section 5 provides management recommendations.
- Section 6 contains the project certification.
- Section 7 provides the required County of Riverside F-6 Checklist
- Section 8 presents the references cites during this study.
- Appendix A provides personnel qualifications.
- Appendix B presents the regulatory framework.
- Appendix C provides recent photographs of the project area.

1.1 - Project Location

Situated in the northwest portion of the County of Riverside, the project area is located north of Interstate 10 (I-10), west of Beaumont and east of the City of Calimesa (Exhibit 1). The boundaries of the project area can be found on the El Casco, CA. USGS 7.5-minute Topographic Quadrangle

Map. The project is located in Section 30 of Township 2 South - Range 1 West (Exhibit 2). The project area includes nine parcels totaling 242.63 acres, which according to the County of Riverside Assessors website contains the following individual acreages: Assessor's Parcel Number (APN) 407-220-004 (12.82 acres), 407-220-007 (26.73 acres), 407-220-008 (6.24 acres), 407-220-009 (97.89 acres), 407-220-014 (0.12 acres), 407-220-016 (64.41 acres), 408-220-017 (20.05 acres) and in the City of Calimesa APN 413-270-012 (5.58 acres) and APN 413-220-013 (8.79 acres). A modern aerial image of the project site has been provided herein (Exhibit 3).

1.2 - Project Description and Report Purpose

Totaling approximately 230 gross acres, roughly 144 acres are proposed to be developed and the remaining 86 acres is proposed to remain as natural open space. The project consists of two industrial buildings that are proposed to be designed as eligible for Leadership in Energy and Environmental Design (LEED) Certification and will total approximately 2,560,000 square feet (sq ft). Additional development on the project site includes up to 428 dock doors, private streets, natural washes, detention basins/bio swales, landscaping, and a 200-foot drainage setback is planned along Cherry Valley Boulevard. Three access points will be provided off Cherry Valley Boulevard (Exhibit 4).

The structural facilities are planned to house a variety of industrial uses, including some that would be considered "high cube" type wholesale distribution users. Both industrial buildings will total approximately 39 feet in height. Building 2 will contain four offices located at each corner of the proposed building. Building 1 will contain an office on the southwest and southeast corner of the proposed building.

Equipment and commodities to be stored on the property include vehicles, trucks, trailers, and equipment associated with the industrial buildings; products and goods that will be distributed to retailers, wholesalers, or sold directly to consumers; maintenance equipment and machinery; office supplies and equipment; and fuels for vehicles. Vehicle and equipment maintenance to be performed on the property includes routine vehicle maintenance, and maintenance and repair of equipment and machinery for operations.

Based on the proposed development plan, the project will not have a formal phasing plan but will develop according to market conditions and infrastructure system connections. The backbone infrastructure will be phased to provide incremental capacities capable of serving the level of development proposed during project buildout.

Attendant utility systems will be graded and installed by phase except for key backbone connections as needed for system operation and integrity. Grading will include over-excavation for utilities. All grading and earthwork activities would be performed in accordance with the general earthwork and grading specifications of the County of Riverside. A review of the proposed site plan and site cross-sections relative to existing grades indicates that development will require manufactured slopes ranging from twenty feet (upslope from Cherry Valley Boulevard) west of the primary access to sixty feet (downslope from Cherry Valley Boulevard)) west of the emergency access point to create usable pads. Finally, grass swales, debris basins, and subsurface sewer/storm water pipelines will be constructed.

1.3 - Environmental Setting

1.3.1 - Topography, Geology, and Soils of the Beaumont Plain

The project area is located within a geological formation known as the Beaumont Plain Fault Zone (Matti et al 1992), and is located about 2 miles west of the low saddle that separates the San Gorgonio Creek water shed and flows into the Coachella Valley from the San Timoteo Creek watershed and flows into the Santa Ana River. The property is located in incised alluvium with surface flows heading toward the southwest and into the headwaters of San Timoteo Canyon. The project site lies between the northwestern portion of the San Jacinto Mountains and the San Timoteo Badlands, and lies along the southern foothills of the San Bernardino Mountains. The Plain is part of a large graben, which has dropped between the two mountain ranges during the last 10 million years and then filled with alluvial sediment.

During the Pliocene (5.33 to 2.58 million years ago [MYA]) and Pleistocene Epochs (2.58 MYA to 12,000 years before present [YBP]), the Los Angeles Basin sank many thousands of feet, while the San Jacinto Mountains rose considerably through compressional forces, and the Perris Block oscillated vertically (Woodford et al 1971). The vertical tectonics are indicated by right-lateral strike-slip faulting on the San Jacinto fault system, creating a broad anticline in the region known as the San Timoteo Anticline (Manson et al 2002) with the graben in the Beaumont Plain dropping as a result of compressional and strike-slip forces. The Banning fault is the primary fault in the San Gorgonio Pass area and the idea that the faults lying between the two mountain ranges were once part of an ancestral San Andreas fault system (aka the Vincent Thrust) has been proposed (Geological Survey Bulletin 845; http://www.data.scec.org/significant/banning.html). This combination of factors led to the deposition of hundreds of feet of alluvium in this region as the graben sunk. This is why no bedrock in the project site was observed during the archaeological survey.

According to Scott (2012), previous geological mapping (also see Rogers 1965, Morton 2004) indicates that the project area encompasses surface exposures of older Pleistocene overlain in arroyos and gullies by a thin veneer of Holocene sediments consisting of alluvium ("Qya5" and Qyf5"). The US Department of Agriculture (USDA) soils website (Knecht 1971) shows the finger ridges termed "terrace escarpments" and as such are unclassified, while the flats are entirely Hanford coarse sandy loam (HcC). These are soils consisting of well-drained alluvial fans derived from granitic material.

1.3.2 - Vegetation and Wildlife

The entire project area was biologically surveyed by HELIX (2012). Eight vegetation communities were detected by HELIX biologists, the majority of which was non-native grassland (173.1 acres). In order of decreasing size, the project area contains Riversidean-Diegan coastal sage scrub, scrub oak chaparral, Riversidean sage scrub, disturbed habitat and minor amounts of isolated eucalyptus and mulefat habitat. MBA staff observed lizard and small mammal species during the survey. Except for one or two burrows that could have been used by coyotes, no evidence of large mammals on the site was observed.

1.3.3 - Historical Land Use

MBA staff reviewed a series of historic aerial photographs from 1938, 1959, and 1967, both on-line and from aerial photograph collections MBA has developed for previous nearby projects. The earliest photographs suggested that the flattest parts of the project area had been cleared of native vegetation by plowing. The land was not being irrigated at the time and the plowing was probably undertaken to foster the growth of grass for grazing. During this period it may have been possible to grow a dryland hay crop in the spring because of cooler temperatures and higher soil moisture content. The surface aquifer may not yet have been over-pumped at the time (the main groundwater aquifer is now located 500 feet below the surface today, according to the Beaumont-Cherry Valley Water District [http://www.bcvwd.org/recharge.asp]). The small Kehl Canyon watershed may have featured a small dam in Section 20 to the northeast of the project area where an old Kehl Ranch now lies, and this retention basin would have ended all water flows down the main body of the dry channel that crosses the site from east to west.

By 1959, plowing had been extended even further into the small canyons north of the project area leaving finger ridges between each flat spot with dense native vegetation upon them (Exhibit 5). The images show a small gully being formed because of runoff from Cherry Valley Boulevard (aka Woodland Avenue): this has subsequently enlarged and deepened to about 15 feet below the plain. In 1967 the native vegetation on the property seems to have declined (there was no sign of fire on these ridges) and the decline has accelerated to the point where today most of the original native vegetation on the low finger ridges in the project area is nearly gone.

1.4 - Assessment Team

Mr. Dice conducted the records search. MBA archaeologists Michael Dice, M.A., Arabesque Said, and Andrea Stella conducted a pedestrian survey of the project area on September 13 and 14, 2012. Follow-up work was done on the job site on September 27, 2012 by Mr. Dice. Professional qualifications of Michael Dice, M.A. (County of Riverside Archaeologist #101), can be found in Appendix B.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 2: CULTURAL SETTING

2.1 - Prehistoric Background

The most accepted regional chronology for coastal and the southern coast of southern California is from Wallace's four-part Horizon format (1955), which was later updated and revised by Warren (1968). Created to place temporal structure upon materialistic phases observed during archaeological syntheses, the advantages and weaknesses of southern California chronological sequences are reviewed by Warren (in Moratto 1984), Chartkoff and Chartkoff (1984), and Heizer (ed. 1978). Regional archaeologists generally follow Wallace's (1955) four-part southern California format when discussing the prehistory of Western Riverside County.

2.1.1 - Early Man Period

Spanning the period from approximately 15000 to 6000 B.C., archaeological assemblages attributed to this horizon are characterized by large projectile points and scrapers. The limited data available suggests that prehistoric populations focused on hunting and gathering, moving about the region in small nomadic groups. Technologies associated with ocean resource gathering would have likely been utilized in coastal areas.

2.1.2 - Millingstone Period

Characterized by the appearance of handstones and millingstones, this horizon tentatively dates to between 6000 and 1000 B.C. Assemblages in the early Millingstone Period reflect an emphasis on plant foods and foraging subsistence systems. For inland locales, it has been assumed that exploitation of grass seeds formed a primary subsistence activity. Artifact assemblages include choppers and scraper planes, but there is a general lack of projectile points in excavated assemblages. The appearance of large projectile points in the late portion of the Millingstone Horizon suggests the development of a more diverse economy. The distribution of millingstone sites reflects the theory that aboriginal groups may have followed a modified central-based wandering settlement pattern. In this semi-sedentary pattern, a base camp would have been occupied for a portion of the year, but small population groups seasonally occupied subsidiary camps in order to exploit resources not generally available near the base camp. Sedentism apparently increased in areas possessing an abundance of resources that were available for longer periods. More arid inland regions would have provided a seasonally and aerially dispersed resource base, restricting sedentary occupation.

2.1.3 - Intermediate Period

Dating between 1000 B.C. and 500 A.D., the Intermediate Horizon represents a transitional period. Little is known about the people of this period, especially those of inland southern California. Site assemblages retain many attributes of the Millingstone Horizon. Additionally, Intermediate Horizon sites contain large-stemmed or notched projectile points and portable mortars and pestles. The mortars and pestles suggest that the aboriginal populations may have harvested, processed, and

consumed acorns. Due to a general lack of data, neither the settlement and subsistence systems nor the cultural evolution of this period is well understood. It has been proposed that sedentism increased with the exploitation of storable food resources, such as acorns. The duration and intensity of occupation of base camps increased during this period, especially in the later part of the horizon.

2.1.4 - Late Prehistoric Period

Extending from 500 A.D. to Spanish Contact in 1769 A.D., the Late Prehistoric Horizon reflects an increased sophistication and diversity in technology. Assemblages characteristically contain projectile points, which imply the use of the bow and arrow and many late sites contain pottery. In addition, assemblages include steatite bowls, asphaltum, grave goods, and elaborate shell ornaments. Use of bedrock milling stations was widespread during this period. Increased hunting efficiency and widespread exploitation of acorns provided reliable and storable food resources. Cremation was the preferred method of burial and often times elaborate burial practices with extensive grave goods have been found at certain sites. The date of Uto-Aztecan migration into southern California is uncertain, but some authors have used linguistic extrapolations to suggest that earliest part of the Late Period saw an influx of Shoshonean speakers from the Great Basin (i.e., Kroeber 1925: AD 1-500).

2.2 - Native American Background

The following section discusses the Cahuilla group as the main tribal entity in the San Timoteo-San Jacinto region during the Pre-contact period, with the knowledge that Serrano groups may have also used the area during the Protohistoric period (Bean 1972, James 1969). On May 15, 1876, President Grant established the Morongo and eight other reservations in the area by Executive Order (at the time, these were called “agencies”). The name Morongo stems from the Serrano clan name Maarrenga'. The first official head of the San Gorgonio Agency recognized by the Bureau of Indian Affairs was the hereditary leader of the Maarrenga', known to Americans by his English name, John Morongo. Over time the BIA referred to the tribe as the Morongo Band of Mission Indians.

The Pass Cahuilla, a mountain unit of Cahuilla tribesman related to the Cahuilla of the San Jacintos and the Coachella Valley called the area Maalki. The Cahuillas are Takic-speaking peoples who once resided from the San Bernardino Mountains south into San Diego County. Many, but not all, of the Cahuilla peoples live on reservations: Cahuilla, Agua Caliente, Santa Rosa, Torres-Martinez, Cabezon, Morongo, Los Coyotes, Ramona, and Soboba. Today the Cahuillas number about twenty-four hundred people. Within their language-speaking group, the Cahuillas were divided into about a dozen independent clans containing five hundred to twelve hundred people each. These clans controlled separate territories of several hundred square miles each and maintained their own political authority. Each clan was allied through ritual systems that provided political stability and networks for economic exchange.

Community beliefs were clearly stated in various song cycles (epic poems) and historical accounts that described a clan’s sacred and secular history and provided guidelines for behavior. These beliefs

were reinforced on a regular basis, usually annually, in clan ritual centers where the texts of the song cycles were presented in their entirety-a process requiring several days to complete. The most important parts of these gatherings were the nukil ceremonies, which honored those members of a clan who had died since the last nukil ritual had been performed.

The pottery associated with the Cahuilla has been stylistically and ornamentally compared to that of an ancient Pueblo style, as well as to the Colorado River Indians, the Diegueno, Luiseño, and Mohave (Bean and Lawton 1975; Kroeber and Hooper 1978). It is constructed in coil form, and then shaped with a polishing stone and wooden paddle to be baked or fired in the sun. In many cases, their pottery was incised for decoration (Bean and Lawton 1975; Kroeber and Hooper 1978). Kroeber and Hooper (1978) suggest that the Cahuilla had four definitive pottery forms: an open bowl or dish, a cooking pot, a small-rimmed vessel and a wider opening rimmed vessel; and Bean and Lawton (1975) suggest that ladles, trays, and pipes were also manufactured. Baskets were an important item to the Cahuilla clan and were typically made in a variety of shapes and sizes, but always produced from a coil of mesquite branches, willow, or palm leaves. Grasses were used in the foundation and the only tool used to manufacture these baskets was a needle. These needles were either fashioned from the leg bone of a deer or made from a heavy cactus needle set into a wooden handle (Bean 1978).

Cahuilla homes were constructed with forked posts, which supported wood ceiling beams. These structures were then completely covered in thatch, which was slightly mixed with sand or soil. In some cases, the floor was subterranean and each house was positioned so that a level of privacy was attained (Bean 1978; Kroeber and Hooper 1978). Wilke (1978) notes that the Cahuilla homes were generally hidden in mesquite groves, which effectively obscured them from view. Ceremony and ritual was of great importance to the Cahuilla (Bean 1978). Deep ceremonial ties existed between the Serrano and the Cahuilla, and it is thought that the Desert Cahuilla may have adopted certain ceremonial practices from the Serrano (Strong 1972). Frequently practiced ceremonies included multiple rituals for the mourning of the dead, the eagle dance, summer and winter solstice celebrations and separate boys and girls' initiation rites (Strong 1972). This cultural linkage between the Cahuilla and Serrano is furthered by inferences from Mission baptismal records and Serrano oral tradition.

2.3 - Historic Background

Gunther (1984) notes that in mid-1885 the Cherry Valley Land and Water Company began selling acreage with the admonition that the land was good for raising cherries because, due to the altitude, the winter cold allowed for crops requiring a dormant season. As early as 1853, Powell Weaver (namesake of the Weaver Adobe) was growing fruit trees east of the project site at a slightly lower altitude. Reliable agricultural production required water and transportation, so once the Southern Pacific railroad snaked across the San Gorgonio Pass and into San Timoteo Canyon in the 1870s, small towns and farming land could be developed in the region.

A comprehensive historical review of the Banning-Beaumont area is noted in Chace and Laylander (1980). The following review details information taken from this and other secondary sources (i.e., SRS 1981; de Barros and Farnsworth 1990). In 1824, the San Gabriel Mission established a branch of the Mission at the highest point in the San Gorgonio Pass, along the foothills northwest of Banning. By that time, the area was known as Rancho San Gorgonio. According to the Banning website (Banning 2004), the first American settler to reach the area was a Dr. Isaac Smith in 1853. Smith purchased from a local Californio named Paulino Weaver an undivided one-third interest in Rancho San Gorgonio lands, who had originally obtained them from the Mexican Governor, Pio Pico. Smith brought his wife and seven children to the property to live and built a house known as Smith's Station, which later became Highland Home and subsequently Highland Springs. In 1854, Banning's first permanent landmark, the Gilman Ranch adobe, was constructed. The adobe was used as a stage stop by the Colorado Stage & Express Line, which was founded by Alexander & Co. of Los Angeles in the 1860s. The route ran through the foothills near Cherry Valley, a half-mile north of downtown Banning, then north of Cabazon and Whitewater, before reaching Palm Springs. The City is named in honor of General Phineas T. Banning, who in the mid-1850s freighted over the Mormon trail from Salt Lake to San Bernardino and Los Angeles and whom established the Port at San Pedro plus the first railroad to Los Angeles in 1871.

Homesteading did not occur west of the project site because lands in what is now part of the City of Calimesa were originally part of Santiago Johnson's little San Jacinto y San Gorgonio Tract (Lech 2004), which was sold to Louis Robidoux in April 1845. As noted previously odd-numbered sections were given to the railroads as an enticement to develop grades. Some of the odd-numbered sections inside the San Jacinto y San Gorgonio Tract were given to the Southern Pacific despite the former Rancho claims. The even numbered Sections of tract property made its way into the hands of homesteaders and survived mostly undivided and grazed upon by ranchers into the mid 20th Century. Water is scarce here in the form of natural springs and creeks because the property lies on a divide separating San Gorgonio from the Santa Timoteo-Santa Ana watersheds. This is probably the reason few prehistoric sites have been recorded within a half mile of the project area.

In 1929 US Route 99, a two-lane paved highway originating at the Mexican border at Calexico was created bringing traffic from Los Angeles to Indio. This opened as US60/70/99 (US395 added to in the 1950s) a mile southwest of the project site with the route running along Ramsey Street (Banning) and 6th Street (Beaumont) toward Redlands, with US60 branching off at Beaumont. This served the communities as the main east-west thoroughfare until Interstate 10 was constructed through the area about 1957-1958, replacing the two lane pavement with two lanes in both directions. The old highway was used as a frontage road (Desert Lawn Drive and Calimesa Boulevard) near the project site.

2.4 - Bureau of Land Management General Land Office Records Search

As noted above, the San Gorgonio Pass and San Timoteo Canyon areas were used as travel routes between Arizona and California at least beginning in the 1840s. In spring 1876 a section of Southern Pacific (SP) railroad track was completed between Los Angeles and Indian Wells (Lech 2004) and in that year construction stopped for the summer. At the time the SP operated wood burning locomotives and therefore needed wood, water and other materials to keep running on schedule. This forced the railroad to create stops and spur lines along the track to serve as supply ports, with paid caretakers staffing the larger stations, and local merchantmen for supplies. Because a checkerboard of odd-numbered Sections of public land were given to the railroads as incentive to build the line during that period (i.e., the Railroad Land Grants), persons could homestead the even numbered Sections with a railroad line nearby. Homesteaders eventually purchased railroad property once the railroad gained formal title: the railroads quickly sold these assets off.

MBA conducted an on-line search of the Bureau of Land Management (BLM) General Land Office (GLO) records on September 17, 2012. This search indicates that the North half of the Northeast quarter plus the Northeast quarter of the Northwest quarter (total of 172.6 acres) of Section 30 Township 2 South, Range 1 West was transferred from the federal land office to William L. Malcomb on September 19, 1898 through the Homestead Act (12 Stat. 392). The acreage located due north of the Malcomb property in the foothills was transferred to William Wolford on July 15 1915. Neither Malcomb nor Wolford are mentioned in Holmes' history of Riverside County (1912).

2.5 - Historic Aerial and Historic Map Review

MBA reviewed historical aerials from the Historicaerials.com and the Water Resource Institute at CSUSB websites as part of this study. 1932, 1939, 1959, 1967, and 1978 photographs are available. Our review shows that the project site has never exhibited a homestead or major structure and that the flat sections of the property had been plowed or cleared in 1932 and 1939. In 1959, the property exhibits evidence of very recent plowing and elimination of the center wash channel leading from Kehl Canyon. Vegetation on slopes leading to the flats was thick and the flats had been cleared of vegetation completely. Properties upstream were plowed and probably irrigated, while properties downstream exhibited structures and farming. By 1967, the plowed areas had increased in size but plowing on the flats in that year appears old. Much of the vegetation on the slopes has been reduced in quantity and thickness or was dying. Given that the water table was probably being lowered due to increased development and farming needs, the seeming loss of vegetation appears to be the result of lowering surface moisture. There is no evidence that the property has been used for grazing since the 1960s.

Topographic maps found on the www.historicaerials.com website were reviewed on September 19, 2012. The 1942 Perris, CA 10-minute map and the 1953 El Casco, CA 7.5-minute map showed that the project area lacked any platted structures and that while several wells were placed upstream of the

project site, none were located on the property itself. The existing water well located a few feet east of the project area was not platted as of the 1953 map date. The 1901 Elsinore, CA 125,000 scale quadrangle map also does not reveal any structures but it must be noted that the route through the Beaumont Plain was bypassed by most travel because the railroad traveled through San Timoteo Canyon only. Roads at that time were dirt and no paved highway existed from Calimesa/Yucaipa until the late 1920s.

SECTION 3: RESEARCH PARAMETERS AND METHODS

The primary purpose of a cultural resource pedestrian survey under CEQA Guidelines is to locate and document previously recorded or new cultural resource sites or isolates that are more than 45 years old within a project area, and to determine whether such resources will be or could be impacted by future development of the project. County guidelines associated with Phase I surveys can be downloaded from the Riverside County Transportation & Land Management Agency (TLMA) website. The version of the County guidelines referred to during this research effort was dated January 2010.

The project area must be examined using a block-transect technique, with 15 meter spacing at the maximum following County research guidelines. There were constraints to this procedure because the flats could be divided into one block of area for survey, then the finger ridges and steep hill surveyed as a second block. Any detected sites and isolates identified during the survey must be recorded on Department of Parks and Recreation (DPR) 523 forms and must be evaluated for significance during the environmental compliance process. Following County of Riverside guidelines, recordation and significance evaluation work may be completed during a subsequent archaeological Phase II study, upon authorization from the County archaeologist.

3.1 - Regional/Local Archaeological Regulations

The County of Riverside has created a series of guidelines and task lists for regional archaeologists to follow when completing CEQA-level cultural resources assessments. The County has identified four phases of archaeological assessments and resultant reports:

- Phase I: Initial Survey
- Phase II: Test or Evaluation
- Phase III: Mitigation or Data Recovery
- Phase IV: Monitoring

According to the Riverside County Planning Department Standard Scopes of Work, the Phase I report should consist of initial records, map or literature searches, a Sacred Lands File record check with the Native American Heritage Commission and an initial field inspection. If cultural resources are detected during the Phase I initial field inspection, these must be recorded on DPR 523 forms and must be evaluated for significance during the environmental compliance process. Following County of Riverside guidelines, recordation and significance evaluation work may be completed during a subsequent archaeological Phase II study, upon authorization from the County archaeologist.

A Phase II study is recommended by the County to gather additional information about the detected cultural resources for identification and evaluation purposes. If the results of a Phase II test or evaluation fail to find a resource significant or eligible for listing in the California Register of

Historical Resources, then this Phase II study may constitute sufficient mitigation for a resource. Phase III studies are recommended if a resource would be destroyed in the future or if significant value can be obtained from the resource. These studies generally occur when a resource has been found significant through the Phase II test and evaluation process, and the resource is threatened by impending destruction. A Phase IV report is required to present any information recovered as a result of mitigation monitoring programs, and is intended to ensure compliance with project conditions and to complete the archaeological data available for a specific resource or project area.

When completing these CEQA-level studies, the County has instructed regional archaeologists to adhere to specific rubrics for creating Phased reports. The requirements for a Phase I or initial survey archaeological report are found on the County Planning website and are frequently updated. The current Phase I report outline mirrors the OHP recommended ARMR report format, and includes sections to discuss project area location, current conditions, background history and findings. There are also sections to present research design, methods, records search results, pedestrian survey results, discussion of resources detected and recommendations for additional work, where necessary.

The County additionally requires paperwork regarding notifications to the Planning Department of forthcoming archaeological reports and significance checklists for specific project areas. All phased archaeological reports created for Riverside County review must be certified with the wet signature of a current Riverside County certified archaeologist. For an archaeologist to maintain their registry status, the archaeologist must complete a certification course and maintain a current MOU between the archaeologist or consulting firm and the County.

3.2 - Research Design

Previous research can provide a general basic understanding of cultural resources that might be found within the project area. General topic areas common to southern California prehistory include 1) prehistoric chronology, 2) subsistence strategies, 3) settlement patterning, 4) exchange, and 5) tool technology. Historic topic areas include 1) land use, 2) personal backgrounds, and 3) construction timetables. These general topics are contexts of research are difficult to address at the inventory level of analysis, but do provide a background for making statements about what is seen during an inventory. These topics allow for site type and content to be understood and evaluated within the framework of the local site area as well as in the broader context of the region.

For this reason, the goals of a Phase I survey study are to determine whether cultural resources are located within or near a defined project area, what type of resources are present or could be present, and to predict the chance for future discoveries of sites in the project area if construction-related impacts take place. Research assumptions were based upon the findings of the records search conducted at the EIC.

The research assumptions for the field survey consisted of the following:

1. The probability for detecting prehistoric archaeological sites on the modern ground surface of the former plowed fields appears to be "low" and sites on the unplowed finger ridges "moderate," based upon the number of known prehistoric resources within 1 mile of the project area. We have observed that prehistoric surface sites located on old farmland in California typically cannot be dated unless excavation takes place and buried radiocarbon samples are collected for C-14 dating.
2. The probability for detecting historic-era resources appears to be low, because no structures or the footprints of structures can be observed on aerial photographs and maps.

3.3 - Research Goals

The goal of this study was to determine whether cultural resources are located within the project area, determine whether any existing cultural resources should be considered significant resources, and develop specific mitigation measures that will address potential impacts to existing or potential resources. Thus, this study consisted of six distinct efforts:

1. Request of NAHC Sacred Lands File record search and contact with appropriate tribal groups and individuals.
2. Review of previous cultural resource sites and studies in the region.
3. Examination of archived aerial photographs, topographic maps, and road maps.
4. Evaluation of cultural resource sensitivity.
5. Conduct a block-transect survey of the project area.
6. Development of recommendations associated with potential impacts to existing cultural resources following County and CEQA Guidelines.

3.4 - Sites and Isolates

Prehistoric and historic cultural resource sites can vary in form and function from area to area. Prehistoric and historic cultural resources are defined as three or more items, such as lithics, stone tools, glass, cans, etc., that are not from a single source or material found within a 10-square-meter area. Historic sites that could qualify as significant in California are typically more than 45 years old or have the potential to be more than 45 years old at the time the project will be constructed. These definitions assume that items found in an area with a diversity of materials can represent more than a single activity at a location. Discrete components of a site, also known as loci, may be identified to represent repeated activity, such as milling stations, hearths, or isolated structures.

Recordation of each site and isolate will follow the most recent site recordation manual developed by the State Historic Preservation Office (SHPO) (dated March 1995). Photographs of the features or

individual artifact made during the recordation phase will be intended to show the basic qualities and location of the resource as a whole. Further research may be warranted once the potential impacts to such resources are identified.

3.5 - Record Search

3.5.1 - Information Center Search

The primary purpose of a cultural resource record search is to determine what cultural resources more than 45 years old have been recorded in the project area, and whether such resources will be or could be impacted by development. A records search at the EIC, which is located at the University of California at Riverside, was conducted to determine the existence of previously documented cultural resources in the County. The records search included current inventories of the:

- National Register of Historic Places (NRHP)
- California Register of Historical Resources (CR)
- California Historical Landmarks (CHL)
- California Points of Historical Interest (CPHI)
- California State Historic Resources Inventory (HRI)
- Archival maps for the City and County

3.5.2 - Native American Heritage Commission Record Search

Per County requirements, a request to the NAHC was sent in an effort to determine whether any sacred sites are located near the project area, as listed in their Sacred Lands File. Additional contact for the purpose of tribal comment was made with all appropriate tribal groups and individuals as named by the NAHC. MBA's efforts were associated with fact-finding only, and were not affiliated with formal government-to-government consultations as outlined by Senate Bill (SB) 18, a consultation the Riverside County Archaeologist will typically handle.

As of March 1, 2005, California Government Codes 65092; 65351; 65352; 65352.3; 65352.4; 65352.5 and 65560, formerly known as Senate Bill (SB) 18, require city and county governments to consult with California Native American tribes before individual site-specific, project-level land use decisions are made. In particular, this process applies to General Plan Amendments and adoptions of Specific Plans. The intent of this legislation is to provide all tribes, whether federally recognized or not, an opportunity to consult with local governments for the purpose of preserving and protecting their sacred places. The County of Riverside shall undertake the SB 18 consultations once the project is submitted to County Planning for review because Open Space is being delineated as part of this project.

SECTION 4: RESULTS

4.1 - Information Center Search

A cultural resource literature search was conducted on September 10, 2012 by the Author at the Eastern Information Center (EIC), which is located at the University of California, Riverside. A search radius of one mile around the project perimeter was used during this effort. To identify any historic properties, we examined the current inventories of the NRHP, CR, CHL, and CPHI. In addition, we copied the HRI and certain archival maps for the County to use to determine the existence of previously documented local historical resources.

Glenn (2006) reviewed the project site during preliminary analyses of Tract No. 36093. The Glenn team undertook a records search of the EIC files, then performed an "intuitive" survey of the project site in the Summer of 2006. The report was never submitted to the County because the project halted during the early part of the Recession. Thus, the study by Brown (1990) remains the only official study of the whole of the property.

According to the EIC files, numerous surveys on a parcel-by-parcel basis have taken place near the project area, but all but the Brown survey are located just outside the project area. Few cultural resources have been recorded near the project area (Table 1). Most of these are historic-era artifacts and/or historic features. Only one or two prehistoric resources have been identified since professional surveys began in the mid-1970s and all of these are closer to Beaumont and the headwaters of San Timoteo Canyon.

Table 1: Previously Recorded Cultural Resources

Primary #	Location	Type	>1 mile	>½ mile	>¼ mile	On-site?
P33-4115H	Section 34	Historic foundations and well	●			No
P33-6239	Section 31	Saahatpa marker (CHL marker)	●			No
P33-13717	Section 36	1950 house off Roberts Road		●		No
P33-14868	Section 34	1946 house and outbuildings	●			No
P33-14869	Section 34	Historic refuse		●		No
P33-14870	Section 30	1949-50 house and outbuildings			●	No
P33-15000	Section 36	1920 house	●			No
P33-15002	Section 36	Historic irrigation system and 1870 residence	●			No
P33-17122	Section 29	1938 Lantis property	●			No

4.2 - Native American Heritage Commission Record Search

On September 7, 2012, MBA sent a letter to the NAHC in an effort to determine whether any sacred sites are listed on their Sacred Lands File for this portion of the County of Riverside. Efforts were associated with informal consultation only, and are not affiliated with formal SB 18 consultations. The response from the NAHC was received on September 10, 2012. The NAHC indicated that no Native American cultural resources were known within ½ mile of the project area. To ensure that Native American planning concerns are addressed, letters to each of the eight listed tribal contacts were sent on September 12, 2012. As of the date of this report, one response has been provided this from Michael Contreras of the Morongo Band. Associated documents are attached in Appendix A.

4.3 - Cultural Survey Results

MBA archaeologists Michael Dice, M.A., Arabesque Said, and Andrea Stella surveyed the whole of the project area on September 13 (MD and ASt), September 14 (MD, AS and ASa) and September 27 (MD). Work on the 13th, included survey on the finger ridges and the small valley that runs west to east near the northern edge of the project site. September 14 work saw survey of all of the flats. September 27 saw the Author examine parcel number 413-322-0013 along the western margin of the project site.

Examination of topsoils during this work suggested that plowing had not taken place for at least 20 years in any part of the project site. The primary drainage has been heavily eroded to points about 20 feet deep in the southeast quadrant and vegetation that appears on the ridges in the 1940 to 1960 period has declined. Fire swept through the property perhaps 30 years ago and remnants of the native vegetation burned during that event can still be seen. Exposures of Pleistocene alluvial fan soils crop out at the western edge of the property on the low ridges between the Holocene alluvium. This material has the potential for fossils.

Although prehistoric deposits were expected on the finger ridges and unexpected on the flats due to historical plowing, no cultural resources were observed during the survey. Historic-era resources were not expected because none were observed on the historical aerials or the maps. These data suggest that the potential for impact to buried prehistoric resources should be considered "low," while the potential for impact to historic-era resources should be considered "none."

SECTION 5: SUMMARY AND RECOMMENDATIONS

5.1 - Summary

In accordance with CEQA and County of Riverside Archaeological Guidelines, MBA has assessed the effects of potential future development within the project area. The results of the cultural resource record search indicate that no previously recorded cultural resources are located on the property. The survey showed no cultural resources. Review of the whole of the data suggests that the potential for impacting buried prehistoric cultural resources during project-related earthmoving is "low" and the potential for impacting buried historic-era resources is none. Therefore, mitigation monitoring during project construction is not recommended.

5.1.1 - Accidental Discovery of Human Remains

There is always the small possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. Should this occur, Federal laws and standards apply including the Native American Graves Protection and Repatriation Act (NAGPRA) and its regulations found in the Code of Federal Regulations 43 CFR 10.

In the event of an accidental discovery or recognition of any human remains, California State Health and Safety Code Section 7050.5 dictates that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to CEQA regulations and Public Resources Code (PRC) Section 5097.98.

5.1.2 - Accidental Discovery of Cultural Resources

It is always possible that ground-disturbing activities during construction will uncover previously unknown, buried cultural resources. In the event that buried cultural resources are discovered during construction, operations shall stop in the immediate vicinity of the find and a qualified archaeologist shall be consulted to determine whether the resource requires further study. The qualified archeologist shall make recommendations to the Lead Agency on the measures that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with Section 15064.5 of the CEQA Guidelines. Potentially significant cultural resources consist of, but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area should be recorded on appropriate Department of Parks and Recreation (DPR) forms and evaluated for significance in terms of CEQA criteria.

If the resources are determined to be unique historic resources as defined under Section 15064.5 of the CEQA Guidelines, mitigation measures shall be identified by the monitor and recommended to the Lead Agency. Appropriate mitigation measures for significant resources could include avoidance

or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.

No further grading shall occur in the area of the discovery until the Lead Agency approves the measures to protect these resources. Any archaeological artifacts recovered because of mitigation shall be donated to a qualified scientific institution approved by the Lead Agency where they would be afforded long-term preservation to allow future scientific study.

In addition, reasonable efforts to avoid, minimize, or mitigate adverse effects to the property will be taken and the State Historic Preservation Office (SHPO) and Native American tribes with concerns about the property, as well as the Advisory Council on Historic Preservation (ACHP) will be notified within 48 hours in compliance with 36 CFR 800.13(b)(3).

SECTION 6: CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this archaeological report, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

Date: April 12, 2013 Signed: _____

Re: Sacred Lands File Search and Native American Contacts list for the proposed Sacred Lands File Search and Native American Contacts list for the proposed **"Shopoff-Tract Map 36093 Logistics Project ;"** located on about 250-acres in Cherry Valley; Riverside County, California

Dear Mr. Dice:

The Native American Heritage Commission (NAHC) conducted a Sacred Lands search based on the data provided and **Native American cultural resource sites were not identified** within one-half mile of the project site, the 'area of potential effect' (e.g. APE): you specified in any of the sections specified. Also the absence of archaeological fixtures and other cultural resource items does not preclude their existence at the subsurface level. In addition, please note; the NAHC Sacred Lands Inventory is not exhaustive and does not preclude the discovery of cultural resources during any project groundbreaking activity..

California Public Resources Code §§5097.94 (a) and 5097.96 authorize the NAHC to establish a Sacred Land Inventory to record Native American sacred sites and burial sites. These records are exempt from the provisions of the California Public Records Act pursuant to. California Government Code §6254 (r). The purpose of this code is to protect such sites from vandalism, theft and destruction.

In the 1985 Appellate Court decision (170 Cal App 3rd 604), the court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources, impacted by proposed projects including archaeological, places of religious significance to Native Americans and burial sites

The California Environmental Quality Act (CEQA – CA Public Resources Code §§ 21000-21177, amendments effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the CEQA Guidelines defines a significant impact on the environment as 'a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ...objects of historic or aesthetic significance." In order to comply with this provision, the lead agency is required to assess

whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect. CA Government Code §65040.12(e) defines "environmental justice" provisions and is applicable to the environmental review processes.

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries once a project is underway. Local Native Americans may have knowledge of the religious and cultural significance of the historic properties of the proposed project for the area (e.g. APE). Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e). We urge consultation with those tribes and interested Native Americans on the list that the NAHC has provided in order to see if your proposed project might impact Native American cultural resources. Lead agencies should consider avoidance as defined in §15370 of the CEQA Guidelines when significant cultural resources as defined by the CEQA Guidelines §15064.5 (b)(c)(f) may be affected by a proposed project. If so, Section 15382 of the CEQA Guidelines defines a significant impact on the environment as "substantial," and Section 2183.2 which requires documentation, data recovery of cultural resources.

The 1992 *Secretary of the Interiors Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Also, federal Executive Orders Nos. 11593 (preservation of cultural environment), 13175 (coordination & consultation) and 13007 (Sacred Sites) are helpful, supportive guides for Section 106 consultation. The aforementioned Secretary of the Interior's *Standards* include recommendations for all 'lead agencies' to consider the historic context of proposed projects and to "research" the cultural landscape that might include the 'area of potential effect.'

Partnering with local tribes and interested Native American consulting parties, on the NAHC list, should be conducted in compliance with the requirements of federal NEPA (42 U.S.C 4321-43351) and Section 106 4(f), Section 110 and (k) of the federal NHPA (16 U.S.C. 470 *et seq*), Section 4(f) of the Department of Transportation Act of 1966 (23 CFR 774); 36 CFR Part 800.3 (f) (2) & .5, the President's Council on Environmental Quality (CSQ, 42 U.S.C 4371 *et seq*. and NAGPRA (25 U.S.C. 3001-3013) as appropriate. The 1992 *Secretary of the Interiors Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Also, federal Executive Orders Nos. 11593 (preservation of cultural environment), 13175 (coordination & consultation) and 13007 (Sacred Sites) are helpful, supportive guides for Section 106 consultation. The NAHC remains concerned about the limitations and methods employed for NHPA Section 106 Consultation.

Also, California Public Resources Code Section 5097.98, California Government Code §27491 and Health & Safety Code Section 7050.5 provide for provisions for accidentally discovered archeological resources during construction and mandate the processes to be followed in the event of an accidental discovery of any human remains in a project location other than a 'dedicated cemetery', another important reason to have Native American Monitors on board with the project.

To be effective, consultation on specific projects must be the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors, in the opinion of the NAHC. An excellent way to reinforce the relationship between a project and local tribes is to employ Native American Monitors in all phases of proposed projects including the planning phases.

Confidentiality of "historic properties of religious and cultural significance" may also be protected under Section 304 of he NHPA or at the Secretary of the Interior discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C., 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APE and possibility threatened by proposed project activity.

If you have any questions about this response to your request, please do not hesitate to contact me at (916) 653-6251.

Sincerely,

Dave Singleton

Subject: **Native American Information Request Letter associated with the Tract Map #36093 Logistics Project, Community of Cherry Valley, County of Riverside, California. APN #407-220-004, -007, -008, -009, -014, -016, -017 and a portion of #413-270-013 (USGS *El Casco, CA.* topographic quadrangle)**

Dear Mr. Siva:

Michael Brandman Associates is about to complete a cultural resource survey of the Tentative Tract Map #36093 Logistics Project located in the western portion of the Community of Cherry Valley, California. The project is associated with the planned-for development of a logistics (warehousing) facility on the flatter southern half of the property. The hilly areas will remain Open Space.

This information request letter is **not associated with the SB18 process**, but is a document that shall be included in our cultural resource survey report. CEQA Guidelines and Section 106 of the National Historic Preservation Act of 1966 (NHPA) must consider the effects a project may have on historic properties. The definition of "historic properties" can include properties of traditional religious and cultural significance to Native American groups. To determine whether the proposed project may impact any historic properties, including traditional cultural properties, MBA has reviewed background information and consulted with entities such as the NAHC. The Native American Heritage Commission **did not identify any Native American cultural resource sites** in or within ½ mile of the project area, although we are aware that prehistoric sites do exist nearby.

We wish to ask if you have any information or concerns about this project area, and/or if the proposed project may have an impact on cultural resources that are important to you. Please feel free to contact me at 909.884.2255 ext. 1208 or my cell 714.742.0468 if you have any questions or information, or you may address and mail a response to my attention at the address below.

Sincerely,

Michael H. Dice, M.A., Senior Archaeologist
Michael Brandman Associates
621 E Carnegie Drive, Suite 100
San Bernardino, CA 92408

Michael Dice - RE: project sacred lands search recently sent

From: Mike Contreras <MContreras@morongo-nsn.gov>
To: Michael Dice <MDice@brandman.com>
Date: 9/19/2012 2:20 PM
Subject: RE: project sacred lands search recently sent

Yes, thank you. this would be Tract Map #36093, correct?

The Morongo Band will offer a response of "no known concerns" on this project. However we do ask to be immediately notified in the event of any inadvertent discoveries. Should any resources of cultural significance be uncovered during any grading or trenching, a plan of action should follow with the tribe's involvement. We do appreciate your efforts and respect for our cultural properties. For immediate contact my cell phone number is **951-201-1866**

Thank you!

MICHAEL CONTRERAS JR.

Subject: project sacred lands search recently sent

michael: MBA staff sent you a letter regarding a proposed project off cherry valley boulevard near I-10 last week. make sure to respond directly to me via letter faxed or mailed here. there are no known cultural resources on this property but I would appreciate a response.

thanks! :)

CORPORATE RESUME

Michael H. Dice, MA, RPA

Cultural Resource Manager

Overview

- 25+ years experience in Cultural Resource Management
- Master's degree, Anthropology – Arizona State University, Tempe. 1993
- Bachelor's degree, Anthropology – Washington State University, Pullman. 1986
- Registered Professional Archaeologist (RPA 2000)
- County-Certified Archaeologist in Riverside County (#101), the County of Orange, and the County of San Diego.

Michael H. Dice, MA, RPA, has more than 25 years experience performing record searches, archaeological surveys, archaeological site testing projects, and data collection projects on private and public lands in the Southwestern United States. He has authored or co-authored more than 200 Cultural Resources Inventory Reports required for CEQA and/or NEPA level documents. Approximately 30 of these have taken place under County of Riverside jurisdiction. His management experience within CRM involves producing proposals, hiring and managing field and office cultural resource personnel, writing draft and final reports to various Clients and Lead Agencies, and managing costs effectively. Michael has extensive experience with California Native American Tribes, having provided direct consultation and coordination with the Agua Caliente Band, Gabrielino tribal officials, Juaneño tribal officials, the Morongo Band, the Serrano Band, and the Temecula Band of Luiseno Indians (Pechanga).

Project Specific Archaeological Experience 2008-2012: Southern California Desert Areas

Cultural Resource Assessment of The Salton Sea Solar Project, Riverside County, CA. *Reese-Chambers Systems Consultants Inc.* (2009-2010)

Mr. Dice led an archaeological survey and protohistoric ceramic scatter assessment on approximately 480 acres just north of the Salton Sea in the County of Riverside. The purpose of the study was to evaluate seemingly vacant property as part of an analysis for potential impacts during construction of a new solar panel complex. Two sites were identified and will have to be Phase III collected prior to construction. Consultations with local Tribal Authorities took place. Accepted by the County, construction of the complex will probably begin in the winter 2011 and Mr. Dice expects to lead the cultural resource compliance team.

Cultural Resource Assessment of The Felicity Project, Imperial County, CA. *Reese-Chambers Systems Consultants Inc. Somis, CA. (*2010-2011)

Mr. Dice led an archaeological survey on approximately 400 acres located just north of the tiny community of Felicity in the County of Imperial. The purpose of the study was to evaluate seemingly vacant property as part of an analysis for potential impacts during construction of a new solar panel complex. Consultations with local Tribal Authorities took place. The report was submitted to the County in 2011 as part of an IS/MND package.

Cultural Resource Assessment of The Kings Solar I Project, Kings and Kern County, CA. *KingsSolar LLC, Pasadena, CA.* (2010)

Mr. Dice led an archaeological survey on approximately 400 acres located just north of the tiny community of Winterhaven in the County of Imperial. The purpose of the study was to evaluate seemingly vacant property as part of an analysis for potential impacts during construction of a new solar panel complex. Consultations with local Tribal Authorities took place. The report was submitted to the County in 2011 as part of a IS/MND package.

Cultural Resource Assessment of The Kings Solar II Project, Kings County, CA. ***GROW Holdings, Inc, Los Angeles, CA.*** **(2011-2012)**

Mr. Dice led an archaeological survey on approximately 2200 acres located about 10 miles southeast of Kettleman City in the County of Kings. The purpose of the study was to evaluate a set of cattle ranch parcels as part of an analysis for potential impacts during construction of a new solar panel complex. Consultations with local Tribal Authorities took place. The research is ongoing and is planned to be submitted as part of an EIR to the County of Kings in 2013.

Cultural Resource Assessment of The Indigo I and Indigo II Solar Project, Community of Desert Center, Riverside Kings County, CA. ***Tetra Tech EC., Irvine, CA.*** **(2012 and Project pending)**

Mr. Dice led an archaeological survey on approximately 2000 acres of former jojoba farm property north of the small community of Desert Center, Ca. The purpose of the study was to evaluate abandoned agricultural land as part of an analysis for potential impacts for future construction of a new solar panel complex. Consultations with local Tribal Authorities took place. The research is ongoing and is planned to be submitted as part of an EIR to the County of Riverside in late 2012.

Phase 1 Cultural Resource Assessment of the Badlands Landfill and Lamb Canyon Landfill Expansion Projects, Riverside County, California. ***Riverside County Waste Management Department*** **(2010)**

Mr. Dice led an archaeological survey on a total of 1600 acres adjacent to the existing Badlands Landfill and the Lamb Canyon Landfill in the County of Riverside. The purpose of the study was to evaluate adjacent property as part of an analysis for potential impacts during expansion of the Landfills. Several new resources were detected and recorded during the study. While RCWMD will not construct the expansion for several decades, all known cultural sites will be avoided when land development takes place in the site areas. Consultations with local Tribal Authorities took place and the reports shall support future EIR's

Cultural Resource Assessment, Phase II Historical evaluation and Phase IV Monitoring for the Sketchers Industrial Park Project, City of Moreno Valley, California. ***Highland-Fairview Operating Partners, LLC*** **(2005-2011)**

Mr. Dice led a Phase 1 survey of the Sketchers property in addition to other properties controlled by the Client in 2004, headed a team of cultural professionals performing historic building evaluations, then headed up a field crew of monitors during the earth-moving phase of complex construction in 2010. Wholly seen through by Mr. Dice, several historic era buildings were examined. Consultations with local Tribal Authorities took place and construction of the complex was recently completed.

Cultural Resource Assessment, Phase II Historical and Prehistoric Significance Evaluations for the World Logistics Center Specific Plan, City of Moreno Valley, California. ***Highland-Fairview Operating Partners, LLC*** **(2004-2012)**

A project that has spanned nearly 10 years, Mr. Dice had led a Phase 1 survey of the project area in many stages between 2005 and 2011, headed a team of cultural professionals performing prehistoric site evaluations and historic archaeological evaluations, which has been molded into a report for a program-level EIR. The report has been submitted to the EIR author and is expected to be approved by the City in the fall of 2012.

Project Specific Historical Architecture Experience 2008-2012.

Historic Building Evaluation of the Whitney Building **To Be Completed Summer 2012**
City of La Verne, CA.

MBA has been contracted to evaluate a structure originally built in 1925 for significance at the State (CEQA) level of analysis. The City of La Verne is considering a proposal to build new residential structures near the Whitney Building and it is unknown whether or not the structure is eligible for listing on the National, State or Local registers. We have established that the building is in fact eligible for the National Register, and we are currently defining how the structure may or may not be indirectly impacted by the proposed structure.

Historic Structure Evaluation of the Whitney Building **To Be Completed Fall 2012**
City of Los Angeles, CA.

MBA has been contracted to evaluate a set of small residential structures and an apartment complex built in the 1920's. The City of Los Angeles is considering a proposal to build new residential structures on the property. Current results, which shall support an IS/MND, are pending.

Historic Building Evaluation of the San Gorgonio Inn **Completed Summer 2010**
City of Banning, CA.

MBA has been contracted to evaluate a structure originally built in 1884 and rebuilt in 1930 for significance at the State (CEQA) level of analysis. The City is proposing to demolish the structure and the report will supported an EIR written by Ernest Perea of Romo Planning Group Inc., Covina. Mr. Dice performed a historic background assessment and developed a thematic context with which the structure could be evaluated against.

Historic Building Evaluation of the F&M Artesia Branch Bank **Completed December 2009**
City of Long Beach, CA.

MBA was contracted to evaluate a structure built in 1961 for significance at the State (CEQA) and City of Long Beach Historic Property level of analysis. The City had proposed to demolish the structure complex and our technical report supported an IS/MND written in City Format for the proponent, Jeffrey Tartaglino of Palm Desert Development. Mr. Dice performed a historic background assessment and developed a thematic context with which the structure could be evaluated against. Because the structure was found significant at the local level of analysis, the City required a photographic assay of the building: this was incorporated into the document. The City will likely allow the removal of the building through demolition.

Historic Building Evaluation of the Premiere Lanes Bowling Alley **Completed November 2009**
City of Santa Fe Springs, CA.

MBA was contracted to evaluate a structure built in 1960-61 for significance at the State (CEQA) level of analysis. The City had proposed to demolish the structure complex and our technical report supported an EIR written by Sandra Bauer of Bauer Consulting Inc., Irvine, CA. Mr. Dice performed a historic background assessment and developed a thematic context with which the structure could be evaluated against. The City will allow the removal of the building through demolition but save signage associated with the structure.

Historic Building Survey, Washington Boulevard Redevelopment **Completed Spring 2009**
City of Santa Fe Springs, CA.

MBA was contracted to conduct a historic building survey for a project area located in the City of Santa Fe Springs, County of Los Angeles. The Washington Boulevard Redevelopment project area is

located in the City of Santa Fe Springs side of Washington Boulevard, and is bisected by Sorensen Avenue. The purpose of the study was to identify those properties more than 45 year old that may be demolished during planned Redevelopment in the next 25 years. A program-level historic context was developed and existing properties preliminarily assessed against that historic context. The results showed that more 100 individual properties more than 45 years old were located in and near the project area. The evaluation of the historic context and existing properties will allow the City, for the first time, to recommend that the significance of old buildings be considered when undertaking redevelopment in the City limits.

Historic Building Survey, Consolidated Redevelopment **Completed Fall 2008**
City of Santa Fe Springs, CA.

MBA was contracted to conduct a historic building survey for a project area located in the City of Santa Fe Springs, County of Los Angeles. The Consolidated Redevelopment Project Area is located near Gateway Plaza at the intersection of Telegraph Road and Painter Avenue west of Carmenita Road. The purpose of the study was to identify those properties more than 45 year old that may be demolished during planned Redevelopment in the next 25 years. A program-level historic context was developed and existing properties preliminarily assessed against that historic context. The results showed that more 40 individual properties more than 45 years old were located in and near the project area.

Historic Resource Assessment and Phase II Recommendation **Completed 2006**
The Alfa Leisure Property, City of Chino, CA.

This study was a CEQA and NEPA-compliant assessment of the old Chino Sugar Mill, including an historic building survey and photographic assay. The results of the study showed that the structure was a locally significant structure but could not be saved within a reasonable monetary expenditure as the structure was completely unstable. Recommended that a photographic assay and additional historic analysis be undertaken before the structure would be allowed to be demolished.

ASR/HPSR for the Santa Ana Art Wall Project **Completed 2005**
OCTA Tracks/Santa Ana Depot at Santiago Street, City of Santa Ana, CA.

Served as Senior Project Archaeologist to perform an ASR/HRER/HPSR package for the City of Santa Ana for its Caltrans District 12 submission. Construction of the Art Wall was funded by, in part, by the Federal Highway Administration (FHWA). The project was not considered an undertaking exempt from federal cultural resource compliance as governed by Caltrans-FHWA Programmatic Agreement (PA) associated with Section 106 of the National Historic Preservation Act (36 CFR §800). The APE was established in consultation with Cheryl Sinopoli of District 12. Once the APE had been approved by Rail HQ, several unrecorded historic properties were evaluated. Work progressed with Caltrans staff guidance in a reasonable and responsive fashion. Our historic architectural specialist and co-author, Christeen Taniguchi assisted in developing the report. The project allowed interaction between MBA, Caltrans and SHPO, with successful results.

Appendix C:
Site Photographs Taken During Survey

THIS PAGE INTENTIONALLY LEFT BLANK

Typical view of an east-west finger ridge in the central portion of the project area. These ridges have not been ploughed and exhibit original soil strata, but all will be avoided by project-related construction.

View north along the easternmost parcel showing hills in relation to flats. These hillsides were generally too steep to survey safely, but will not be impacted during construction.

THIS PAGE INTENTIONALLY LEFT BLANK

View east in the central portion of the project site. The flats to the right were ploughed or chained using heavy machinery as recently as the 1970s; the integrity of the topsoils on these flats is destroyed.

Deep gully located in the project site, view west. In some places, this gully was 15 feet deep and has been carved during flash floods. The groundwater table in this area has dropped substantially since the 1950s, which has exacerbated the gully problem. The gully is dangerous, but where possible the sides of the gullies in the project site were inspected for cultural strata.

SECTION 1: INTRODUCTION

At the request of TSG-Cherry Valley L.P., Michael Brandman Associates (MBA) conducted a paleontological resource assessment on a project site totaling approximately 237 acres. The project site is known as the I-10 Gateway Center located near the Town of Cherry Valley, in unincorporated Riverside County, California. All lands within the area proposed for development are private and are under the local jurisdiction of the County of Riverside. The westernmost parcel of 8.79 acres is located in the City of Calimesa but the County will act as the Lead Agency.

Assessor's Parcel Numbers (APN) 407-220-004, 407-220-007, 407-220-008, 407-220-009, 407-220-014, 407-220-016, 407-220-017, 413-270-012, and 413-270-013 constitute the entirety of the project area. These properties are currently vacant. The flatter parts of these parcels were plowed in the 1920s or 1930s for the purposes of dryland farming. Some native vegetation remains on the finger ridges and the steeper hillsides.

This report is organized into sections and appendices, which are summarized as follows:

- Section 1 reviews the goals of this study.
- Section 2 summarizes the environmental setting.
- Section 3 provides paleontological records search results.
- Section 4 summarizes the project and provides management recommendations.
- Section 5 presents a reference list.
- Section 6 contains the project certification.
- Appendix A provides personnel qualifications.
- Appendix B provides required paleontological resource compliance documents.

MBA Director of Natural Resources, Kenneth J. Lord, Ph.D. requested a paleontological records check on September 10, 2012. The response was received on October 31, 2012, from Eric Scott, Curator of Paleontology at the San Bernardino County Museum (SBCM) in Redlands, California. Mr. Scott undertook a literature review and records search of the paleontology of the study area. All records search materials are on file at the MBA corporate office in Irvine, California. The project site was visited by Dr. Lord on September 13, 2012 and archaeological fieldwork took place on the site on September 13, 14, and 27, 2012 by a crew of three. No exposed fossils were encountered in any of the field survey efforts.

1.1 - Resource Assessment Goals

The goal of this study is to determine whether paleontological resources are located within the project area, what type of resources are present, and what type of resources could be present. Once this information is determined, the study will assess the significance of those resources, in order to

develop specific mitigation measures that will address potential impacts to such resources, once development begins. Thus, this study consisted of four distinct efforts:

1. Paleontological records search conducted by Eric Scott at the SBCM.
2. Paleontological Resources Assessment, including an analysis of the records search, to assess the types of resources that might be encountered and to place those resources within the context of established chronologies.
3. Evaluation of paleontological resource sensitivity.
4. Development of recommendations associated with mitigation monitoring and/or impacts to existing paleontological resources following California Environmental Quality Act (CEQA) Guidelines.

SECTION 2: ENVIRONMENTAL SETTING

2.1 - Project Location and Description

Situated in the northwest portion of the County of Riverside, the project area is located north of Interstate 10 (I-10), west of Beaumont and east of the City of Calimesa (Exhibit 1). The boundaries of the project area can be found on the El Casco, CA USGS 7.5-minute Topographic Quadrangle Map. The project is located in Section 30 of Township 2 South - Range 1 West (Exhibit 2). The project area includes nine parcels totaling 242.63 acres, which according to the County of Riverside Assessors website contains the following individual acreages for the following APNs

1. 407-220-004 (12.82 acres)
2. 407-220-007 (26.73 acres)
3. 407-220-008 (6.24 acres)
4. 407-220-009 (97.89 acres)
5. 407-220-014 (0.12 acres)
6. 407-220-016 (64.41 acres)
7. 408-220-017 (20.05 acres)
8. 413-270-012 (5.58 acres) in the City of Calimesa
9. 413-270-013 (8.79 acres) in the City of Calimesa

A modern aerial image of the project area has been provided herein (Exhibit 3).

The project site totals approximately 230 gross acres. Approximately 144 acres are proposed to be developed as a logistics center and the remaining 86 acres is proposed to remain as natural open space. The project consists of two (2) industrial buildings that are proposed to be designed as eligible for Leadership in Energy and Environmental Design (LEED) Certification and will total approximately 2,560,000 square feet (sq ft). Additional development on the project site includes up to 428 dock doors, private streets, natural washes, detention basins/bio swales, landscaping, a 200-foot drainage setback is planned along Cherry Valley Boulevard. Three access points will be provided off Cherry Valley Boulevard.

The structural facilities are planned to house a variety of industrial uses, including some that would be considered “high cube” type wholesale distribution users. Both industrial buildings will total approximately 39 feet in height. Building 2 will contain four offices located at each corner of the proposed building. Building 1 will contain an office on the southwest and southeast corner of the proposed building.

Equipment and commodities to be stored on the property include vehicles, trucks, trailers, and equipment associated with the industrial buildings; products and goods that will be distributed to retailers, wholesalers, or sold directly to consumers; maintenance equipment and machinery; office

supplies and equipment; and fuels for vehicles. Vehicle and equipment maintenance to be performed on the property includes routine vehicle maintenance, and maintenance and repair of equipment and machinery for operations.

Based on the proposed development plan, the project will not have a formal phasing plan but will develop according to market conditions and infrastructure system connections. The backbone infrastructure will be phased to provide incremental capacities capable of serving the level of development proposed during project buildout.

2.1.1 - Land Use

The project area is a large series of vacant parcels, parallel to Cherry Valley Boulevard. There is some abandoned agricultural development across Cherry Valley Boulevard with little other development, immediately adjacent.

2.2 - Environmental Setting

2.2.1 - Topography, Geology, and Soils of the Beaumont Plain

The project area is located within a geological formation known as the Beaumont Plain Fault Zone (Matti et al. 1992), and is located about two miles west of the low saddle that separates the San Gorgonio Creek watershed that flows into the Coachella Valley from the San Timoteo Creek watershed that flows into the Santa Ana River. The property is located in incised alluvium with surface flows heading toward the southwest and into the headwaters of San Timoteo Canyon. The project site lies between the northwestern portion of the San Jacinto Mountains and the San Timoteo Badlands, and lies along the southern foothills of the San Bernardino Mountains. The Plain is part of a large rift valley (graben), which has dropped between the two mountain ranges during the last 10 million years and then filled with alluvial sediment over the Pliocene/Pleistocene Epochs (Exhibit 4).

> During the Pliocene (5.33 to 2.58 million years ago [MYA]) and Pleistocene Epochs (2.58 MYA to 12,000 years before present [YBP]), the Los Angeles Basin sank many thousands of feet, while the San Jacinto Mountains rose considerably through compressional forces, and the Perris Block oscillated vertically (Woodford et al 1971). The Banning fault is the primary fault in the San Gorgonio Pass area and the idea that the faults lying between the two mountain ranges were once part of an ancestral San Andreas fault system (aka the *Vincent Thrust*) has been proposed (US Geological Survey Bulletin 845; http://www.data.scec.org/significant/banning.html). This combination of factors led to the deposition of hundreds of feet of alluvium in this region as the graben sank. This is why no bedrock in the project site was observed during the archaeological survey.

According to Scott (2012), the previous geological mapping (Rogers 1965, Morton 1999) indicates that the project area encompasses surface exposures of older Pleistocene deposits overlain in arroyos and gullies by a thin veneer of Holocene sediments consisting of alluvium (QA). Dibblee (2003)

maps the area as alluvial sand, gravel and clay on the flatter areas covered by residual soil (QA) with northeast to southwest trending ridges composed of alluvial gravel and sand intermixed with granitic and gneissic detritus from the San Bernardino Mountains at lower elevations (Qoa) and the San Timoteo Formation at higher elevations (QTsg) (Exhibit 5 and Exhibit 6).

SECTION 3: RESEARCH RESULTS

MBA Director of Natural Resources, Kenneth J. Lord, Ph.D., requested a paleontological records check on September 10, 2012. The response was received on October 31, 2012, from Eric Scott, Curator of Paleontology at the San Bernardino County Museum. Mr. Scott undertook a literature review and records search of the paleontology of the study area (Appendix B). The paleontological review showed that the project area is situated entirely upon surface exposures of Pleistocene older alluvium with a thin veneer of Holocene or recent alluvium. These deposits have a high potential to contain significant nonrenewable paleontological resources, and they are assigned a high paleontological sensitivity. Excavations into older Pleistocene alluvial sediments throughout the Inland Empire have previously yielded significant fossils of extinct plants and animals from the "Ice Age," including mammoths, mastodons, ground sloths, dire wolves, short-faced bears, saber-toothed cats, large and small horses, large and small camels, and bison (Jefferson 1991; Reynolds and Reynolds 1991; Woodburne 1991; Springer and Scott 1998; Scott 2010; and Springer et al. 1998 and 1999, 2007) as well as fossilized plant remains (Reynolds and Reynolds 1991; Anderson et al. 2002).

A search of the Regional Paleontologic Locality Inventory (RPLI) at the SBCM indicates that no paleontologic resource localities are recorded within the boundaries of the project area or within 1 mile in any direction (Scott 2012).

Review of sensitivity maps and reports obtained from the Riverside County Land Information System (RCLIS) search (Appendix B), indicate that the project area has a high paleontologic sensitivity designation of "A." This sensitivity designation, presumably, is based upon the Pleistocene age of the project area soils and their high paleontologic sensitivity when they exhibit a fine-grained lithology conducive to the preservation of fossil resources. The categorization of High Sensitivity A suggests that significant fossil remains could be encountered at or near the surface as well as at depth if conditions are conducive for fossil preservation.

In summary, the results of the paleontological records check obtained from the SBCM, the sensitivity maps, and text from RCLIS indicate that the project area has a determination of high paleontologic sensitivity at or slightly below the modern ground surface. Therefore, MBA recommends a monitoring program to mitigate impacts to potentially significant paleontological resources beginning at the modern ground surface in areas that have not been subjected to plowing in the past. If detailed geologic borings are available, the specific depths of the highly sensitive areas could be refined. These research findings were confirmed in the field in September 2012 when Dr. Lord conducted a brief field visit (September 13, 2012) in conjunction with a detailed archaeological survey conducted by a crew of three on September 13, 14, and 27, 2012. The crew was briefed on potential areas to examine with a focus on the north-south ridges along the northern margins of the site.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 4: SUMMARY AND RECOMMENDATIONS

The primary purpose of the paleontological analysis is to determine the potential for impacts to significant, nonrenewable paleontological resources in the project area. MBA has concluded that the project area has a high probability of containing paleontological resources potentially at the surface along the ridge margins of the project site. Therefore, MBA recommends a monitoring program to mitigate impacts to paleontologic resources. Many of the ridges that have Qoa and QTsg deposits are expected to be outside of the development footprint and monitoring may be limited.

Table 1: Recommended Paleontological Resource Mitigation Measures

Mitigation No.	Mitigation Text
PR-1	MBA recommends full-time monitoring of excavation activities except in the flatter areas where extensive plowing has churned deposits up to depths of 2 feet. Paleontologic monitors should be equipped to salvage fossils, as they are unearthed, to avoid construction delays, and to remove samples of sediments likely to contain the remains of small fossil invertebrates and vertebrates. Monitors must be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. If the principal paleontologist determines that the sediments present within the subsurface have low potential to contain paleontologic resources and low paleontologic sensitivity, then the full-time monitoring program should cease and a program of periodic monitoring should occur.
PR-2	Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates. Preparation and stabilization of all recovered fossils are essential to fully mitigate adverse impacts to the resources.
PR-3	Identification and curation of specimens into an established, accredited museum repository with permanent retrievable paleontologic storage. These procedures are also essential steps in effective paleontologic mitigation and CEQA compliance. The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities. Mitigation of adverse impacts to significant paleontologic resources is not complete until such curation into an established museum repository has been fully completed and documented.
PR-4	Preparation of a report of findings with an appended itemized inventory of specimens. The report and inventory, when submitted to the appropriate Lead Agency along with confirmation of the curation of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontologic resources.

Experience Summary

Dr. Lord has over twenty eight years of professional experience in environmental consulting, cultural resources management and environmental assessment of major transmission and development projects. In this capacity, he has managed multi disciplinary teams preparing ElSs and EIRs that have been used by the FERC, US Army Corps of Engineers and State of California agencies in licensing pipeline projects in California and the western United States. He has also been involved in management of the construction/ environmental compliance monitoring associated with a variety of development projects. Other experience includes assignments as project manager or deputy project manager for a variety of state and federal projects. His experience encompasses the reconnaissance, feasibility, and environmental impact aspects of a variety of project types. He is knowledgeable about California county environmental documentation procedures and regulations, as well as other federal and state environmental laws, regulations, and guidelines. He has prepared and supervised the preparation of EIRs, EISs and Biological Assessments in accordance with NEPA and CEQA rules and regulations.

As Director of MBA's Natural and Cultural Resources Departments, Dr. Lord oversees the operations and staff responsible for performing all cultural , historical and paleontological resource studies and field work, providing quality assurance and control, and performs the more complex and sensitive natural resource planning, cultural and paleontologic studies and related client services.

Recent Project Experience

Paleontologic Reports

Paleontological Resources Assessment UP Homes TTM 34287, Perris, Riverside County, California. Project Manager and author of a paleontological assessment of 7.14 acres in the City of Perris. A field investigation was completed and a records search determined that the property had the potential to contain significant Pleistocene-aged fossils at depth. Mitigation recommendations were prepared for the project site.

Paleontologic Monitoring and Reports

Spring Mountain Ranch Cultural and Paleontological Resources Monitoring, Highgrove, Riverside County. Project Manager for an extensive mitigation monitoring program for both cultural resources and paleontological resources in the Highgrove area of unincorporated Riverside County. Approximately 785 acres were monitored for both cultural resources and paleontological resources. Mark Roeder of PaleoEnvironmental Associates conducted the original field examination of the property with the Project Manager. Excavations occurred to depths of 60 feet and no paleontological resources were encountered. A summary report on the paleontological efforts were submitted to the applicant and are on file with MBA.

Granite Homes Garbani Road Project – Paleontological Monitoring, Menifee, Riverside County. Project Manager and part-time monitor for an approximately 38 acre project that required paleontological monitoring on specific areas of a project site with the potential to contain Pleistocene fossils. Monitoring occurred over a 2 month period, with a total of 19 days of monitoring. No suitable geological deposits were encountered on the project site.

Phase I Cultural Resources with Paleontologic Component

Kona Road III Project Cultural Resources Survey, French Valley Area. Project Manager for a Phase I cultural resources survey and paleontological review of a 4.65-acre property in the French Valley Area of unincorporated Riverside County, California, for John Laing Homes.

Newport Road Project Cultural Resources Assessment, Menifee Area. Project Manager for a Phase I cultural resources assessment and paleontological records review in Menifee Area, County of Riverside, California, for Granite Equities, LLC.

Taylor-Woodrow Ivy House Project Cultural Resources Assessment, Murrieta. Project Manager for a Phase I cultural resources assessment and paleontological records review in Murrieta, Riverside County, California, for Taylor Woodrow Homes.

Phase I Cultural Resources Survey Report for Watson Land Company, near Euclid and Bickmore Avenue, Chino, County of San Bernardino, California. Project Manager and author of report of a 60 acre parcel in Chino. Extensive paleontological recommendations were made and follow-up surveys and field visits were made at appropriate disturbance depths to check for potential paleontologic resources. This project is on-going.

Cultural Resources Survey Report, San Jacinto. Project Manager for a Phase I cultural resources survey report and paleontological records review for tentative tract 33862 in San Jacinto, County of Riverside, California, for JD Pierce Company.

Pigeon Pass Property Cultural Resources Assessment, Moreno Valley. Project Manager for a Phase I cultural resources assessment and paleontological records review of 37.8-acres in Moreno Valley, Riverside County, California, for Pacific Land Company.

Cultural Resources Assessment, French Valley. Project Manager for a Phase I cultural resources assessment and paleontological records review of Tract 34150 in French Valley, County of Riverside, California, for Granite Equities, LLC.

Menifee Farms Project Cultural Resources Assessment, Menifee Valley. Project Manager for a Phase I cultural resources assessment, Phase II archaeological test and paleontological records review of a 26.14-acre property in Menifee Valley, Riverside County, California for Granite Equities, LLC.

Palmdale Business Center Project Cultural Resources Assessment, City of Palmdale. Project Manager for a Phase I cultural resources survey and paleontological records review for tentative tract 47193 in the City of Palmdale, Los Angeles County, California for Palmdale Business Center, LP.

Victoria 316 Project Cultural Resources Assessment, Victorville. Project Manager for a Phase I cultural resources survey and paleontological records review for tentative tract numbers 17341 and 17356 in Victorville, San Bernardino County, California for Pulte Homes. Prepared a site-specific paleontologic monitoring plan for the project site.

Van Daele Homes Victorville Acres Project Cultural Resources Survey, City of Victorville. Project Manager for a Phase I cultural resources survey and paleontological records review for tentative tract 16847 in the City of Victorville, San Bernardino County, California for Victorville Acres, LLC. Prepared a site-specific paleontologic monitoring plan for the project site.

Van Daele Homes Foxfire Ranch Cultural Resource Survey, City of Victorville. Project Manager for a Phase I cultural resources survey and paleontological records review, including sensitivity statements on the paleontology of the 65-acre property at tentative tract 16574 (including parcel 3094-131-02) in the City of Victorville, San Bernardino County, California for Victorville Acres, LLC. Prepared a site-specific paleontologic monitoring plan for the project site.

Subject: **Request for a Paleontological Resources Records Search for the I-10 Gateway Job Center, Unincorporated Riverside County near Cherry Valley, California. (USGS El Casco, CA. quad)**

Dear Eric:

I am in need of a paleontological records search on approximately 228 acres in Riverside County, north of I-10 between Calimesa and Cherry Valley. Information on the location is provided below and by the attached map. The location is on the El Casco USGS quadrangle in the north half of Section 30; T2S; R1W: T4S.

Once the results have been determined, please send the results by email to klord@brandman.com, and mail MBA a hard copy to the address below. If you have any more questions or need to speak with me, please feel free to call me at 714.508.4100 ext 1035. Thank you for your time and effort.

Sincerely,

Kenneth J. Lord, Ph.D., RPA

re: **PALEONTOLOGY LITERATURE AND RECORDS REVIEW, I-10 GATEWAY JOB CENTER, CHERRY VALLEY REGION, RIVERSIDE COUNTY, CALIFORNIA**

Dear Dr. Lord,

The Division of Geological Sciences of the San Bernardino County Museum (SBCM) has completed a literature review and records search for the above-named property in the Cherry Valley area of Riverside County, California. The study area is located in the northern half of section 30, Township 2 South, Range 1 West, San Bernardino Base and Meridian, as seen on the El Casco, California 7.5' United States Geological Survey topographic quadrangle map (1967 edition, photorevised 1979).

Previous geologic mapping (Rogers, 1965) indicates that the proposed project property is located primarily upon surface exposures of Pleistocene older alluvium, overlain over portions of the property by a thin sedimentary veneer of Holocene or recent alluvium. The Holocene sediments are too geologically young to have potential to contain significant fossil resources, and so are assigned low paleontologic sensitivity. In contrast, surface and subsurface Pleistocene sediments have high potential to contain fossil resources, and so are assigned high paleontologic sensitivity. Older Pleistocene alluvial sediments elsewhere throughout the Inland Empire have frequently been reported to yield significant fossils of extinct animals and plants from the "Ice Ages" (Jefferson, 1991; Reynolds and Reynolds, 1991; Anderson and others, 2002; Springer and others, 2009, 2010; Scott, 2010). Vertebrate fossils recovered from these Pleistocene sediments represent extinct taxa including mammoths, mastodons, ground sloths, dire wolves, short-faced bears, sabre-toothed cats, large and small horses, large and small camels, and bison (Jefferson, 1991; Reynolds and Reynolds, 1991; Anderson and others, 2002; Springer and others, 2009, 2010; Scott, 2010).

For this review, I conducted a search of the Regional Paleontologic Locality Inventory (RPLI) at the SBCM. The results of this search indicate that no previously-known paleontologic resource localities are recorded by the SBCM from the study area, nor from within at least one mile in any direction. The nearest recorded paleontologic resource localities, located >3 miles to the west, southwest and south, are recorded from surface and subsurface exposures of the fossiliferous San Timoteo Formation, and so have little relevance to the paleontologic sensitivity of the Pleistocene alluvial sediments present within the boundaries of the land tracts under consideration herein.

Recommendations

The results of the literature review and the check of the RPLI at the SBCM demonstrate that excavation in conjunction with development has high potential to adversely impact significant nonrenewable paleontologic resources present within the boundaries of the proposed study area. A qualified vertebrate paleontologist must be retained to develop a program to mitigate impacts to such resources. This mitigation program should be consistent with the provisions of the California Environmental Quality Act (Scott and Springer, 2003), as well as with regulations currently implemented by the County of Riverside. This program should include, but not be limited to:

1. Monitoring of excavation in areas identified as likely to contain paleontologic resources by a qualified paleontologic monitor. Areas requiring monitoring include all previously-undisturbed Pleistocene older alluvial sediments present, at the surface or at depth, within the boundaries of the property. Paleontologic monitors should be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors must be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced or eliminated if the potentially-fossiliferous units described herein are determined upon exposure and examination by qualified paleontologic personnel to have low potential to contain fossil resources.

2. Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates. Preparation and stabilization of all recovered fossils are essential in order to fully mitigate adverse impacts to the resources (Scott and others, 2004).

3. Identification and curation of specimens into an established, accredited museum repository with permanent retrievable paleontologic storage. These procedures are also essential steps in effective paleontologic mitigation (Scott and others, 2004) and CEQA compliance (Scott and Springer, 2003). The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities. Mitigation of adverse impacts to significant paleontologic resources is not complete until such curation into an established, accredited museum repository has been fully completed and documented.

4. Preparation of a report of findings with an appended itemized inventory of specimens. The report and inventory, when submitted to the appropriate Lead Agency along with confirmation of the curation of recovered specimens into an established, accredited museum repository, would signify completion of the program to mitigate impacts to paleontologic resources.

Dear Mr. Rupp:

Please find enclosed our review of the grading plan for your proposed I-10 Gateway Job Center in the Cherry Valley area of the County of Riverside, California. This report will be suitable for submission to the reviewing agency, the County of Riverside Planning Department and other parties, for budgeting purposes, earthwork volume calculations and other needs.

We appreciate the opportunity to provide our services to you and if you have any questions or require additional information, please contact the undersigned.

Respectfully submitted,
GINTER & ASSOCIATES, INC.

1.0 Introduction

This report has been prepared by Ginter & Associates, Inc. (G&A) to provide a grading plan review of the Parcel Map No. 36093 prepared by Hunsaker & Associates, Inc. at a scale of 1"=100' dated 12/08/08 and is known as the I-10 Gateway Job Center. The geologic and geotechnical conditions of the site, as well as recommendations for grading and foundation design, are presented herein as guidelines for construction of the project.

In order to provide a comprehensive presentation of the data, this report contains data from previous subsurface investigations by C.H.J. Inc., (8/3/05 and 8/15/05) as well as Neblett & Associates, Inc.'s (N&A) fault investigation report (9/22/08). This report has amalgamated all geologic and geotechnical engineering data, as well as the laboratory data, as contained herein on the geotechnical maps, cross-sections and Appendix I through VII.

1.1 Site Description

The site has an irregular rectangular shape consisting of 230 acres, approximately 160 acres scheduled for development, in the Timoteo Badlands near the western portion of the San Gorgonio Pass and the southern flank of the San Bernardino Mountains. It is located just east of the Interstate 10 on the north side of Cherry Valley Boulevard. The site is accessible via unpaved, graded roads (Figure 1).

The Northern half of the site is characterized by badlands topography with narrow ridgelines, steep flanks and narrow valleys trending northeast-southwest.

The southern half is relatively flat with subdued ridgelines in the north trending west-southwest and merging into a flat alluvial plain trending east-west.

Vegetation consists predominately of native grasses with sage scrub and occasional scrub oak in the north. The southern portion of the site appears to have been cultivated for agriculture in the past.

A water line and fiber optic cable transverse the northern portion of the site in an east-west trend with several utility vaults. Some cuts, fills and roadways are associated with this easement.

1.2 Proposed Development

The I-10 Gateway Job Center consists predominately of two buildings – Building 1 covers 1,577,400 sq. ft. and building 2 covers 930,060 sq. ft. A parking lot is planned for these buildings. A landscape soft-bottom drainage channel and detention basin are planned along Cherry Valley Boulevard. Two debris basins are also proposed in the northwest portion of the site within two main tributary draws.

All slopes are proposed at ratio of 2:1 (horizontal to vertical) or flatter with the highest cut slope in the range of 110ft. and the highest fill slope at 75 ft.+ located along the eastern perimeter.

1.3 Summary of Previous Investigations

C.H.J. Inc. performed a site specific subsurface investigation of faulting with a report dated Aug. 3, 2005. They utilized aerial photo lineament analyses, geologic field mapping, excavation of 5 trenches totaling 2,215 lineal feet from 15 to 21 ft. deep and 4 slope cuts totaling 2,600 lineal ft. The results of this investigation identified two fault splays associated with the Cherry Valley Fault Zone trending northwest to southeast across the site. They determined the southern branch of the two faults to be inactive. The age of activity of the north branch could not be determined.

C.H.J. Inc. provided a geotechnical investigation report dated Aug. 15, 2005 that evaluated the geotechnical conditions at the subject site and provide geotechnical recommendations for design and construction of the proposed development (Aug. 15, 2005). This investigation included 35 hollow stem auger borings, 33 cone penetrometer tests (CPT's), and laboratory analyses.

It is noteworthy that immediately east of the subject site, Leighton Consulting, Inc. (2004) and Leighton and Associates, Inc. (2006) performed geotechnical and fault investigations for the Danny Thomas portion of the Sunny-Cal Egg Ranch Project. G&A has reviewed these reports due to their proximity and similarities in faulting and geologic materials.

N&A performed a supplemental fault investigation and presented the findings in their report dated September 22, 2008. N&A utilized the data from C.H.J.'s Subsurface Investigation of Faulting report, enhanced the data base with additional fault trenches and geologic mapping, and further delineated the South Branch of the Cherry Valley

CVAR_09693

Fault. As a result of this investigation, the developer positioned the buildings and other critical structures outside the setback zone for the South Branch of the Cherry Valley Fault within the subject site.

G&A recently completed a report dated October 23, 2012, titled "Infiltration Rate Evaluation for the I-10 Gateway Center" to determine the feasibility of the proposed infiltration basins.

2.0 Geomorphic Setting

In order to supplement the subsurface investigation by C.H.J. Inc., N&A excavated 4 additional hollow-stem auger borings ranging in depth from 58.5 ft. to 71.5 ft. Continuous logs of the borings were recorded during drilling by a staff geologist from this firm. Relatively undisturbed samples were obtained by driving a split-spoon ring sampler at selected levels. The number of blows required to advance the sampler a total of 18 inches in 6 inch increments were recorded on the boring logs. Undisturbed as well as bulk samples of typical soil types were noted on the logs and returned to the laboratory in sealed containers for testing and evaluation. The boring logs are included in Appendix II.

The reviewer is referred to N&A's Supplemental Fault Investigation report (9/22/08) for details of the fault trenches. N&A also provided a grading review report on the site dated 4/3/09. They excavated 4 hollowstem borings from 58-76 ft. in depth.

G&A excavated 4 pits approximately 25 ft. in depth and a hollowstem boring to 46 ft. in the proposed infiltration basins to determine rates of infiltration.

3.0 Geologic Setting

3.1 Regional Geologic Setting

The site is located near the boundary of the northeastern Peninsular Ranges and the southeastern Transverse Ranges consisting of the San Jacinto Mountains and the San Bernardino Mountains respectively. The northeastern Peninsular Ranges are part of the Southern California Batholith which is comprised of Paleozoic to Mesozoic age igneous, metasedimentary and metavolcanic rock types overlain un-conformably by non-marine clastic sediments of late Tertiary and Quaternary age.

The northwesterly trend of elongate ranges and valleys of this portion of the province are terminated abruptly by the general east-west grain of the Transverse Ranges.

The southeastern portion of the Transverse Ranges contain the San Bernardino Mountains which have been uplifted along the San Andreas and Banning Faults on the south and along several steeply dipping reverse faults on the north.

The subject site is situated at the juncture of the Transverse Range and the Peninsular Range in the western end of the San Gorgonio Pass Area. (Figure 2). In this area, the Mojave Desert segment and the Coachella Valley segment of the San Andreas Fault Zone step left from each other and this fault zone becomes a complex combination of strike-slip faults and thrust and tear faults that include the Banning Fault and the San Gorgonio Valley Fault Zone. The Cherry Valley Fault Zone of the subject area is considered a western extension of the San Gorgonio Pass Fault Zone (Matti and Morton (1993).

The site is also located in the "Badlands" area of relatively low hills southeast of Calimesa characterized by narrow ridge lines and steep-walled flanks comprised predominately of the San Timoteo Formation within the Peninsular Ranges province (Figure 3). This Plio-Pleistocene age sedimentary unit consists of fluviatile sandstones, and gravels with minor lacustrine siltstones. The floor and edges of the San Gorgonio Pass trough consist of dissected old alluvial terrace deposits and younger alluvial sands and gravels. These units are present in the southern portion of the subject site.

3.2 Regional Tectonic Setting:

The tectonic setting of southern California is dominated by the northwest-trending San Andreas Fault and its sister faults which have a right-lateral movement pattern between the North American Plate and the Pacific Plate. Local compression and/or extension as a result of the translational motion along this plate boundary has formed left-lateral, reverse, normal and blind thrust faults.

3.2.1 San Andreas Fault:

The main strand of the San Andreas Fault in southern California has been divided into two segments – the Mojave Desert segment separating the San Bernardino Mountains from the San Gabriel Mountains, and the Coachella Valley segment separating the Peninsular Ranges from the San Bernardino Mountains (Matti and Morton, 1993). The main strand deflects west in the San Gorgonio Pass area where the fault zone becomes

CVAR_09694

more complex and does not have a clean, currently active, throughgoing fault break but is a combination of older strike-slip faults and newer thrust and tear faults (Treiman, 1994). The Banning and San Gorgonio Pass Faults – including the Cherry Valley Fault Zone, are part of this complex fault system in the San Gorgonio Pass area.

The Coachella Valley segment splits into two principal strands as it approaches the San Bernardino Mountains. The most northern has been designated as the North Branch of the San Andreas Fault by Diblee (1975), the Mission Creek Fault by Allen (1957), and the Coachella Valley Segment of the San Andreas Fault by Matti et al. (1992). This strand merges to the northwest into the Mill Creek and Mission Creek Faults (Figure 2). The southern strand of the Coachella Valley segment is designated as the South Branch of the San Andreas Fault by Dibblee (1975), the Banning Fault by Allen (1957), and the Coachella Valley segment of the Banning Fault by Matti et al. (1992). Upon its approach into the San Gorgonio Pass it veers westward (Figure 2).

3.2.2 San Gorgonio Pass Fault Zone:

This zone is characterized by discontinuous reverse and thrust faults and associated tear faults (Treiman, 1994) generally located at the base of the San Bernardino Mountains (Figure 2). The San Gorgonio Pass Fault Zone includes, from the west to east, the Cherry Valley Fault Zone, a fault along the toe of the Banning Bench, and a northeast-trending segment crossing the lower part of the Millard Canyon Fan.

The Cherry Valley Fault Zone in the subject site's vicinity has been mapped by Matti and Morton (1974-91) as two traces. This fault zone has been mapped by various workers predominately as two sub-parallel faults which merge to the east to form one trace near the eastern property boundary (Figure 2) and then veers northeast, displacing remnants of a mid –to-late Pleistocene fan (Treiman, 1994).

East of the subject site, the Cherry Valley Fault becomes the San Gorgonio Pass Fault Zone and is characterized as a sinuous trace forming several discontinuous scarps on the older fan mid-Pleistocene fan surfaces (Matti and Morton, 1993), Farther east, the faults step southward from the range from forming the Highland Springs scarp and the toe of the Banning Bench. Matti et al. (1993) infer northwest-trending, right-lateral tear faults in this area. (Figure 2). This fault zone continues northeast as a thrust fault where it eventually merges with the Banning Fault near Gorgonio Canyon.

3.2.3 Banning Fault:

The Banning Fault is considered an ancestral trace of the San Andreas Fault (Allen, 1957;

Matti et al., 1992) which has been inferred from the Indio Hills to the San Jacinto Fault (Figure 2). During late Cenozoic time the Banning Fault was principally a right-lateral fault, but it has since responded mainly to compressional tectonics in Gorgonio Pass and continuing as a strikeslip fault only to the east (Matti and Morton 1993).

This fault is located approximately ¼ mile north of the subject site where it consists of a prominent high-angle trace which separates Pleistocene San Timoteo Formation on the south from granitic rock to the north (Figure 3). Displacement in this area is indicated as a strike-slip by Matti et al. (1992).

East of Cabazon, the Banning Fault represents a branch of the Coachella Valley segment of the San Andreas Fault and is considered active.

3.2.4 Mill Creek Fault:

This branch of the San Andreas Fault (the "North Branch" of Diblee, 1964) is a major structural boundary of basement rock types separating predominately granitic rocks along the northeast side from predominately gneissic rocks on the southwest side. The Mill Creek Fault is located approximately 10 miles north of the subject (Figure 2). Matti et al. (1993) believe that this strand is no longer an active part of the San Andreas Fault Zone, although it may have been locally reactivated by dip-slip movement.

3.2.5 Beaumont Plain Fault Zone:

Matti et al. (1993) identified four north-northwest trending normal faults which terminate near the southeast corner of the subject site (Figure 2). They are considered an extensional zone of faults irregularly expressed as scarps in mid-Pleistocene and older surfaces and are considered inactive (Treiman, 1994).

3.2.6 San Jacinto Fault:

The San Jacinto Fault is located approximately 6 miles southwest of the site (Figure 2) and consists of a system of northwest-trending, right-lateral, strike-slip faults. This fault traverses rocks of Peninsular Ranges type and the alluviated San Bernardino Valley before entering the southeastern San Gabriel Mountains (Figure 2). There the fault splays into several sub-parallel strands that traverse rocks of Peninsular Ranges type and San Gabriel Mountains type (Matti and Morton, 1993).

The San Jacinto Fault is the closest known active fault to the site and is considered the most influential with respect to ground shaking and rupture. More large historic

CVAR_09695

earthquakes have occurred on the San Jacinto Fault than any other fault in Southern California (Working Group on California Earthquake Probabilities, 1988).

3.2.7 Historical Seismicity:

A large earthquake ruptured the northern reaches of the San Bernardino segment of the San Andreas Fault on December 8, 1812 which has been inferred by Jacoby et al. (1987) using dendrochronological evidence, and by fault trenching by Fumal et al. (1993) at Wrightwood. This event may have ruptured into the San Bernardino Valley (Fumal, 1993).

Another major event known as the great 1857 Fort Tejon earthquake ruptured the Mojave segment of the San Andreas Fault. In 1948, a magnitude 6.5 earthquake ruptured the Coachella Valley segment of the San Andreas Fault in the Desert Hot Springs area.

An earthquake of magnitude 5.9 occurred on July 8, 1986, 10 km. northwest of North Palm Springs. Kahle and others (1987) indicated the epicenter near the Mission Creek fault with most of the associated surface faulting occurring along the Banning Fault with minor ruptures along Mission Creek and Garnet Hill Faults.

The Working Group of California Earthquake Probabilities (1988) indicate 7 magnitude 6.0 or greater earthquakes occurring on the San Jacinto Fault since 1899. Two of these include the magnitude 6.5 earthquake near Lytle Creek in 1899 and 6.2 magnitude event in Loma Linda in 1923.

Figure 2 (from Matti et al. 1992) presents the modern tectonic regime illustrating relations between faults and crustal blocks in the vicinity of the south-central Transverse Ranges.

3.3 Site Geology:

The main geologic units within the site include the Plio-Pleistocene San Timoteo formation in the northeast, and old alluvium of an old dissected alluvial fan in the southwest, with young alluvium along the valley floors. Structurally, the site is dominated by two splays of the Cherry Valley Fault – the North Branch and the South Branch which transect the site in a northwest to southeast trend (Figure 4). The South Branch generally places the San Timoteo Formation in fault contact with the older alluvium, except in the southeast where it juxtaposes older alluvial units against one another.

In some of our fault trenches, the old alluvium can be separated into a younger and older unit. These have not been differentiated on the geologic map (Figure 4).

Colluvium is the loose heterogeneous, and incoherent mass of soil material and rock fragments deposited by sheetwash, or slow continuous downslope creep collecting at the base of gentle slopes and hillslides. Colluvium mantles the slope of the site but is generally less than 2 ft. in thickness and therefore has not been delineated on Figure 4.

Undocumented artificial fill is present as backfill for the fault trenches of former investigations as well as this investigation. Artificial fill is also present with and in the vicinity of the San Gorgonio Pass Water Agency Pipeline easement that transgresses the northern portion of the site. Some of our fault trenches indicate that past agricultural activities and trenching have spilled fill along the edges of the flat-topped ridges in the southern half of the site.

The geologic units mapped at the site are discussed below in order from youngest to oldest.

3.3.1 Undocumented Fill (afu):

This unit has been delineated as shown on Figure 4. Where observed, this unit consists of a heterogeneous mixture of pebbly sand, silty sand, sandy silt, and coarse sand with cobbles and an occasional boulder. In addition to the minor undocumented fills within the fault trenches, spill fills associated with the former investigator's slope cuts are evident downslope. Historic aerial photo analyses and trenching have revealed that an east-west trending ridge located near the eastern property boundary has been cut and "flat-topped" for agricultural purposes. This grading occurred near CHJ Trench "T-4" and extends westerly to the ridge terminus, west of Neblett Trench NT-2. In addition, a significant undocumented canyon fill was placed southsoutheast of NT-5. This fill was likely placed concurrently with aforementioned ridge-top cut using the spoils generated from same.

3.3.2 Younger Alluvium (Qya):

Younger alluvial units outcrop in the active drainages which generally trend southerly to southwesterly onsite. The materials were only exposed in one of the Fault study trenches (NT-4, at its westerly end)). In NT-4, these younger alluvial materials consisted of silty sands and lesser gravelly sands. Local outcrops within active drainages reveal a highly variable lithology for this unit, which is consistent with the deposition of finer materials during relatively quiescent periods and very coarse materials during periodic storm events.

CVAR_09696

3.3.3 Older Alluvium (Qoa):

Older alluvial units onsite consist of reddish brown clayey sands and yellowish brown silty sands. Both units have frequent gravel and gravelly sand lenses. The reddish brown clayey sands are highly oxidized and re-mineralized, suggesting a significant difference in age. In the fault trenches, where these units could be differentiated, they have been denoted as Qoa1 and Qoa2. These units are usually massive to poorly-bedded with localized well-bedded gravels. Where bedded, the units displayed horizontal or near horizontal bedding except where proximal to faulting, where dips of up to 45 degrees were observed.

3.3.4 San Timoteo Formation (Qtst):

The San Timoteo Formation is located primarily northeast of the South Branch of the Cherry Valley Fault (Figure 4) and consists predominately of cobble-boulder conglomerate with minor inter-bedded fine to medium sandstones. The conglomerate matrix is generally moderately to well-cemented and the inter-bedded sandstones are relatively thin compared to the thick massive conglomerates. Clasts are moderately weathered to decomposed and consist of granodiorite, greenstone, quartzite and monzogranite from the adjacent Transverse Ranges. The unit is generally matrix supported with localized clast supported lenses, and is massive to poorly-bedded.

Structurally, beds dip at shallow angles to the southwest except near the North Branch of the Cherry Valley Fault and other faults in the northeast portion of the site where beds dip nearly vertical.

These fluviatile sediments were deposited during the Pliocene and Pleistocene time when the depositional basin was subsiding, uplift of the San Bernardino and San Jacinto Mountains was occurring, and movements within the San Andreas and San Jacinto fault systems was taking place (Morton & Matti, 1993).

3.4 Site Faults:

Two main faults, the north and south branches of the Cherry Valley Fault Zone (CVFZ) have been mapped onsite. Though these two main breaks help define the zone, lineaments and geomorphic evidence suggest a zone of faulting and deformation associated with the CVFZ that may be as wide as 500-700 feet.

North Branch CVFZ

The North Branch has been exposed onsite in one trench by CHJ (T-1B) and two CHJ road cuts (SC-2 and SC-4). The north branch is characterized by steeply dipping (near vertical) faulting that is located roughly 200-300 feet north-northeast of, and roughly parallel to, the South Branch. The fault generally juxtaposes massive conglomeratic sandstone units within the San Timoteo Formation making relative offset difficult to determine. This fault was not trenched due to its location, over 200 feet north of the conceptual development footprint.

South Branch CVFZ

This fault has been exposed in CHJ trenches (T-1B, T-2, T-3, T-4) and road cuts (SC-1, SC-2 and SC-3) and in Neblett Trenches (NT-2, NT-3A, NT-5, NT-6) and in road cut RC-1. It is characterized by a northwest to east-west trending, north dipping reverse fault. Dips are low to moderate angle (10-45 degrees). Drag folding along the main rupture observed and logged by both CHJ and N&A indicate reverse/thrust kinematics. Relative offsets were not measurable in exposures and trenches but are significant, as the fault juxtaposes older San Timoteo (Plio- Pleistocene) over relatively younger alluvial units. Significant changes in stratigraphy, topography, geomorphology, and streamflow direction, are present along the entire mapped trace of this fault. This fault was the central focus of the Supplemental Fault Investigation (9/22/08), due to its potential effect on the conceptual development footprint.

4.0 Activity of Faulting:

During the fault investigation, N&A did not attempt to age-date the South Branch of the Cherry Valley fault or the North Branch of the Cherry Valley fault. The fault investigation concentrated on refining the location and attitude of the South Branch of the Cherry Valley fault in order to position future structures outside the restricted use zone at final grades. No unbroken datable soil horizons or other unbroken pre-holocene units were exposed in any of the N&A excavations. In addition, no carbon or datable materials were encountered in any of the excavations.

It is our opinion that there is no direct evidence to designate the South Branch and North Branch of the Cherry Valley fault, and any possible faults northeast (within the property limit) of the South Branch of the Cherry Valley fault, as inactive. In addition, there is relatively strong geomorphic and topographic evidence that indicate that the Cherry Valley Fault Zone is potentially active. Consequently, N&A has delineated a setback for the South Branch and "Recommended Restricted Use Zone" from the South Branch extending to the north and northeast property line as shown on Figure 4. No evidence of faulting was observed southerly of the South Branch CVFZ in any of the excavations.

CVAR_09697

Based on the results of N&A's fault investigation (9/22/08) using aerial photo lineament analyses, fault trenching, geologic field mapping, observation of exposed roadcuts, and review of previous fault investigations by others, N&A has successfully located the South Branch of the CVFZ onsite (Figure 4). These analyses have resulted in a structural setback zone located 50 feet south of, and 100 feet to the north of the South Branch. We have also established a Restricted Use Zone (RUZ) located north and northeast of the South Branch to the north and northeast property boundary (Figure 4). If habitable structures are proposed for this area, a thorough fault investigation comparable to that previously completed, will be required.

5.0 Laboratory Analyses:

C.H.J. Inc. (8/15/05) provided a laboratory test program that included the following:

- Field moisture content determinations on all samples returned to the laboratory (results on borings logs Appendix IV)
- Field dry densities on all undisturbed ring samples (results on boring logs Appendix IV)
- Optimum moisture content – maximum dry density relationships for typical soil types to determine relative compaction and re-compaction characteristics.
- Direct shear tests on selected undisturbed samples to provide shear strength parameters for bearing capacity, earth pressure, and slope stability evaluations.
- Full-cycle consolidation testing on selected undisturbed samples for evaluation of potential hydro-consolidation.
- Sieve equivalent and R-value tests for criteria for preliminary pavement design recommendations.
- Chemical/corrosivity.

This data is presented in Appendix V of this report.

To supplement C.H.J Inc.'s laboratory test results, N&A performed the following tests:

- Field moisture content determinations on selected samples returned to the laboratory (results on borings logs Appendix II)
- Field dry densities on selected undisturbed ring samples (results on boring logs Appendix II)
- Optimum moisture content – maximum dry density relationships for selected bulk samples
- Direct shear tests on remolded samples
- Consolidation testing on selected undisturbed samples
- Grain size analyses on selected samples
- Soluble salfate content tests on selected bulk samples
- Expansion index tests on selected samples

This data is presented in Appendix V of this report.

6.0 Groundwater:

Groundwater was not encountered in any of the borings excavated onsite to a maximum depth of 71 feet. Two groundwater wells previously used for irrigation are located in the western portion of the site as shown on Figure 4.

Recent measurements of the groundwater in these wells indicate the depth to groundwater to be approximately 198 to 223 ft. below ground surface. Measurements taken by the San Gorgonio Pass Water Agency for these wells from 1963 to 2005 indicate the depth to groundwater from 150 ft. (1963) to 200 ft. (2005) below ground surface.

Based on these measurements of the regional aquifer and the absence of noted perched water in the borings, groundwater is not expected to be a constraint to the proposed development.

If the existing water wells are not to be utilized for on-site usage (i.e. irrigation), then they must be abandoned in accordance with the state and local agencies.

CVAR_09698

7.0 Geologic/Seismic Considerations for EIR:

7.1 Regional Faulting and Seismicity:

G&A has provided a Probablistic Seismic Hazard Analysis for peak ground acceleration and CBC Seismic design parameters using the Earthquake Ground Motion parameters Computer Program Version 5.0.9 revised 10/06/08 USGS in Appendix I.

The site's location in Southern California is in a geologically complex area with numerous fault systems including strike-slip, oblique, thrust and normal faults. The site can be expected to be subject to seismic hazards of varying degree, depending on the proximity and earthquake potential of nearby active faults and the local geologic and topographic conditions.

The site is not located within an Alquist-Priolo Earthquake Fault Zone (CGS, 2000). However, the southern portion of the site is located within a County of Riverside designated Earthquake Fault Zone, based on the Riverside County GIS Fault Zone Map. N&A conducted a Supplemental Fault Investigation (2008) delineated the South Branch of the Cherry Valley Fault Zone and concurred with C.H.J. Inc. location of the North Branch of the Cherry Valley Fault Zone. These two faults are shown on Figure 4 and only the South Branch impacts the proposed development. N&A determined there is no direct evidence that the South Branch, including the North Branch, located northeast of the South Branch, are inactive. As a result N&A has delineated a structural setback zone for the South Branch of the Cherry Valley Fault and a restricted use zone for the area northeast of the South Branch as shown on Figure 4.

N&A has designated the South Branch of the Cherry Valley Fault as potentially active which may be subject to relatively small movements at depth due to sympathetic movement from regional faults and earthquakes. Seismic hazards include primary rupturing of rock and soil materials along active fault traces, and secondary hazards resulting from strong ground shaking. G&A is in agreement with N&A's findings and designations regarding the aforementioned.

7.2 Ground Rupture:

Based on our potentially active designation for the South Branch of the Cherry Valley Fault, and a lack of evidence for the surface faulting in this area from observations by Kahle and others (1987) from a magnitude 5.9 earthquake on July 8, 1986 approximately 10km. northwest of North Palm Springs (epicenter near Mission Creek Fault), the potential for surface rupture of the

South Branch of the Cherry Valley Fault that affects the proposed development is considered remote.

7.3 Ground Shaking:

The Peak Horizontal Ground Acceleration (PHGA) for the site was estimated using USGS data (2008) based on currently available earthquake and fault information (Appendix I). Based on this information, the PHGA with a 10 percent probability of being exceeded in 50 years is estimated to be approximately 0.61g.

7.4 Liquefaction:

The majority of liquefaction hazards are associated with un-compacted, saturated or nearly saturated, non-cohesive sandy and silty soils (Martin and Lew, 1999; CDMG SP117, 1997). Based upon field mapping and the subsurface exploration, the older alluvium consists of unsaturated clayey to silty sands with frequent gravel and gravelly sand lenses; the younger alluvium consists of unsaturated silty sands and lesser gravelly sands; and the San Timoteo Formation (bedrock) consists of unsaturated cobble-boulder conglomerate with minor fine to medium grained sandstones. The removals of the upper portions of the younger alluvium will generate fills consisting of similar materials to attain proposed grades.

In view of the absence of perched groundwater and the 200-300 ft. depth of the regional groundwater, the potential for liquefaction is considered low.

7.5 Hydroconsolidation:

A significant portion of the site is mantled by young alluvium (Qya). Laboratory testing and SPT data by this firm and others indicates the younger alluvium to be on the order of 20ft. in depth and is in a loose to medium dense state and relatively dry.

Although the regional groundwater is at 200ft. to 300ft. below ground surface and can be ruled out as a potential source for hydrocollapse, shallow perched groundwater from landscape irrigation may saturate some areas and result in hydroconsolidation. C.H.J. evaluated the potential hydroconsolidation of the loose soils with testing on selected samples. Their results indicate a mild to high potential of hydroconsolidation.

Mitigation of this potential hazard will involve complete removal of the younger alluvium (Qya) approximately 20ft. in depth and replacement with compacted engineered fill to the design

CVAR_09699

grades. Minimizing the irrigation by planting drought-resistant vegetation will also benefit. It is also noteworthy that, based upon the proposed plan, a minimal surface area will be exposed to receive irrigation and/or rainfall since the majority of the site will direct water from the large buildings, parking lots and driveways to the storm drain system. The proposed drained stabilization fill prisms and fill slopes will also reduce the hydroconsolidation potential.

7.6 Settlement:

Some settlements are expected to occur due to seismic activity (ground shaking), loading from compacted fill placement, and loading from proposed structures.

Due to the removal of the younger alluvium (Qya) and replacement with compacted fill seismically induced settlement caused by groundshaking is expected to be generally uniform.

The area loading from compacted fill placement will cause settlement due to the compressibility of the fill materials and will include immediate (elastic) and long-term (primary and secondary) settlements. The magnitude of fill settlements would depend on the thickness and the compressibility characteristics of compacted fill and the underlying older alluvium (Qoa). The elastic component of fill settlement will be immediate and will be complete upon placement of fill. The primary and secondary fill settlements are time-dependent and will occur over a long period.

We propose positioning settlement monuments at strategic locations in the deeper fill areas as shown on Figure 4. These will be monitored on a regular basis until the primary settlement has stabilized.

7.7 Landslides:

No landslides or other evidence of gross slope instability were observed during our investigations onsite and no landslides are denoted on the published geologic maps and aerial photographs reviewed within and adjacent to the site.

Stability of slopes within the San Timoteo Formation is generally considered moderate to locally poor. The proposed cut slope north of Building 2 will expose San Timoteo Formation bedrock which will likely reveal day-lighted bedding conditions, and a small area of non-engineered fill which will require removal and replacement with compacted engineered fill is located in the cut slope east of Building 2. As a result, we propose a stabilization fill prism for this cut slope as shown on Figure 4 and cross-sections 1-1' and 3-3'. During construction, these conditions will be observed and additional recommendations will be provided, as appropriate.

7.8 Erosion/Debris Flows:

Loose surficial soils mantle the natural slopes within the proposed sphere of development which are prone to erosion resulting in shallow surficial failures and debris flow. Also, two relatively broad drainage channels that trend southwesterly towards the western portion of the development site, and an east-west to southwest trending drainage channel in the northeast portion of the site, have the potential for water surface flows and debris flows.

The project civil engineering group – Hunsaker & Associates, Inc. has designed two debris basins for the two drainages in the northwest portion of the site. A protective berm is located along the top of the north perimeter cut slope north of Building 2 and 1 as shown on Figure 4 and Cross-Section 2. Brow ditches and interceptor swales have also been incorporated by Hunsaker & Associates to control surface drainage. The installation of these designed devices to protect the slopes and control surface drainage will help mitigate the potential erosion and debris flow during storm events.

The slopes should be planted as soon as possible upon completion of grading with drought-resistant plants to help mitigate surficial erosion.

7.9 Slope Stability:

Global and surficial slope stability analyses were performed to evaluate the stability of the largest engineered fill slope and the largest cut slope in older alluvium. Detailed slope stability analyses are presented in Appendix VI. The results of the stability analyses indicate that the proposed slopes will provide factors of safety greater than 1.5 and 1.1 under static and pseudo-static conditions, respectively, conforming to the County of Riverside standards and are acceptable as planned. Similarly, the factors of safety for the surficial stability conditions also meet the required minimum safety factor of 1.5.

8.0 Shrinkage:

The source of the fill materials for grading operations include younger alluvium (Qya), older alluvium (Qoa), and San Timoteo bedrock formation (Tst) which will shrink when excavated and re-compacted. We estimate the following earth volume changes will occur during grading:

Younger Alluvium (Qya) Approximately 15-20% shrinkage

Older Alluvium (Qao) Approximately 10-15% shrinkage

CVAR_09700

San Timoteo Formation (Tst) Approximately 5% shrinkage

The designated project Civil Engineer should incorporate these shrinkage factors when balancing the earthwork volumes.

9.0 Infiltration Rate:

The results of double ring infiltrometer test performed in locations IF-1 through IF-4 are summarized in the following table:

Test Location	No of Trials Performed Until Steady State	Time Interval	Volume of Water Needed in Inner Ring in Each Trial at Steady State	Infiltration Rate (in./hr)
IF-1	18	5 mins (0.0833 hr)	14 $in.^3$	1.5 in./hr
IF-2	16	5 mins (0.0833 hr)	28 $in.^3$	3.0 in./hr
IF-3	16	5 mins (0.0833 hr)	23 $in.^3$	2.4 in./hr
IF-4	20	5 mins (0.0833 hr)	11.5 $in.^3$	1.2 in./hr

The results of the well permeameter test results at the steady state (number of total trials performed until steady state percolations is 16) are as follows:

Hole diameter = 8 inches

Total hole depth = 46 feet (552 inches)

Initial water depth at steady state = 36 feet (432 inches)

Final Water depth at steady state = 37.55 feet (450.6 inches)

Time interval Δt = 10 minutes

In order to calculate the infiltration rate as described in Section 5.4, the above data should be reduced as below:

r = 4 inches

H_{ave} = [(552-432) + (552-450.6)]/2 = 110.7 inches

ΔH = 450.6-432 = 18.6 inches

Calculated Infiltration Rate $I_t = \Delta H (60r)/ \Delta t(r + 2 H_{ave})$

I_t =(18.6 in) (60 min/hr) (4 in)/ (10 min) ((4 in) + 2 (110.7 in))

I_t = 2.0 in./hr

10.0 Recommendations and Conclusions

10.1 General:

Based on the results of our investigation, engineering analyses and evaluations, combined with our professional experience and judgment, it is our opinion that, from a geologic and geotechnical engineering standpoint, the site is considered suitable for the proposed development. The planned commercial buildings can be supported on conventional spread and continuous footings, provided the recommendations presented herein are incorporated into the design and implemented during construction.

Preliminary geotechnical recommendations for site grading and foundation design and construction are presented below. As grading and foundation plans are completed, they should be forwarded to our office for review to verify conformance with the intent of these recommendations, and to enable us to provide additional/revised recommendations, as appropriate.

10.2 Site Grading

10.2.1 Site Clearing and Preparations:

a) Precautions should be taken during the performance of all work and at all times, to protect the work site, particularly excavated areas, from flooding, ponding and inundation due to poor or improper temporary surface drainage. During periods of impending inclement weather, temporary provisions should be made to adequately direct surface drainage away from all sources and off the work site and also provide adequate pumps and sumps to handle any flow into the excavations.

b) All site preparation as indicated below should be made under the periodic observation of the Project Geotechnical Engineer or Project Geologist.

c) Prior to the start of the grading and earthwork operations, all excess vegetation, surface trash, debris and other deleterious materials should be removed and wasted away from the site.

10.2.2 Remedial Grading:

a) Overexcavation:

In cut areas where the building foundations transgress older alluvium (Qoa) or San Timoteo Formation (Tst), we recommend a 10 ft. deep overexcavation and replacement with compacted engineered fill. The width of the overexcavation should extend a minimum of 5ft. beyond the edge of the footings. This 10ft. deep overexcavation will also apply to the interior footings for columns, etc. The remaining slab areas will require a 5 ft. minimum deep overexcavation.

The younger alluvium (Qya) will require a complete removal and replacement with engineered fill to the proposed grades. In general, the depth of removal is approximately 20 ft. from existing ground surface. Deeper removals may be required in localized areas. The project geologist should be present during these removals to observe and approve the subgrade.

b) Stabilization Fill

Where loose, unsuitable soils are anticipated to be exposed in cut slopes, stabilization fills will be required. These stabilization fill prisms will be drained in accordance with the grading details (Appendix VII) and have keyway dimensions from 20' x 2' x 3' (width, to depth, heel depth) to 40' x 2' x 3'. Stabilization fills are also required for fill over cut conditions in slope areas.

c) Fill Placement

After approval of the overexcavations discussed above, the exposed bottoms should be surveyed by the Project Civil Engineer. Prior to placement of any compacted engineered fill materials, the excavation bottom should be scarified to a minimum depth of six(6) inches, moisture conditioned to approximately 2 percentage points above optimum

CVAR_09701

moisture content, and then rolled and compacted to at least 90 percent relative compaction (ASTM : D1157) with suitable compaction equipment. The Project Geotechnical Engineer or Project Geologist should evaluate and approve the acceptability of the compacted excavation bottom prior to placement of the new fill materials.

10.2.3 Fill Materials:

a) The excavated on-site soils may be used as compacted fill. The fill materials to be used as compacted engineered fill should be free of organics, debris, deleterious materials, and rocks over 6 inches maximum dimension, and must be approved by the Project Geotechnical Engineer or Project Geologist prior to use.

b) Import soils, if required, should be evaluated by the Project Geotechnical Engineer for suitability prior to delivery. Import soils should be free of trash, debris or other objectionable materials. All import fill should have engineering characteristics similar to the on-site soils.

c) Plans and specifications should indicate that the grading contractor shall notify the Project Geotechnical Engineer not less than 72 hours in advance of the location of any soils proposed for import. Each proposed import source shall be sampled, tested and approved prior to delivery of soils for use on the site.

10.2.4 Fill Placement, Moisture Conditioning, and Compaction:

a) Approved on-site or imported soils, should be spread in thin loose lifts (not exceeding six inches in thickness), moisture conditioned to approximately 2 percentage points above the optimum moisture contents, and each lift rolled and compacted to minimum 90 percent of the applicable laboratory maximum dry density (ASTM: D 1557), until the desired grades are achieved. No jetting or flooding is allowed.

b) Compacted fill areas not meeting the specified relative compaction should be moisture conditioned, as appropriate, and re-compacted, until the required compaction is achieved.

CVAR_09702

10.2.5 Earthwork Observations and Testing:

a) The site preparation, over-excavation, and earthwork should be performed under the observation and testing by a representative of the Project Geotechnical Engineer or Project Geologist.

b) The fill should be tested at the time of placement to verify that the required compaction is achieved.

c) The fill compaction should be determined in the field by the Sand Cone Method (ASTM: D 1556) or Nuclear Gauge Method (ASTM: D 2216), or other test method approved by the Project Geotechnical Engineer.

d) During grading, an adequate number of field density tests should be performed using approved test procedures in order to determine compliance of earthwork to the project requirements. The frequency of field density testing should be in accordance with the recommendations of the Project Geotechnical Engineer and must comply with the minimum requirements of the City of Riverside.

e) Quality control testing performed to determine the acceptability of the fill compaction should be based on the laboratory maximum dry density and optimum moisture content determined in accordance with ASTM: D 1557 test procedure.

f) Any surface or subsurface obstructions, or questionable materials encountered during grading should be brought immediately to the attention of the Project Geotechnical Engineer. Deeper excavations may be required, should unsuitable soils be encountered locally, as determined by the Project Geotechnical Engineer and/or Project Geologist.

10.3 Temporary Excavations:

The backcuts for the stabilization fills subjacent to Cherry Valley Boulevard should be excavated in appropriate increments to be determined in the field by the project engineering geologist to minimize backcut failures and time of exposure.

Temporary excavations exposing younger alluvium (Qya) deeper than 4 feet should be sloped no steeper than 1H:1V or shored in accordance with Cal OSHA requirements.

Our office should review soil conditions exposed during excavations to verify acceptability of temporary slopes. Final temporary backcut slope design will be dependant upon the soil

conditions encountered, construction procedures and schedule. Temporary backcuts should not be left open for extended periods of time.

10.4 Foundation Design:

The planned commercial structures may be supported on conventional continuous and spread footings bearing on compacted engineered fill.

At the time of this report preparation, foundation details and loads were not available. These should be reviewed during the precise grading plan review to confirm the geotechnical recommendations provided herein and to develop supplemental recommendations, if required. The preliminary geotechnical design criteria applicable to the subject development are summarized below:

Allowable Bearing Pressure (1) = 1,500 psf

Minimum Footing Depth (2) = 24 inches

Minimum Footing Width = Per 1997 U.B.C.

Passive Soil Pressure (3) = 250 psf/ft., subject to a maximum of 2,000 psf

Friction Coefficient = 0.35 (ultimate)

Minimum Footing Reinforcement = Four No. 4 bars, 2 each at top and bottom

(1) The above value may be increased 250 lbs./sq.ft. for each additional foot exceeding the minimum embedment depth and/or width, subject to a maximum of 2,500 psf. Allowable bearing pressures may be increased by one-third for short term loading due to wind or seismic forces.

(2) Footing depth is below lowest adjacent soil grade.

(3) Passive soil pressure value is for level soil conditions adjacent to footings.

CVAR_09703

General Remarks

a) Foundation details such as concrete strength, reinforcements, etc. should be established by the Project Structural Engineer, considering the soil expansion potential and loading and service conditions. The reinforcements shown should be considered as minimum requirements. The footings should be adequately reinforced based on structural design considerations and/or Code requirements.

b) Isolated column footings should be tied together by grade beams in at least two (2) orthogonal directions.

c) Foundation excavations should be observed and approved by the Project Geotechnical Engineer prior to the placement of reinforcement or concrete. Forming of footing excavations may be required. Excavations should be free of slough and debris and thoroughly moisture conditioned prior to placing concrete.

d) Excavated materials from footings and utility trenches should not be placed in slab-on-grade areas unless properly compacted and tested.

10.5 Settlements

Fill Settlement:

The area loading from compacted fill placement will cause settlement due to the compressibility of the fill materials and underlying alluvium. The magnitude of settlements would depend on the thickness and the compressibility characteristics of compacted fill and underlying stratum. Preliminary settlement evaluation based on the compressibility characteristics of the compacted fill indicate that the total fill settlement (during and post-grading) for fill depths generally less than 40 feet or less would be small. We propose positioning settlement monuments at strategic locations in the deeper fill areas as shown on Figure 4. These will be monitored on a regular basis until the primary settlement has stabilized before those areas released for construction.

Structure Settlement:

For purpose of settlement evaluation, it is assumed that the structural loading would be typical for one-story, tilt-up or wood-frame-type construction (column and wall loads not exceeding 100 kips and 3 kips/lineal foot, respectively).

Total static settlements of continuous and spread footings supporting the above typical structural loading and designed in accordance with the above recommendations are not

anticipated to exceed one inch. Differential settlements between similarly loaded column footings and for continuous footings over a distance of 30 feet are not expected to exceed ¾-inch.

10.6 Floor Slab-on-Grade:

The compacted engineered fill underling the site generally consists of clayey and silty sands with low soil expansion potential.

Structural and/or construction loading considerations will govern slab design and should be evaluated by the Project Structural Engineer.

In areas where a moisture sensitive floor covering will be used, the floor slab-on-grade should be underlain by a moisture/water vapor retarder, as recommended in Section 7.6 below.

Recommended criteria for slab-on grade are shown below:

Concrete Floor Slabs

Concrete floor slabs should be 5 inches thick (minimum) and should be reinforced with No. 3 bars at 18 inches on center, each way at mid height. No. 3 bars at 18 inches on center should be provided connecting floor slabs to footings. In order to minimize migration of moisture up the concrete slab from soil subgrade and damage to floor coverings, a moisture barrier/water vapor retarder recommended beneath floor slabs as discussed hereinafter.

Driveway

Driveway concrete slabs should be 5 inches thick (minimum) with No. 3 bars at 18 inches on center, each way at mid-height. The slab may be placed directly on properly prepared sub-grade. No moisture barrier is required under driveway slabs.

Exterior Flatwork

Exterior concrete flatwork (e.g. sidewalks, walkways) should be 4 inches thick (minimum), with No. 3 bars at 24 inches on center, each way at mid-height and placed on properly prepared sub-grade. Hardscape areas within two feet of the descending slopes should include a thickened edge deepened to provide a minimum five (5) feet horizontal setback between the bottom outside face of the thickened edge and slope face.

Sub-grade Pre-saturation

Prior to concrete placement, the soil sub-grade should be thoroughly wetted to about 12 inches in depth at a moisture condition of about 2 to 3 percentage points above the optimum moisture content.

General

Interior floor slabs and exterior concrete flatwork, including driveway, should be properly designed for the construction and service loading conditions, potential settlements and soil expansion. The structural details, such as slab thickness, concrete strength, reinforcing criteria, joint spacing, etc. should be established by the Project Structural Engineer. The recommended minimum reinforcements for concrete slabs provided above are intended for preliminary design only. More restrictive criteria as dictated by structural design or regulatory requirements shall govern.

10.7 Moisture/Water Vapor Mitigation for Concrete Slab-on-Grade:

In order to reduce the potential for moisture/water vapor migration up through the slab and possibly affecting floor covering, a moisture/vapor retarder is recommended under concrete floor slab-on-grade. The moisture barrier should be properly installed, lapped and sealed in accordance with the manufacturer's specifications. Punctures and rips should be repaired prior to placement of sand.

As a minimum, this moisture/water vapor retarder should consist of 10-mil thick polyethylene ("Visqueen"), lapped and sealed, and placed mid-height within a 4-inch coarse sand layer. This moisture/water vapor retarder should be installed in accordance with manufacturer's specifications.

The following recommendations are based on the tentative guidelines by the American Concrete Institute (ACI, April 2001) to reduce the potential moisture/water vapor intrusion in concrete slab-on-grade. Based on our review of available literature, it appears that the ACI procedure would be more effective to help reduce potential moisture/water vapor migration up through concrete slab-on-grade.

CVAR_09704

Recommendations based on the ACI guidelines are presented below:

- The moisture/water vapor retarder should consist of high strength polyethylene membrane and should meet or exceed the ASTM: E-1745-97 Class C material requirements for water vapor permeance, tensile strength and puncture resistance. The vapor retarder should consist of "Moistop Plus" (Fortifiber Building Products Systems) or "Vapor Block" VB 15 (Americover, Inc.), or approved equal. The vapor retarder should be underlain by a capillary break comprised of minimum 4 inches thick pea gravel layer. The gravel layer should be placed and compacted on approved soil sub-grade.
- The membrane should be placed on approved gravel layer and properly lapped and sealed. Membranes intersecting utility pipes, sewer lines, ducts or drains must be properly wrapped around the penetrations and sealed. All punctures and rips in the membrane should be repaired prior to placement of concrete, following manufacturer's recommendations. The vapor retarder should be installed in general accordance with the procedures outlined in ASTM: E-1643, and in conformance with the installation procedures recommended by the manufacturer.
- To minimize slab curling, a low slump concrete (low shrinkage mix design) should be used for the slab construction, as determined by the Project Structural Engineer.

The moisture/water vapor protection for concrete slab-on-grade should be selected based on cost and construction considerations, and considering potential future problems resulting from improper and uncontrolled landscape irrigation practices. Regardless of the moisture/water vapor retarder option selected, it should be emphasized that proper control of irrigation and landscape water adjacent to the structure is of paramount importance.

10.8 Depressed Loading Dock Retaining Walls

Presented below are recommended criteria for the design and construction of planned depressed loading dock retaining walls:

A. Retaining wall footings should be supported on approved engineered fill.

B. The wall footings may be designed based on a maximum allowable soil pressure of 1,500 psf. For retaining walls, the recommended minimum footing depth is 2 feet below the lowest adjacent soil grade.

C. For level soil conditions in front of wall, a passive earth pressure value of 250 psf/ft may be used in the design of footings. A friction coefficient of 0.35 (ultimate) may also be used between the base of footing and supporting soils.

D. Continuous footings should be designed to accommodate potential total and differential settlements on the order of 1 inch and 3/4-inch in 30 feet horizontal distance, respectively.

E. Retaining walls should be adequately designed to resist the lateral soil pressures and the anticipated construction loadings and service conditions. The earth pressure acting on retaining walls depends primarily on the allowable wall movement, type of backfill materials, backfill slopes, wall inclination, surcharges, and any hydrostatic pressure. The following minimum lateral earth pressures are recommended for vertical walls with level backfill, no hydrostatic pressure and no surcharge:

Wall Condition	Lateral Earth Pressure (Equivalent Fluid Pressure) (pcf)
Active	40
At Rest	60

The above values are applicable to non-expansive, granular backfill (sands) placed between the wall stem and an imaginary plane rising at 45 degrees from below the edge (heel) of the wall footings, compacted to minimum 90 percent relative compaction (ASTM: D1557) at 1 to 2 percentage points wet of optimum moisture conditions.

F. The surcharge effect of anticipated adjacent loads on the wall backfill (e.g., traffic, footings) should be included in the wall design. If the wall is free to deflect, additional lateral pressure equal to 33 percent of the maximum surcharge load located within a distance equal to the height of the wall should be used in design.

G. The wall design should include water-proofing (where appropriate) and weep holes or back-drains for relieving possible hydrostatic pressure. The back-drain should consist of perforated Schedule 40 PVC pipe, minimum 4-inch diameter, embedded in minimum 3 cft/ft of gravel and enveloped in MIRAFI 140 geofabric or approved equal. The drain pipe should be installed at a minimum gradient of 1 percent and should discharge into suitable outlet.

CVAR_09705

H. No backfill should be placed against concrete until minimum design strengths are attained, as determined by concrete compression tests.

I. Retaining wall backfill should be mechanically compacted to minimum 90 percent relative compaction (ASTM: D 1557). No ponding, jetting or flooding, should be permitted.

J. In order to reduce the potential surface water migration into the backfill material, the uppermost two (2) feet of backfill material should consist of onsite clayey soils, compacted to at least 90 percent relative compaction (ASTM: D1557) at approximately 3 percentage points wet of optimum moisture conditions.

K. Retaining wall plans and details should be provided to our office for review, when available, in order to verify the applicability of the preliminary recommendations presented herein, and to enable our office to provide additional/revised recommendations, as appropriate.

10.9 Seismic Design Considerations:

The site, as is all of southern California, is within a zone of seismic activity. Strong ground motion from an earthquake generated along active faults should therefore be anticipated at this site. The proposed development should be designed and constructed to the prevailing seismic design standards. Seismic design should be based on current and applicable CBC requirements as appropriate. The CBC seismic design parameters using earthquake ground motion parameters computer program version 5.0.9 revised 10/6/08 USGS are presented in Appendix IV.

10.10 Expansive Soils:

In general, the site sub-grade soils are granular with very low soil expansion potential. Specialized construction procedures to specifically resist expansive soil forces are not anticipated at this time. Additional evaluation of soils for expansion potential should be conducted by the geotechnical engineer during the grading operations.

10.11 Soil Corrosion:

C.H.J. Inc. (Aug. 2005) selected samples of material and delivered them to M.J. Schiff & Associates, Inc. for soil corrosivity tests. Laboratory testing consisted of pH, resistivity, and

major soluble salts commonly found in soils. The results of the laboratory test performed by M.J. Schiff & Associates, Inc. are enclosed in Appendix V.

These tests were performed in order to screen the site for potentially corrosive soils. Although C.H.J. Inc. acknowledges that they do not practice corrosion engineering, they considered the values from the soil tested are considered mildly corrosive to ferrous metals at the site. No specific corrosion control measures, such as coating of the pipe with non-corrosive material or alternative non-metallic pipe material, are considered to be necessary.

C.H.J. Inc. indicates the results of soluble sulfate testing indicate a "negligible" anticipated exposure to sulfate attack, as indicated in the enclosed test results (Appendix VI). Based on the criteria from Table 4.3.4 of the American Concrete Institute (ACI) Manual of Concrete Practice (2000), no special measures, such as specific cement types, water-cement ratios, etc. will be needed for this "negligible" exposure to sulfate attack.

The Soluble chloride content of the soil was not determined to be at levels high enough to be of concern with respect to corrosion of reinforcing steel. The results should be considered in combination with the soluble chloride content of the hardened concrete in determining the effect of chloride on the corrosion of reinforcing steel.

Additional soil corrosion testing of exposed foundation materials should be performed during or near completion of site grading.

11.0 Utility Trench Backfill:

Bedding material should consist of on-site sandy or imported materials exhibiting a San Equivalent (S.E.) value of 30 or greater.

The on-site soils are considered suitable for trench backfill, provided they are free of organic materials and oversize rocks.

Backfill of all exterior and interior trenches should be placed in thin lifts not exceeding 4 inches and mechanically compacted to achieve a relative compaction of not less than 90% based on ASTM: D1157. Care should be taken not to damage utility lines.

Utility trenches should not be located within the influence of footings. This is defined as a zone located below the footing and a line sloping at an inclination of 1:1 (horizontal to vertical) outward from the outside edge of footings. If utility lines are located within the zone of footings, the backfill should be

CVAR_09706

compacted to a minimum 95 percent relative compaction or slurry backfilled (minimum 1-1/2 sack cemented sand mix.

To reduce potential water migration into building sub-grade through the granular bedding/shading layer and/trench backfill, utility trenches should be backfilled with the onsite finer grained materials or sand-cement slurry for minimum 3 feet length at their entry points.

Trenches in fill soils and alluvial deposits greater than 4 feet in depth should be shored or sloped back as required by the local regulatory agency, the state of California Division of Industrial Safety Construction Safety Orders, and Federal OSHA requirements.

12.0 Asphalt Concrete Pavement:

Preliminary asphalt concrete pavement sections for the planned commercial/industrial development were developed utilizing the Cal Trans Method of Design and the Structural Section Design Guide for California Cities and Counties.

The following recommended pavement sections were computed assuming an "R" value of 30 for site soils compacted as sub-grade material, and assumed traffic indices. The actual "R" value will depend on the soil conditions exposed at the planned street sub-grade elevations.

During rough grading, "R" value testing should be performed on the pavement sub-grade soils to confirm the pavement design basis. Further analysis and evaluation are necessary, if the design traffic index and the sub-grade "R" value are different from those used in our analyses.

Pavement Utilization	Traffic Index	Asphalt Pavement Section (inches)		
		AC	AB	Total
Circulation Driveways	7.0	4.0	10.0	14.0
Parking Areas	5.0	3.0	6.0	9.0

Note: AC = Asphalt Concrete, AB = Aggregate Base

Aggregate base should consist of crushed aggregate base (CAB) or crushed miscellaneous base (CMB) and should comply with the specifications outlined in the "Standard Specifications for Public Works Construction", ("Green Book"). The base material should be compacted to minimum 95 percent of the maximum laboratory density, determined in accordance with ASTM: D-1557.

The soil sub-grade should be compacted to minimum 90 percent relative compaction. The subgrade soils should exhibit a firm and unyielding surface, in addition to the recommended minimum compaction. Final compaction and testing of pavement sub-grade should be performed just prior to placement of aggregate base.

13.0 Site Drainage:

All roof and surface drainage should be directed away from structures and their appurtenances and slope s to approved drainage facilities. Ponding of water should be avoided. For graded soil areas, a minimum gradient of 2 percent away from structures should be maintained.

The recommended drainage patterns should be established at the time of fine grading and maintained throughout the life of the structure or, if altered, should be replaced with a properly designed area drain system.

Irrigation activities at the site should be monitored and controlled to prevent overwatering. Planter areas adjacent to structures should be avoided. If utilized, such planters should include measures to contain irrigation water and prevent moisture migration into walls and under foundations and slabs-on-grade.

14.0 Landscape, Irrigation and Maintenance:

General guidelines for landscape, irrigation and maintenance are shown below:

A. Landscape planting should consist of appropriate drought resistant vegetation as recommended by the Landscape Architect. Landscaping should be completed as soon as possible and properly maintained.
B. Proper irrigation and maintenance and repair of installed irrigation systems are essential to minimize ground saturation. Leaks should be repaired immediately. Sprinklers should be adjusted to provide maximum coverage with a minimum of water usage and overlap. Over-watering with consequent excessive runoff and ground saturation must be avoided.
C. If automatic sprinkler systems are installed, their use must be adjusted to account for natural rainfall conditions.
D. All drainage devices that have been installed must be maintained and cleaned.

CVAR_09707

15.0 Plan Review, Observations, and Testing:

Ginter & Associates, Inc. should be provided with precise grading and foundation plans, when available, for our review to evaluate the preliminary recommendations presented herein and to develop additional/revised recommendations, as appropriate.

Field observation and testing during precise and remedial grading must be performed by a representative of this firm to verify conformance of the earthwork to the requirements of the regulating agencies, the project specifications, and the recommendations presented in this report. Any earthwork performed in connection with the subject project without the full knowledge of, and not under the direct observation of this firm, will render the recommendations of this report invalid.

16.0 Limitations:

This report has been prepared for the exclusive use of TSG Cherry Valley, L.P. and its design consultants relative to the design and construction of the proposed project. This report is not intended for other parties, and it may not contain sufficient information for other purposes.

The Owner or Owner Representative should make sure that the information and preliminary recommendations presented in this report are brought to the attention of the Project Architect and Project Engineer and incorporated into the project plans.

The findings contained in this report are based upon our evaluation and interpretation of the information obtained from limited borings and/or test pits and the results of the laboratory testing and engineering analysis. The opinions and recommendations provided were based on the assumption that the geotechnical conditions, which exist across the site, are similar to those observed in the test excavations. The condition and characteristics of the sub-surface materials at locations and depths other than those excavated and observed may be different and no representations are made as to their quality and engineering properties. Should any conditions encountered during construction differ from those described herein, this office should be contacted immediately for evaluation of the actual conditions and for appropriate recommendations prior to continuation of work.

The findings and recommendations presented herein were obtained in accordance with currently accepted professional engineering principles and practices in the field of geologic and geotechnical engineering and reflect our best professional judgment. We make no other warranty, either express or implied.

CVAR_09708

We thank you for the opportunity to provide our services for your project and look forward to working with you and the project team during site grading, design and construction. If you have any questions or require additional information, please contact the undersigned.

EL CASCO MAP (DF-113)

LEGEND

Qa / Qg

SURFICIAL SEDIMENTS
Unindurated, undissected

Qg *Alluvial gravel and sand of stream channels*
Qa *Alluvial sand, gravel and clay of level areas, covered by residual soil*

— *UNCONFORMITY* —

Qos

OLDER SURFICIAL SEDIMENTS
Weakly indurated alluvial fan deposits derived from local terrains

Qos *Alluvial gravel and sand, light reddish brown and of granitic and gneissic detritus of San Bernardino Mountains in north areas, brownish gray in south area; top surface slopes slightly from source terrains*

— *UNCONFORMITY* —

QTst / Tst — QTsg

SAN TIMOTEO FORMATION
(San Timoteo Beds of Frick, 1921) Stream laid alluvial sediments of detritus derived from plutonic and metamorphic rocks of San Bernardino Mountains NE of Banning Fault and deposited on plutonic and meta-sedimentary rocks of Peninsular Ranges NE of San Jacinto Fault zone; weakly indurated; upper part yielded vertebrate fauna diagnostic of Blancan Stage, Plio-Pleistocene (Frick, 1921, Savage et. al. 1954) or Irvingtonian Stage, earliest Pleistocene, (Repenning 1987) lower or main part inferred to be of Pliocene age (Morton and Matti, 2001)

QTst *Upper part, sandstone, light gray to tan, fine to coarse grained arkosic and minor conglomerate of mostly granitic detritus, some gneissic and quartzitic detritus; includes thin layers of soft greenish to light reddish silty claystone, overlain by older alluvium*
QTsg *Conglomerate/conglomerate, brownish gray, crudely bedded, of poorly sorted subrounded clasts of granitic and gneissic detritus in sandy matrix, base unexposed, overlain by older alluvium; probably proximal facies of upper part (QTst); exposed adjacent to Banning fault*
Tst *Main part (middle part of Morton and Matti, 2001) sandstone, minor conglomerate and claystone, similar to those of upper part; conformably overlain by upper part (QTst), conformably underlain by Mount Eden Formation (Tme), but thins and buttresses eastward onto basement rocks as shown.*

Tme / Tmeg

MOUNT EDEN FORMATION
(of Frezier, 1931), present only near and SE of Mount Eden, stream laid sediments, clasts derived from basement rocks of Peninsular Ranges, moderately lithified, conformable below San Timoteo Formation, overlies basement rocks; mostly sandstone,lithified divided into 4 members by Morton and Matti 2001; one member contains vertebrate fauna diagnostic of late Hemphillian Stage, middle Miocene, dated about 5.3 MA (Morton and Matti 2001)
Tme *Sandstone, medium grained, arkosic, includes interbeds of micaceous silty shale, strata light gray to light reddish maroon, locally contains concretions*
Tmg *Granitic conglomerate, composed of subrounded to subangular boulders and cobbles of light gray massive biotite-hornblende quartz diorite (tonalite), unsorted; form lenses within and at top of unit Tme, derived from quartz diorite to NE (Morton and Matti, 2001)*

— *UNCONFORMITY* —

gr | qdi | qdx | grq

PLUTONIC ROCKS
medium grained holocrystalline granitic rocks; age, Cretaceous

gr *Granitic rock of Mount Eden; granite to monzo-granite (Morton and Matti, 2001) composed of quartz, potassic feldspar and sodic plagioclase feldspar in nearly equal amounts but with somewhat more potassic feldspar, scattered flakes of white mica and almost no mafic minerals, nearly white, massive; intrusive into meta-sedimentary rocks; exposed only near and SE of Mount Eden*
qdi *Granodiorite of east area; composed of quartz, potassic feldspar and sodic plagioclase feldspar in nearly equal amounts but with somewhat more sodic plagioclase feldspar, minor biotite, light gray, massive to very faintly gneissoid*
qdx *Quartz diorite (Borusa Tonalite of Larsen, 1948) composed of about 1/3 quartz, 2/3 sodic plagioclase feldspar, minor potassic feldspar and 5-10% biotite and hornblende, light gray gneissoid, with abundant dark gray discoid inclusions (xenoliths) parallel to gneissoid foliation; exposed only at SW corner of quadrangle*
grq *Granite rock exposed NE of Banning fault at NE corner, of quartz monzonite composition, of quartz, potassic feldspar and sodic plagioclasefeldspar in nearly equal amounts and about 5-10% biotite as evenly scattered flakes, light gray, massive, somewhat incoherent*

hdg

HORNBLENDE DIORITE GABBRO
hdg *Mafic rock exposed at NE corner of quadrangle NE of Banning fault; gray-black, medium grained, massive, composed of about 75% hornblende, 0-30% plagioclase feldspar, locally contains green epidote as secondary veinlets; age Mesozoic (Cretaceous)*

ms | ml | mig

METASEDIMENTARY ROCKS
Remnants of metasedimentary petrolith of San Jacinto Mountains, exposed only near and SE of Mount Eden in this quadrangle; age inferred to be Paleozoic (Morton and Matti 2001)
ms *Mica schist-phyllite, composed of biotite mica, feldspar and quartz, ranges to fine grained gneiss, locally includes calcsilicate skarn, dark gray, foliated along relict bedding planes*
ml *Marble, of calcite and dolomite, pale gray to white, medium to coarse grained, indistinctly bedded, locally contains skarn of diopside, wollastonite, tosterite, garnet and graphite (Morton and Matti 2001) occurs as layers and lenses in unit ms*
mig *Mixture of metasedimentary rocks (schist–gneiss–ms) with quartz diorite (qda); complexly migmatized, at southwest corner*

gn

GNEISS
gn *Gray quartz-feldspar-biotite gneiss, thin bedded, hard but brittle; age, Precambrian (?), occurs as small pendant remnants engulfed in unit grq NE of Banning fault*

KEY TO LOGS

LEGEND OF LAB/FIELD TESTS:

Bulk	Indicates Disturbed or Bulk Sample
Consol.	Consolidation Test (ASTM D 2435)
Cor.	Corrosivity Test
Dist.	Indicates Disturbed Sample
DS	Direct Shear Test (ASTM D 3080)
MDC	Maximum Density Optimum Moisture Determination (ASTM D 1557)
N.R.	Indicates No Recovery of Sample
Ring	Indicates Undisturbed Ring Sample. Undisturbed Ring Samples are obtained with a "California Sampler" (3.25" O.D. and 2.42" I.D.) driven with a 140-pound weight falling 30 inches. The blows per foot are converted to equivalent SPT values.
SA	Sieve Analysis (ASTM C 136)
SE	Sand Equivalent Test (ASTM D 2419)
SPT	Indicates Standard Penetration Test. The SPT N-value is the number of blows required to drive an SPT sampler 12 inches using a 140-pound weight falling 30 inches. The SPT sampler is 2" O.D. and 1 3/8" I.D.

ENGINEERING PROPERTIES FROM SPT BLOWS

Relationship of Penetration Resistance to Relative Density for Cohesionless Soils*
(After Mitchell and Katti, 1981)

Number of SPT Blows (N_{60})	Descriptive Relative Density	Approximate Relative Density (%)
<4	Very Loose	0-15
4-10	Loose	15-35
10-30	Medium Dense	35-65
30-50	Dense	65-85
>50	Very Dense	85-100

* At an effective overburden pressure of 1 ton per square foot (100 kPa)

Approximate Values of Undrained Shear Strength for Cohesive Soils
(Terzaghi and Peck, 1967)

Number of SPT Blows (N_{60})	Soil Consistency	Approximate Undrained Shear Strength (psf)
<2	Very Soft	Less Than 250
2-4	Soft	250-500
4-8	Medium Stiff	500-1000
8-15	Stiff	1000-2000
15-30	Very Stiff	2000-4000
>30	Hard	More Than 4000
